The view is often defended that sciences should be built up on clear and sharply defined basal concepts In actual fact no science not even the most exact begins with such definitions The true beginning of scientific activity consists rather in describing phenomena and then in proceeding to group classify and correlate them Even at the sta e of description it is not possible to avoid applying certain abstract ideas to the material in hand ideas derived from various sources and certainly not the fruit of the new experience only Still more indispensable are such ideas—which will later become the basal concepts of the science—as the material is further elaborated They must at first necessarily possess some measure of uncertainty there can be no question of any clear delimitation of their content So long as they remain in this condition we come to an understanding about their meaning by repeated references to the material of observation from which we seem to have deduced our abstract ideas but which is in point of fact subject to them Thus strictly speaking they are in the nature of conventions although everything depends on their being chosen in no arbitrary manner but determined by the important relations they have to the empirical material—relations that we seem to divine before we can clearly recognize and demonstrate them It is only after more searching investigation of the field in question that we are able to formulate with increased clarity the scientific concepts underlying it and progressively so to modify these concepts that they become widely applicable and at the same time consistent logically Then indeed it may be time to immure them in definitions The progress of science however demands a certain elasticity even in these definitions The science of physics furnishes an excellent illustration of the way in which even those basal concepts that are firmly established in the form of definitions are constantly being altered in their content

A conventional but still rather obscure basal concept of this kind which is nevertheless indispensable to us in psychology is that of an *instinct* Let us try to ascertain what is comprised in this conception by approach g r from different angles

First from the side of physiology This has given us the concept of *stimuli* and the scheme of the reflex arc according to which a stimulus applied *from the outer world* to living tissue (nervous substance) is discharged by action *towards the outer world* The action answers the purpose of withdrawing the substance affected from the operation of the stimulus removing it out of ran e of the stimulus

Now what is the relation between *instinct* and *stimulus?* There is nothing to prevent our including the concept of *instinct* under that of *stimulus* and saying that an instinct is a stimulus to the mind But we are immediately set on our guard against treating instinct and mental stimulus as one and the same thin Obviously besides those of instinctual origin there are other stimuli to the mind which behave far more like physiological stimuli For example a strong light striking upon the eye is not a stimulus of instinctual origin it is one however when the mucous membrane of the oesophagus becomes parched or when a gnawing makes itself felt in the stomach

We have now obtained material necessary for discriminating between stimuli of instinctual origin and the other (physiological) stimuli which operate on our minds First a stimulus of instinctual origin does not arise in the outside world but from within the organism itself For this reason it has a different mental effect and different actions are necessary in order to remove it Further all that is essential in an external stimulus is contained in the assumption that it acts as a single impact so that it can be discharged by a single appropriate action—a typical instance being that of motor flight from the source of stimulation Of course these impacts may be repeated and their force may be cumulative but that makes no difference to our notion of the process and to the conditions necessary in order that the stimulus may be dispelled An instinct on the other hand never acts as a momentary impact but always as a constant force As it makes its

attack not from without but from within the
... it follows that ... can avail

... ed by the introduct on of instincts

Let us imagine ourselves ...
an almost entirely helpless living organism as yet unorientated in the world and with stimuli impinging on its nervous tissue. This organism will soon become capable of making a first discrimination and a first orientation. On the one hand, it will detect certain stimuli which can be avoided by an action of the muscles (flight)—these it ascribes to an outside world; on the other hand it will also be aware of stimuli against which such action is of no avail and whose urgency is in no way diminished by ...—these stimuli are the tokens of an inner world, the proof of instinctual needs. The apperceptive substance of the living organism will thus have found in the efficacy of its muscular activity a means for discriminating between outer and inner.

We thus find our first conception of the essential nature of an instinct by considering its main characteristics, its origin in sources of stimulation within the organism and its appearance as a constant force, and thence we deduce one of its further distinguishing features, namely that no actions of flight avail against it. Now in making these remarks we cannot fail to be struck by a fact which compels us to further admission. We do not merely accept as basal concepts certain conventions which we apply to the material we have ac...

tulates it remains for us expressly to lay stress upon. It is of biological nature and makes use of the concept of purpose (one might say of adaptation of the means to the end) and runs as follows: the nervous system is an apparatus having the function of abolishing ...

Let us for the present not take exception to the indefiniteness of this idea and let us grant that the task of the nervous system is—broadly speaking—to master stimuli. We see then how greatly the simple physiological reflex scheme ... and, being the most appropriate ... is thenceforward transmitted as an hereditary disposition. Those instinctual stimuli which emanate from within the organism cannot be dealt with by this mechanism. Consequently they make far higher demands upon the nervous system and compel it to complicated and inter-dependent activities which effect such changes in the outer world as enable it to offer satisfaction to the internal source of stimulation; above all, instinctual stimuli oblige the nervous system to renounce its ideal intention of warding off stimuli, for they maintain an incessant and unavoidable afflux of stimulation. So we may probably conclude that instincts and not external stimuli are the true motive forces in the progress that has raised the nervous system, with all its incomparable efficiency, to its present high level of development. Of course there is nothing to prevent our assuming that the instincts themselves are, at least in part, the precipitates of different forms of external stimulation, which in the course of phylogenesis have effected modifications in the organism.

Then when we find further that the activity of even the most highly developed mental apparatus is subject to the pleasure-principle, i.e. is automatically regulated by feelings belonging to the pleasure-pain series, we can hardly reject the further postulate that these feelings reflect the manner in which the process of mastering stimuli takes place. This is certainly so in the sense that "painful" feelings are connected with an increase and pleasurable feelings with a decrease in stimulation. Let us, however, be careful to preserve this assumption in its present highly indefinite form, until we succeed, if that is possible, in discovering what sort of relation exists between pleasure and pain on the one hand, and fluctuations in the quantities of stimuli affecting mental life on the other. It is certain that many kinds of these relations are possible, some of them by no means simple.

If now we apply ourselves to considering mental life from a biological point of view, an instinct appears to us as a borderland concept between the mental and the physical, being both the mental representative of the stimuli emanating from within the organism and penetrating to the mind, and at the same time a

measure of the demand made upon the energy of the latter in consequence of its connection with the body

We are now in a position to discuss certain terms used in reference to the concept of an instinct for example its impetus its aim its object and its source

By the *impetus* of an instinct we understand its motor element the amount of force or the measure of the demand upon energy which it represents The characteristic of impulsion is common to all instincts is in fact the very essence of them Every instinct is a form of activity if we speak loosely of passive instincts we can only mean those whose aim is passive

The *aim* of an instinct is in every instance satisfaction which can only be obtained by abolishing the condition of stimulation in the source of the instinct But although this remains invariably the final goal of every instinct there may yet be different ways leading to the same goal so that an instinct may be found to have various nearer or intermediate aims capable of combination or interchange Experience permits us also to speak of instincts which are *inhibited in respect of their aim* in cases where a certain advance has been permitted in the direction of satisfaction and then an inhibition or deflection has occurred We may suppose that even in such cases a partial satisfaction is achieved

The *object* of an instinct is that in or through which it can achieve its aim It is the most variable thing about an instinct and is not originally connected with it but becomes attached to it only in consequence of being peculiarly fitted to provide satisfaction The object is not necessarily an extraneous one it may be part of the subject s own body It may be changed any number of times in the course of the vicissitudes the instinct undergoes during life a highly important part is played by this capacity for displacement in the instinct It may happen that the same object may serve for the satisfaction of several instincts simultaneously a phenomenon which Adler calls a *confluence* of instincts A particularly close attachment of the instinct to its object is distinguished by the term *fixation* this frequently occurs in very early stages of the instinct s development and so puts an end to its mobility through the vigorous resistance it sets up against detachment

By the *source* of an instinct is meant that somatic process in an organ or part of the body from which there results a stimulus represented in mental life by an instinct We do not know whether this process is regularly of a chemical nature or whether it may also correspond with the release of other e g mechanical forces The study of the sources of instinct is outside the scope of psychology although its source in the body is what gives the instinct its distinct and essential character yet in mental life we know it merely by its aims A more exact knowledge of the sources of instincts is not strictly necessary for purposes of psychological investigation often the source may be with certainty inferred from the aims

Are we to suppose that the different instincts which operate upon the mind but of which the origin is somatic are also distinguished by different qualities and act in the mental life in a manner qualitatively different? This supposition does not seem to be justified we are much more likely to find the simpler assumption sufficient—namely that the instincts are all qualitatively alike and owe the effect they produce only to the quantities of excitation accompanying them or perhaps further to certain functions of this quantity The difference in the mental effects produced by the different instincts may be traced to the difference in their sources In any event it is only in a later connection that we shall be able to make plain what the problem of the quality of instincts signifies

Now what instincts and how many should be postulated? There is obviously a great opportunity here for arbitrary choice No objection can be made to anyone s employing the concept of an instinct of play or of destruction or that of a social instinct when the subject demands it and the limitations of psychological analysis allow of it Nevertheless we should not neglect to ask whether such instinctual motives which are in one direction so highly specialized do not admit of further analysis in respect of their sources so that only those primal instincts which are not to be resolved further could really lay claim to the name

I have proposed that two groups of such primal instincts should be distinguished the *self preservative* or *ego* instincts and the *sexual* instincts But this proposition has not the weight of a necessary postulate such as for instance our assumption about the biological *purpose* in the mental apparatus (see above) it is merely an auxiliary construction to be retained only so long as it proves useful and it will make little difference to the results of

opposed to the instincts pursuing a straight forward course we may regard these vicissitudes as modes of defence against the instincts

The *reversal* of an instinct *into its opposite* may on closer scrutiny be resolved into two different processes a change from active to passive and a reversal of the content The two processes being essentially distinct must be treated separately

Examples of the first process are met with in the two pairs of opposites sadism masochism and scoptophilia exhibitionism The reversal here concerns only the aims of the instincts The passive aim (to be tortured or looked at) has been substituted for the active aim (to torture to look at) Reversal of content is found in the single instance of the change of love into hate

The *turning round* of an instinct *upon the subject* is suggested to us by the reflection that masochism is actually sadism turned round upon the subject s own ego and that exhibitionism includes the love of gazing at the subject s own body Further analytic observation leaves us in no doubt that the masochist also enjoys the *act* of torturing when this is being applied to himself and the exhibitionist the exposing of someone in being exposed himself So the essence of the process is the change of the object while the aim remains unchanged

We cannot fail to note however that in these examples turning round upon the subject s self and transformation from active to passive coincide or occur in one process To elucidate the relation between the two processes a more thorough investigation must be undertaken

With the pair of opposites sadism masochism the process may be represented as follows

(*a*) Sadism consists in the exercise of violence or power upon some other person as its object

(*b*) This object is abandoned and replaced by the subject s self To ether with the turning round upon the self the change from an active to a passive aim in the instinct is also brou ht about

(*c*) Again another person is sou ht as object this person in consequence of the altera tion which has taken place in the aim of the instinct has to take over the original role of the subject

Ca e (*c*) is the condition commonly termed *masochism* Satisfaction follows in this case also by way of the original sadism the passive ego placin itself in phantasy back in its former situation which however has now been given up to another subject out ide the elf Whether there is besides this a more direct masochistic satisfaction is highly doubtful A primary masochism not derived in the manner I have described from sadism does not appear to be met with That it is not superfluous to make the assumption of stage (*b*) is quite clear when we observe the behaviour of the sadistic impulse in cases of obsessional neurosis In these we have the turning upon the subject s self without the attitude of passivity towards another the reversal has only reached the second stage Self torment and elf punishment have arisen from the desire to torture but not masochism The active voice is changed not into the passive but into the reflexive middle voice.

The conception of sadism is made more complicated by the circumstance that this instinct side by side with its general aim (or perhaps rather within it) seems to press towards a quite special aim the infliction of pain in addition to subjection and mastery of the object. Now psycho analysis would seem to show that the infliction of pain plays no part in the original aims sought by the instinct the sadistic child takes no notice of whether or not it inflicts pain nor is it part of its purpose to do so But when once the transformation into masochism has taken place the experience of pain is very well adapted to serve as a passive masochistic aim for we have every reason to believe that sensations of pain like other unpleasant sensations extend into sexual excitation and produce a condition which is pleasurable for the sake of which the subject will even willingly experience the unpleasantne s of pain Where once the suffering of pain has been experienced as a masochistic aim it can be carried back into the sadistic situation and result in a sadistic aim of *inflicting pain* which will then be masochistically enjoyed by the subject while inflicting pain upon others, through his identification of himself with the suffering object Of course in either ca e it is not the pain itself which is enjoyed but the accompanying sexual excitement and this is especially easy for the sadist The enjoyment of pain would thus be a primary masochisti aim which however can then also become the aim of the originally adistic instinct

In order to complete my exposition I wou d add that pity cannot be described as a result

Add t I V t 9 4 I I t w ks (cf The Ec m P bl m f M och m 934 C ll ted P p II) rel ti g t p bl m f t ct al I f I ha p essed th ppo lt w

of the reversal of the sadistic in tinct but eces ta es the conceptio f a *react on forma tior* gams' that in tinct (fo the diff rence see below)

Ra her dinerent and simpler results are af forded by the investigation of ano her pair of *opposites* namely those instincts whose aim is sexual gazin (coptophilia) a d self-display (the *voyeur* and *exhibit onist* tendencies as they are called in the la guage of the perver ions) Here again we may postulate the same ... ta ce (*a*) copto- ... rds an ex ... of the ob- ject and a ... the ... ilic insti ct towards a part f the subject own person therewith a transformation to passiv ty and the setting up of new aim—that of being looked at (*c*) the institution of a new subject to whom one displays neself m rder to be loo ed at. Here too t is hardly poss ble to d ubt that the acti e aim appears *before the* pa ive, that s optophilia precedes exhibit ism. But there is an important divergence from what happens in the case of sadism in that we can ecognize in the scoptophilic in tinct a yet ea lier stage than that described as (*a*) That is t say that at the beginning of its ctivity the scoptophilic instinct is uto-eroti t has indeed an object but that object is the subject s own body It is only later that the in stinct c mes (by way of compari on) to ex ha ge this object f th analogous one f the body f an the (ta e (*a*)) Now this prelimi ary age is interesting because t the urc f both the ituations represented in the resulting pair of oppos es accordin to which lement in the riginal ituation is re versed. The following might serve as schem f the coptophilic instinct

S bject look in his wn sexual rgan = bject own sexual rgan being looked t by h m lf

β bject look ing t an extraneous bject (cti scoptophilia) — γ S bject wn sexual rga being looked t by another perso (exhib tionism)

... stage th child eff rts t gain co trol f his limbs

W th regard to both these instincts just ex amined as examples, it must be said that transformation of them by a reversal from acti e to ... h sub- ... direction, even when the transformation is very exten ive The onl correct descript on of the scoptophilic instinct would be that all pha es of ts development the a to-erotic prel minary phase as well as i final acti e or pas i e form, co-exist alongs de one another and the *truth* of this tateme t becomes manifest if we base our opinion not upon the *actions* which are prompted by the in tinct but upon the mech anism of ts satisfaction. Perhaps yet another way of conceiving and representing the matter may be justified. We m y plit up th life of each i tinct into a series of *thrusts* distinct from one another in the t me f the r occur rence b t *each homogeneous within its own* period whose relat on to one another is com parable t that of success e eruptions of lava. W can then perhaps picture to oursel es that the earliest and most primitive instinct-eruption pers ts in an unchanged form and under goes no development at ll The n xt *thrust* would then f m the outset have undergone a change of form being turned fo instance, from acti e to pass e and it wou d then with this new characteri tic be superimposed upon the *earlier* layer and so *on.* So that, *if we* tak a survey of th instinctual tend ncy from its beginning up to any gi en topping point the su ces ion of thrusts which we ha e described would prese t the picture of a definite development f the instinct

The fact that at that later period of devel opm t, the instinct in its primary form may be observed ide by sid with its (pa ive) oppos te deserves t be distinguished by the highly pp opriate nam troduced by Bleuler *ambivalence*

These cons d rati ns regarding the developmental hi tory f an ins inct and the perma nent characte f the intermediate tage in it h uld make in tinct-development mo e com prehensible t us. Experience h ws that the degree f demonstrable ambi alence varies greatly in indi iduals groups and races. M ked mb alence of a in tinct in human bein t the present day may be rega ded as n archa c inheritance for we ha e rea on to suppose that the part pla ed in the life f the instinct by the acti e impulses in th ir original

Cf. precedi g footnote

form was greater in primitive times than it is on an average today

We have become accustomed to call the early phase of the development of the ego during which its sexual instincts find auto erotic satis faction *narcissism* without having so far en tered into any discussion of the relation be tween auto erotism and narcissism It follows that in considering the preliminary phase of the scoptophilic instinct when the subject s own body is the object of the scoptophilia we mu t place it under the heading of narcissism it is a narcissistic formation From this phase the active scoptophilic instinct which has left nar cissism behind is developed while the passive scoptophilic instinct on the contrary holds fast to the narcissistic object Similarly the trans formation from sadism to masochism betokens a reversion to the narcissistic object while in both cases the narcissistic (active) subject is exchanged by identification for another ex traneous ego Taking into consideration the preliminary narcissistic stage of sadism con structed by us we approach the more general view that those vicissitudes which consist in the instinct being turned round upon the sub ject s own ego and undergoing reversal from activity to passivity are dependent upon the narcissistic organization of the ego and bear the stamp of that phase Perhaps they represent attempts at defence which at higher sta es of the development of the ego are effected by other means

At this point we may remember that so far we have discussed only two pairs of instincts and their opposites sadism m1 o h — 1

1e other components of the later sexual function are at present too inac cessible to analysis for us to be able to discuss them in a similar way In general we can assert of them that their activities are auto erotic i e their object becomes negligible in compari on with the organ which is their source and as a rule the two coincide The object of the scopto philic in tinct although it also in the first in stance is a part of the subject s own body

ern and L Jekels the form and function of the organ determine the activity or passivity of the instinct s aim

The transformation of the *content* of an instinct into its opposite is ob rved in a s t instance only—the changing of *love* *into* *h* *e* It is particularly common to find both these directed simultaneously towards the same ob ject and this phenomenon of their co-exis ence furnishes the most important example of am bivalence of feeling

The case of love and hate acquires a special interest from the circumstance that it resists classification in our scheme of the in tincts It is impossible to doubt the existence of a most intimate relation between these two con trary feelings and sexual life but one is na u rally unwilling to conceive of love as bei g a kind of special component instinct of sexuality in the same way as are the others just di cussed One would prefer to regard loving rather as the expression of the whole sexual current of feel ing but this idea does not clear up our difficul ties and we are at a loss how to conceive of an essential opposite to this striving

Loving admits of not merely one but of three antitheses First there is the antithesis of loving—hating econdly there is loving—be ing loved and in addition to these loving and hating to ether are the opposite of the condi tion of neutrality or indifference The second of these two antitheses loving—being loved cor responds exactly to the transformation from active to passive and may be traced to a primal situation in the same way as the scoptophilic instinct This situation is that of *loving one self* which for us is the characteristic of nar cissism Then according to whether the elf as object or subject is exchanged for an extra e ous one there results the active aim of loving or the passive one of being loved the latter re maining nearly related to narcissism

Perhaps we shall come to a better under standing of the manifold opposites of lovin if we reflect that our mental life as a who e is governed by *three polarities* namely the fol lowing antitheses

Subject (ego)—Object (external wo ld)
Ple sure—Pa n
Act ve—Pas ve

The antithesis of ego—non-ego (outer) ie subject—object is as we have already said thrust upon the individual being at an early stage by the experience that it can abolish ex

1 u recuy pre supposes n object other than itself even thou h that object be part of the subject s own body In the auto erotic instincts the part played by the organic source is so decisive that according to a plausible supposition of P Fed

Z *t* *k* *ft* V I I (9 3)

ternal stimuli by means of muscular action but is defenceless against those stimuli that originate in instinct. This antithesis remains sovereign above all in our intellectual activity and provides research with a fundamental situation which no amount of effort can alter. The polarity ... depends upon a feeling

the ego to the outer world is passive in so far as it receives stimuli from it, active when it reacts to these. Its instincts compel it to a quite special degree of activity towards the outside world, so that, if we wished to emphasize the essence of the matter, we might say that the ego-subject is passive in respect of external stimuli, active in virtue of its own instincts. The antithesis of active—passive coalesces later with that of masculine—feminine, which, until this has taken place, has no psychological significance. The fusion of activity with masculinity and passivity with femininity confronts us indeed, as a biological fact, but it is by no means so invariably complete and exclusive as we are inclined to assume.

The three polarities within the mind are connected with one another in various highly significant ways. There is a certain primal psychic situation in which two of them coincide. Originally, at the very beginning of mental life, the ego's instincts are directed to itself and it is to some extent capable of deriving satisfaction for them on itself. This condition is known as *narcissism* and this potentiality for satisfaction is termed *auto-erotic*. The outside world is at this time, generally speaking, not cathected with any interest and is indifferent for purposes of satisfaction. At this period, therefore, the ego-subject coincides with what is pleasurable and the outside world with what is indifferent (or even painful, as being a source of stimulation). Let us for the moment define *loving* as the re-

Some of the sexual instincts are, as we know, capable of this auto-erotic satisfaction and so are adapted to be the channel for the development under the sway of the pleasure-principle which we shall describe later. The sexual instincts which from the outset require an object, and the needs of the ego-instincts which are never capable of auto-erotic satisfaction, of course ... this condition and ...

lation of the ego to its sources of pleasure, then the situation in which the ego loves itself only and is indifferent to the outside world illustrates the first of the polarities in which *loving* appeared.

In so far as it is auto-erotic, the ego has no need of the outside world, but in consequence of experiences undergone by the instincts of self-preservation, it tends to find objects there and doubtless it cannot but for a time perceive inner instinctual stimuli as painful. Under the sway of the pleasure-principle there now takes place a further development. The objects presenting themselves, in so far as they are sources of pleasure, are absorbed by the ego into itself, *introjected* (according to an expression coined by Ferenczi), while on the other hand, the ego thrusts forth upon the external world whatever within itself gives rise to pain (see below: the mechanism of projection).

Thus the original *reality-ego*, which distinguished outer and inner by means of a sound objective criterion, changes into a purified *pleasure-ego* which prizes above all else the quality of pleasure. For this pleasure-ego the outside world is divided into a part that is pleasurable, which it has incorporated into itself, and a remainder that is alien to it. A part of itself it has separated off, and this it projects into the external world and regards as hostile. According to this new arrangement the congruence of the two polarities

ego-subject with pleasure

outside world with pain (or earlier with neutrality) is once more established.

When the stage of primary narcissism is invaded by the object, the second contrary attitude to that of love, namely hate, attains to development.

As we have heard, the ego's objects are presented to it from the outside world in the first instance by the instincts of self-preservation, and it is undeniable also that hate originally betokens the relation of the ego to the alien external world with its afflux of stimuli. Neutrality may be classified as a special case of hate or rejection, after having made its appearance first as the forerunner of hate. Thus at the very beginning the external world, objects and that which was hated were one and the same thing. When later on an object manifests itself as a source of pleasure, it becomes loved, but also incorporated into the ego, so that for the purified pleasure-ego the object once again coincides with what is extraneous and hated.

Now however we note that just as the ...

tithesis love—indifference reflects the polarity ego—external world so the second antithesis love—hate reproduces the polarity pleasure—pain which is bound up with the former When the purely narcissistic stage gives place to the object stage pleasure and pain denote the relations of the ego to the object When the object becomes a source of pleasurable feelings a motor tendency is set up which strives to bring the object near to and incorporate it into the ego we then speak of the *attraction* exercised by the pleasure giving object and say that we *love* that object Conversely when the object is the source of painful feelings there is a tendency which endeavours to increase the distance between object and ego and to repeat in relation to the former the primordial attempt at flight from the external world with its flow of stimuli We feel a *repulsion* from the object and hate it this hate can then be intensified to the point of an aggressive tendency towards the object with the intention of destroying it

We might at a pinch say of an instinct that it loves the objects after which it strives for purposes of satisfaction but to say that it hates an object strikes us as odd so we become aware that the attitudes of love and hate can not be said to characterize the relations of instincts to their objects but are reserved for the relations of the ego as a whole to objects But if we consider a colloquial usage which is certainly full of meaning we see that there is yet another limitation to the significance of love and hate We do not say of those objects which serve the interests of self preservation that we love them rather we emphasize the fact that we need them and perhaps add an element of a different kind in our relation to them by words which denote a much lesser degree of love—for example *to be fond of to like to find agreeable*

So the word *love* becomes shifted ever further into the sphere of the pure pleasure relation existing between the ego and its object and finally attaches itself to sexual objects in the narrower sense and to those which satisfy the needs of sublimated sexual instincts The discrimination of the ego instincts from the sexual a discrimination which we have imposed upon our psychology is seen therefore to be in conformity with the spirit of our speech Since we do not customarily say that the single sexual component instinct loves its object but see the most appropriate case in which to apply the word *love* in the relation of the ego to its sexual object we learn from this fact that the applicability of the word in this relation begins only with the synthesis of all the component instincts under the primacy of the genitals and in the service of the function of reproduction

It is noteworthy that in the use of the word *hate* no such intimate relation to sexual pleasure and the sexual function appears on the contrary the painful character of the relation seems to be the sole decisive feature The ego hates abhors and pursues with intent to destroy all objects which are for it a source of painful feelings without taking into account whether they mean to it frustration of sexual satisfaction or of gratification of the needs of self preservation Indeed it may be asserted that the true prototypes of the hate relation are derived not from sexual life but from the struggle of the ego for self preservation and self maintenance

So we see that love and hate which present themselves to us as essentially antithetical, stand in no simple relation to each other They did not originate in a cleavage of any common primal element but sprang from different sources and underwent each its own development before the influence of the pleasure pain relation constituted them antitheses to each other At this point we are confronted with the task of putting together what we know of the genesis of love and hate

Love originates in the capacity of the ego to satisfy some of its instincts auto-erotically through the obtaining of *organ pleasure* It is primarily narcissistic is then transferred to those objects which have been incorporated in the ego now much extended and expresses the motor striving of the ego after these objects as sources of pleasure It is intimately connected with the activity of the later sexual instincts and when these have been completely synthetized coincides with the sexual trend as a whole. The preliminary stages of love reveal themselves as temporary sexual aims while the sexual instincts are passing through their complicated development First amongst these we recognize the phase of incorporating or devouring a type of love which is compatible with abolition of any separate existence on the part of the object and which may therefore be designated *ambivalent* At the higher stage of the pregenital sadistic anal organization the striving after the object appears in the form of an impulsion to mastery in which injury or annihilation of the object is a matter of indifference. This form and preliminary stage of love is hardly to be distinguished from hate in its be-

hav ur towards the bject. Only when the ge tal organizati n is established does l ve be

wo ld hence flows the stream of st m li. As an express on of the pain re ction ind ced by h

anal rganizati n, they impart the qualities of hate to the instinct s aim as well

The history of the rigin and relat ons of love makes us understand how it s that l ve so c nstantly man fe ts itself as amb valent accompanied by feelin s of hat agai st the same bj ct Th admixture of hate i love is to be t ac d in part t those p eliminary stages f love which ha e n t been holly o t grown a d in part is based upon react ons of avers on and rep diation on the part of the ego-instincts which, in the freq ent conflicts be tw e the inte ests of the ego and those of love can claim to be upported by real and ctual motives. In both cases therefore the admix ture of hate may be traced to the ource of self preservative instincts. When a love relat onsh p with a g en object is broken off it is not in frequently s cceeded by hate so that we re ce ve the imp ess on of a transformation of lo e into hate This descript ve characteriza tion is ampl fied by the view that when this happens the hate which s moti ated by con s derations of real ty is re nforced by a re gression f the love to the sadistic prel minary stage so that the hate acqu es an ero c char acter and the continuity of a love relation is e su ed

The third antithesis of lo e the transforma tio of loving into bein loved represents the peration of the polarity f active and pas ve and is to be judged in the same way as in scoptophilia a d sadism We may sum up by sayi g that the es ent al feature in the vicis situdes undergo e by i stincts is *thei s bjec tion to the nfl nces of th thr e g eat polari t s that govern m tal l fe* Of these th ee polarities we might describe that of act vity—passiv ty as th *b olog al* that of ego—exter nal world as the *r al* and finally that of pleas ure—pain as th *co om c* respecti ely

That possible viciss tud undergon by an instinct wh ch we call *p ession* will form the subject of a further inquiry

Repression[1]

One of the vicissitudes an instinctual impulse may undergo is to meet with resistances the aim of which is to make the impulse inoperative Under certain conditions which we shall presently investigate more closely the impulse then passes into the state of *repression* If it were a question of the operation of an external stimulus obviously flight would be the appropriate remedy with an instinct flight is of no avail for the ego cannot escape from itself Later on rejection based on judgment (*condemnation*) ...
against the
phase of
flight and
could not have been formulated before the time of psycho analytic research

It is not easy in theory to deduce the possibility of such a thing as repression Why should an instinctual impulse suffer such a fate? For this to happen obviously a necessary condition must be that attainment of its aim by the instinct should produce pain instead of pleasure But we cannot well imagine such a contingency There are no such instincts satisfaction of an instinct is always pleasurable We should have to assume certain peculiar circumstances some sort of process which changes the pleasure of atisfaction into pain

In order the better to define repression we may discuss some other situations in which instincts are concerned It may happen that an external stimulus becomes internal for example by eating into and destroying a bodily organ so that a new source of constant excitation and increase of tension is formed The stimulus thereby acquires a far reaching similarity to an instinct We know that a case of this sort is experienced by us as *physical pain* The aim of this pseudo instinct however is simply the cessation of the change in the organ and of the pain accompanying it There is no other direct pleasure to be attained by cessation of the pain Further pain is imperative the only things which can subdue it are the effect of some toxic agent in removing it and the influence of some mental distraction

The case of physical pain is too obscure to help us much in our purpose Let us suppose that an instinctual stimulus such as hunger remains unsatisfied It then becomes imperative and can be allayed by nothing but the appropriate action for satisfying it it keeps up a constant tension of need Anything like a repression seems in this case to be utterly out of the question

So repression is certainly not an essential result of the tension produced by lack of satisfaction of an impulse being raised to an unbearable degree The weapons of defence of which the organism avails itself to guard against that situation must be discussed in another connection

Let us instead confine ourselves to the clinical experience we meet with in the practice of psycho analysis We then see that the satisfaction of an instinct under repression is quite possible further that in every instance such a satisfaction is pleasurable in itself but is irreconcilable with other claims and purposes it therefore causes pleasure in one part of the mind and pain in another We ee then that it is a condition of repression that the element of avoiding pain shall have acquired more stren th than the pleasure of gratification Psycho analytic experience of the transference neuroses moreover forces us to the conclusion that repression is not a defence mechanism present from the very beginning and that i cannot occur until a sharp distinction has been established between what is conscious and what is unconscious that *the essence of repression lies simply in the function of rejecting and keeping something out of consciousness* This conception of repression would be supplemented by assuming that before the mental organization reaches this phase the other vicissitudes which may befall instincts e g reversal into the opposite or turning round upon the subject deal with the task of mastering the instinctual impulses

It seems to us now that in view of the very great extent to which repression and the unconscious are correlated we must defer probing more deeply into the nature of repression until we have learnt more about the structure of the various institutions in the mind—and about what differentiates consciousness from the un

beyond which it would break through for satisfaction Repression acts therefore in a *highly specific* manner in each instance every single derivative of the repressed may have its peculiar fate—a little more or a little less distortion alters the whole issue In this connection it becomes comprehensible that those objects to which men give their preference that is their ideals originate in the same perceptions and experiences as those objects of which they have most abhorrence and that the two originally differed from one another only by slight modifications Indeed as we found in the origin of the fetish it is possible for the original instinct presentation to be split into two one part undergoing repression while the remainder just on account of its intimate association with the other undergoes idealization

The same result as ensues from an increase or a decrease in the degree of distortion may also be achieved at the other end of the apparatus so to speak by a modification in the conditions producing *pleasure* and *pain* Special devices have been evolved with the object of bringing about such changes in the play of mental forces that what usually gives rise to pain may on this occasion result in pleasure and whenever such a device comes into operation the repression of an instinct presentation that is ordinarily repudiated is abrogated The only one of these devices which has till now been studied in any detail is that of joking Generally the lifting of the repression is only transitory the repression is immediately re established

Observations of this sort however suffice to draw our attention to some further characteristics of repression Not only is it as we have just explained *variable* and *specific* but it is also exceedingly *mobile* The process of repression is not to be regarded as something which takes place once for all the results of which are permanent as when some living thing has been killed and from that time onward is dead on the contrary repression demands a constant expenditure of energy and if this were discontinued the success of the repression would be jeopardized so that a fresh act of repression would be necessary We may imagine that what is repressed exercises a continuous straining in the direction of consciousness so that the balance has to be kept by means of a steady counter pressure A constant expenditure of energy therefore is entailed in maintaining a repression and economically its abrogation denotes a saving The mobility of the repression incidentally finds expression also in the mental characteristics of the condition of sleep which alone renders dream formation possible With a return to waking life the repressive cathexes which have been called in are once more put forth

Finally we must not forget that after all we have said very little about an instinctual impulse when we state it to be repressed Without prejudice to the repression such an impulse may find itself in widely different conditions it may be inactive i e cathected with only a low degree of mental energy or its degree of cathexis (and consequently its capacity for activity) may vary True its activity will not result in a direct abrogation of the repression but it will certainly set in motion all the processes which terminate in a breaking through into consciousness by circuitous routes With unrepressed derivatives of the unconscious the fate of a particular idea is often decided by the degree of its activity or cathexis It is an everyday occurrence that such a derivative can remain unrepressed so long as it represents only a small amount of energy although its content is of such a nature as to give rise to a conflict with conscious control But the quantitative factor is manifestly decisive for this conflict as soon as an idea which is fundamentally offensive exceeds a certain degree of strength the conflict takes on actuality and it is precisely activation of the idea that leads to its repression So that where repression is concerned an increase in energic cathexis operates in the same way as an approach to the unconscious while a decrease in that energy operates like distance from the unconscious or like distortion We understand that the repressing tendencies can find a substitute for repression in a weakening or lessening of whatever is distasteful to them

In our discussion hitherto we have dealt with the repression of an instinct presentation and by that we understood an idea or group of ideas which is cathected with a definite amount of the mental energy (libido interest) pertaining to an instinct Now clinical observation forces us further to dissect something that hitherto we have conceived of as a single entity for it shows us that beside the idea there is something else another presentation of the instinct to be considered and that this other element undergoes a repression which may be quite different *from that of the idea* We have adopted the term *charge of affect* for this other element in the mental presentation it represents that part

of the instinct which has become d tached from the idea, and finds proportionate expression, ac rding to it quantity in processes wh ch be come observable to percept n as affects From this point o in d scribing a case of repres n we m t follow up the fate of the idea which und rgoes repress on eparately from that of the instinctual en rgy attached to the idea

W h uld be glad enough t be able to gi e som general ac ount of the utcome of both of these nd when we ha e take o r bearings a little we hall actu lly be able to do so In gene al, ep ess o of the ideational presenta t o f an instinct can surely only have the ff ct of causing it to anish from conscious- ess f t h d p e o sly b en in c nsc ousness o of h ldıng t b ck f it s about to ente t Th d ff rence fter all is not important t am unts to much the sam thi as the diffe ence betw en o d ring an und sirable guest out of my drawing room or o t f my front hall d refus g to l t him cross my threshold nce I ha e recognized him The fate of the qua titative f ct in the instinct pre entation may be o e of thre as we see by a cursory survey of the bservati s m de through psy cho-analy is e the the i tinct is altog ther f d or

tually successful the latter will for the most part elude our study

We now wish to ga n some insight into the mechanism of the process of repres ion and e pec ally we want to know whether it has a single mechan sm only or more than one and whether pe haps each of the psycho eu oses may be di ti guished by a characterist c repres- s on mechanism pecul ar to it elf At the outset of this inquiry however we e counter compl cations. The mechan sm of a repress on be- c mes accessible to us only when we deduce t f om its final results If we confine our observations to the results of its effect n the ideational part of the i st nct prese tation we discove that as a rule repression creates a *subst tute formation* What then is the mech anism of uch a subst t te formation or must we di tinguish several mechanisms here also? Further we know that repress on leaves *symptoms* in its trai May we then regard sub t tute f rmat on and symptom formation as coi cident processes and if this is on the whole pos ble does the m chanism of substi t te format o coincide with that of repression? So f a we know at present it seems probable that the two are widely di erge t that it is not the repres o itself which produ es sub- stitute format ons and sympt ms but that these latt r const tute indicatio s of a *return of the pr ssed* and owe the r exist nce to q te other p ocesses It would lso seem advisable to exam e the mechanisms of sub- stitute- and symptom f rmat on bef re those of epress n

Obviously th re is no gr und here for spec ulat n t explore on the c trary the s l t on of the p obl m must be found by careful analysis of the results of repressi n ob ervable in th indi idual neuroses I must h wever suggest that we hould po tpo this task too until we hav formed reli bl co ceptions of th relatio of c nsci usness to the un nsci us Only in d r that the present discus on m y t be quit unfru tful I will ant pate by saying ( ) that th mechanism f repres n does not n f ct co c d with the mechani m mechani ms of s b t tute format on (2) that the a e many diff r nt me han sms of s b t tute formatio and (3) that the d ffere t mechanisms f repre s on ha e at least this e thing in omm *withdrawal of ene g c cathexis* (r of *l bido* f it is a questi n of s xu l instinct)

F rth onfinin myself t the three best known forms of psy h neu osis I will show

beyond which it would break through for satisfaction Repression acts therefore in a *highly specific* manner in each instance every single derivative of the repressed may have its peculiar fate—a little more or a little less distortion alters the whole issue In this connection it becomes comprehensible that those objects to which men give their preference that is their ideals originate in the same perceptions and experiences as those objects of which they have most abhorrence and that the two originally differed from one another only by slight modifications Indeed as we found in the origin of the fetish it is possible for the original instinct presentation to be split into two one part undergoing repression while the remainder just on account of its intimate association with the other undergoes idealization

The same result as ensues from an increase or a decrease in the degree of distortion may also be achieved at the other end of the apparatus so to speak by a modification in the conditions producing pleasure and pain Special devices have been evolved with the object of bringing about such changes in the play of mental forces that what usually gives rise to pain may on this occasion result in pleasure and whenever such a device comes into operation the repression of an instinct presentation that is ordinarily repudiated is abrogated The only one of these devices which has till now been studied in any detail is that of joking Generally the lifting of the repression is only transitory the repression is immediately re established

Observations of this sort however suffice to draw our attention to some further characteristics of repression Not only is it as we have just explained *variable* and *specific* but it is also exceedingly *mobile* The process of repression is not to be regarded as something which takes place once for all the results of which are permanent as when some living thing has been killed and from that time onward is dead on the contrary repression demands a constant expenditure of energy and if this were discontinued the success of the repression would be jeopardized so that a fresh act of repression would be necessary We may imagine that what is repressed exercises a continuous straining in the direction of consciousness so that the balance has to be kept by means of a steady counter pressure A constant expenditure of energy therefore is entailed in maintaining a repression and economically its abrogation denotes a saving The mobility of the repression incidentally finds expression also in the mental characteristics of the condition of sleep which alone renders dream formation possible With a return to waking life the repressive cathexes which have been called in are once more put forth

Finally we must not forget that after all we have said very little about an instinctual impulse when we state it to be repressed Without prejudice to the repression such an impulse may find itself in widely different conditions it may be inactive i e cathected with only a low degree of mental energy or its degree of cathexis (and consequently its capacity for activity) may vary True its activity will not result in a direct abrogation of the repression but it will certainly set in motion all the processes which terminate in a breaking through into consciousness by circuitous routes With unrepressed derivatives of the unconscious the fate of a particular idea is often decided by the degree of its activity or cathexis It is an everyday occurrence that such a derivative can remain unrepressed so long as it represents only a small amount of energy although its content is of such a nature as to give rise to a conflict with conscious control But the quantitative factor is manifestly decisive for this conflict as soon as an idea which is fundamentally offensive exceeds a certain degree of strength the conflict takes on actuality and it is precisely activation of the idea that leads to its repression So that where repression is concerned an increase in energic cathexis operates in the same way as an approach to the unconscious while a decrease in that energy operates like distance from the unconscious or like distortion We understand that the repressing tendencies can find a substitute for repression in a weakening or lessening of whatever is distasteful to them

In our discussion hitherto we have dealt with the repression of an instinct presentation and by that we understood an idea or group of ideas which is cathected with a definite amount of the mental energy (libido interest) pertaining to an instinct Now clinical observation forces us further to dissect something that hitherto we have conceived of as a single entity for it shows us that beside the idea there is something else another presentation of the instinct to be considered and that this other element undergoes a repression which may be quite different from that of the idea We have adopted the term *charge of affect* for this other element in the mental presentation it represents that part

of the instinct which has become detached from the idea, and finds proportionate expression, according to its quantity, in processes which become observable to perception as affects. From this point on, in describing a case of repression, we must follow up the fate of the idea which undergoes repression separately from that of the instinctual energy attached to the idea.

We should be glad enough to be able to give some general account of the outcome of both these, and when we have taken our bearings a little we shall actually be able to do so. In general, repression of the ideational presentation of an instinct can surely only have the effect of causing it to vanish from consciousness if it had previously been in consciousness, or of holding it back if it is about to enter it. The difference, after all, is not important; it amounts to much the same thing as the difference between ordering an undesirable guest out of my drawing-room or out of my front hall, and refusing to let him cross my threshold once I have recognized him.[1] The further fate of the quantitative factor in the instinct-presentation may be one of three, as we see by a cursory survey of the observations made through psycho-analysis: either the instinct is altogether suppressed, so that no trace of it is found, or it appears in the guise of an affect of a particular qualitative tone, or it is transformed into anxiety. With the two last possibilities we are obliged to focus our attention upon the *transformation into affects and especially into anxiety* of the mental energy belonging to the instincts, this being a new possible vicissitude undergone by an instinct.

We recall the fact that the motive and purpose of repression was simply the avoidance of 'pain'. It follows that the fate of the charge of affect belonging to the presentation is far more important than that of the ideational content of it and is decisive for the opinion we form of the process of repression. If a repression does not succeed in preventing feelings of 'pain' or anxiety from arising, we may say that it has failed, even though it may have achieved its aim as far as the ideational element is concerned. Naturally the case of unsuccessful repression will have more claim on our interest than that of repression which is eventually successful; the latter will, for the most part, elude our study.

We now wish to gain some insight into the mechanism of the process of repression, and especially we want to know whether it has a single mechanism only or more than one and whether perhaps each of the psychoneuroses may be distinguished by a characteristic repression-mechanism peculiar to itself. At the outset of this inquiry, however, we encounter complications. The mechanism of a repression becomes accessible to us only when we deduce it from its final results. If we confine our observations to the results of its effect on the ideational part of the instinct-presentation, we discover that as a rule repression creates a *substitute-formation*. What, then, is the mechanism of such a substitute-formation, or must we distinguish several mechanisms here also? Further, we know that repression leaves symptoms in its train. May we then regard substitute-formation and symptom-formation as coincident processes and, if this is on the whole possible, does the mechanism of substitute-formation coincide with that of repression? So far as we know at present, it seems probable that the two are widely divergent, that it is not the repression itself which produces substitute-formations and symptoms, but that these latter constitute indications of a *return of the repressed* and owe their existence to quite other processes. It would also seem advisable to examine the mechanisms of substitute- and symptom-formation before those of repression.

Obviously there is no ground here for speculation to explore: on the contrary, the solution of the problem must be found by careful analysis of the results of repression observable in the individual neuroses. I must, however, suggest that we should postpone this task, too, until we have formed reliable conceptions of the relation of consciousness to the unconscious. Only in order that the present discussion may not be quite unfruitful, I will anticipate by saying (1) that the mechanism of repression does not in fact coincide with the mechanism or mechanisms of substitute-formation, (2) that there are many different mechanisms of substitute-formation, and (3) that the different mechanisms of repression have at least this one thing in common: a withdrawal of energic cathexis (or of libido, if it is a question of sexual instincts).

Further, confining myself to the three best known forms of psychoneurosis, I will show

[1] This metaphor, applicable to the process of repression, may also be extended to include one of the characteristics of repression mentioned earlier. I need only add that I have to place a sentinel to keep constant guard over the door which I have forbidden this guest to pass, lest he should burst it open (see above).

by means of some examples how the conceptions here introduced find application to the study of repression From *anxiety hysteria* I will choose an instance which has been subjected to thorough analysis—that of an animal phobia The instinctual impulse subjected to repression here is a libidinal attitude towards the father coupled with dread of him After repression this impulse vanishes out of consciousness the father does not appear in consciousness as an object for the libido As a substitute for him we find in a corresponding situation some animal which is more or less suited to be an object of dread The substitute formation of the ideational element has established itself by way of a displacement along the line of a series of associated ideas which is determined in some particular way The quantitative element has not vanished but has been transformed into anxiety The result is a fear of a wolf instead of a claim for love from the father Of course the categories here employed are not enough to supply a complete explanation even of the simplest case of psychoneurosis there are always other points of view to be taken into account

Such a repression as that which takes place in an animal phobia must be described as radically unsuccessful All that it has done is to remove the idea and set another in its place it has not succeeded at all in its aim of avoiding pain On this account too the work of the neurosis far from ceasing proceeds into a *second movement* so to speak which is designed to attain its immediate and more important aim There follows an attempt at flight the formation of the *phobia proper*—a number of things have to be *avoided* in order to prevent an outbreak of anxiety A more particular investigation would enable us to understand the mechanism by which the phobia achieves its aim

We are led to quite another view of the process of repression when we consider the picture of a true *conversion hysteria* Here the salient point is that it is possible to bring about a total disappearance of the charge of affect The patient then displays towards his symptoms what Charcot called *la belle indifférence des hystériques* At other times this suppression is not so completely successful a part of the sensation of distress attaches to the symptoms themselves or it has proved impossible entirely to prevent outbreaks of anxiety and this in its turn sets the mechanism of phobia formation working The ideational content of the instinct presentation is completely withdrawn from consciousness as a substitute-formation—and concurrently as a symptom—we have an excessive innervation (in typical cases, a somatic innervation) sometimes of a sensory sometimes of a motor character either as an excitation or as an inhibition The area of over innervation proves on closer observation to belong to the repressed instinct presentation itself and as if by a process of *condensation*, to have absorbed the whole cathexis Of course, these remarks do not cover the whole mechanism of a conversion hysteria the element of *regression* especially which will be appraised in another connection has to be taken into account

In so far as it is rendered possible only by means of extensive substitute formations the repression which takes place in hysteria may be pronounced entirely unsuccessful with reference to mastering the charge of affect however which is the real task of repression it generally betokens a complete success Again in conversion hysteria the process of repression terminates with the formation of the symptom and does not as in anxiety hysteria need to proceed to a *second movement*—or strictly speaking an unlimited number of *movements*

A totally different aspect of repression is shown in the third affection to which we are referring for purposes of this comparison in the *obsessional neurosis* Here we are at first in doubt what it is that we have to regard as the repressed instinct presentation—a libidinal or a hostile trend This uncertainty arises because the obsessional neurosis rests on the premise of a regression by means of which a sadistic trend has been substituted for a tender one It is this hostile impulse against a loved person which has undergone repression The effect at an early phase of the work of repression is quite different from that produced later At first the repression is completely successful the ideational content is rejected and the affect made to disappear As a substitute formation there arises an alteration in the ego an increased sensitiveness of conscience which can hardly be called a symptom Substitute and symptom formation do not coincide here Here too we learn something about the mechanism of repression Repression as it invariably does has brought about a withdrawal of libido but for this purpose it has made use of a *reaction-formation* by intensifying an antithesis So here the substitute formation has the same mechanism as the repression and at bottom

coincides with it while yet chronologically as well as in its content it is distinct from the symptom-formation. It is very probable that the whole process is made possible by the ambivalent relation into which the sadistic impulse destined for repression has been introduced.

But the repression at first successful does not hold; in the further course of things its failure becomes increasingly obvious. The ambivalence which has allowed repression to come into being by means of reaction-formation also constitutes the point at which the repressed succeeds in breaking through again. The vanished affect is transformed, without any diminution, into dread of the community, pangs of conscience, or self-reproaches; the rejected idea is replaced by a *displacement-substitute*, often by displacement on to something utterly trivial or indifferent. For the most part there is an unmistakable tendency to complete re-establishment of the repressed idea. Failure in repression of the quantitative factor brings into play by means of various taboos and prohibitions the same mechanism of flight as we have seen at work in the formation of hysterical phobias. The rejection of the idea from consciousness is however obstinately maintained, because it ensures abstention from action, preclusion of the motor expression of an impulse. So the final form of the work of repression in the obsessional neurosis is a sterile and never-ending struggle.

The short series of comparisons which have been presented here may easily convince us that more comprehensive investigations are necessary before we can hope to understand thoroughly the processes connected with repression and the formation of neurotic symptoms. The extraordinary intricacy of all the factors to be taken into consideration leaves us only one way open by which to present them. We must select first one and then another point of view, [illegible]

fail to be obscurities where we touch upon material not previously dealt with, but we may hope that the final synthesis of them all will lead to a good understanding of the subject.

The Unconscious[1]

PSYCHO ANALYSIS has taught us that the essence of the process of repression lies not in abrogating or annihilating the ideational presentation of an instinct but in withholding it from becoming conscious We then say of the idea that it is in a state of *unconsciousness* of being not apprehended by the conscious mind and we can produce convincing proofs to show that unconsciously it can also produce effects even of a kind that finally penetrate to consciousness Everything that is repressed must remain unconscious but at the very outset let us state that the repressed does not comprise the whole unconscious The unconscious has the greater compass the repressed is a part of the unconscious

How are we to arrive at a knowledge of the unconscious? It is of course only as something conscious that we know anything of it after it has undergone transformation or translation into something conscious The possibility of such translation is a matter of everyday experience in psycho analytic work In order to achieve this it is necessary that the person analysed should overcome certain resistances the very same as those which at some earlier time placed the material in question under repression by rejecting it from consciousness

I *Justification for the Conception of the Unconscious*

In many quarters our justification is disputed for assuming the existence of an unconscious system in the mind and for employing such an assumption for purposes of scientific work To this we can reply that our assumption of the existence of the unconscious is *necessary* and *legitimate* and that we possess manifold *proofs* of the existence of the unconscious It is necessary because the data of consciousness are exceedingly defective both in healthy and in sick persons mental acts are often in process which can be explained only by presupposing other acts of which consciousness yields no evidence These include not only the parapraxes and dreams of healthy persons and everything designated a *mental symptom* or an *obsession* in the sick our most intimate daily experience introduces us to sudden ideas of the source of which we are ignorant and to results of mentation arrived at we know not how All these conscious acts remain disconnected and unintelligible if we are determined to hold fast to the claim that every single mental act performed within us must be consciously experienced on the other hand they fall into a demonstrable connection if we interpolate the unconscious acts that we infer A gain in meaning and connection however is a perfectly justifiable motive one which may well carry us beyond the limitations of direct experience When after this it appears that the assumption of the unconscious helps us to construct a highly successful practical method by which we are enabled to exert a useful influence upon the course of conscious processes this success will have won us an incontrovertible proof of the existence of that which we assumed We become obliged then to take up the position that it is both untenable and presumptuous to claim that whatever goes on in the mind must be known to consciousness

We can go further and in support of an unconscious mental state allege that only a small content is embraced by consciousness at any given moment so that the greater part of what we call *conscious knowledge* must in any case exist for very considerable periods of time in a condition of latency that is to say of unconsciousness of not being apprehended by the mind When all our latent memories are taken into consideration it becomes totally incomprehensible how the existence of the unconscious can be gainsaid We then encounter the objection that these latent recollections can no longer be described as *mental processes* but that they correspond to residues of somatic processes from which something mental can once more proceed The obvious answer to this should be that a latent memory is on the contrary indubitably a residuum of a mental process But it is more important to make clear to our own minds that this objection is based on the identification—not it is true explicitly stated but regarded as axiomatic—of conscious and mental This identification is either a *petitio*

[1] *C ll ct d P p* IV first p bl hed *Z i h ft* t l III (9 5) ep t d *S mml g* 4th S E g l ps f th t gu m l y g l bj ts t —TR

assumption and begs the question whether all that is mental is also necessarily conscious or else it is a matter of convention, of nomenclature. In this latter case it is of course no more open to refutation than any other convention. The only question that remains is whether it proves so useful that we must needs adopt it. To this we may reply that the conventional identification of the mental with the conscious is thoroughly unpractical. It breaks up all mental continuity, plunges us into the insoluble difficulties of psychophysical parallelism, is open to the reproach that without any manifest grounds it overestimates the part played by consciousness, and finally it forces us prematurely to retire from the territory of psychological research without being able to offer us any compensation elsewhere.

At any rate it is clear that the question—whether the latent states of mental life, whose existence is undeniable, are to be conceived of as unconscious mental states or as physical ones—threatens to resolve itself into a war of words. We shall, therefore be better advised to give prominence to what we know with certainty of the nature of these debatable states. Now as far as their physical characteristics are concerned, they are totally inaccessible to us: no physiological conception nor chemical process can give us any notion of their nature. On the other hand, we know for certain that they have abundant points of contact with conscious mental processes; on being submitted to a certain method of operation they may be transformed into or replaced by conscious processes and all the categories which we employ to describe conscious mental acts, such as ideas, purposes, resolutions, and so forth, can be applied to them. Indeed, of many of these latent states we have to assert that the only point in which they differ from states which are conscious is just in the lack of consciousness of them. So we shall not hesitate to treat them as objects of psychological research, and that in the most intimate connection with conscious mental acts.

The stubborn denial of a mental quality to latent mental processes may be accounted for by the circumstance that most of the phenomena in question have not been objects of study outside psycho-analysis. Anyone who is ignorant of the facts of pathology, who regards the blunders of normal persons as accidental, and who is content with the old saw that dreams are froth need only ignore a few more problems of the psychology of consciousness in order to dispense with the assumption of an unconscious mental activity. As it happens, hypnotic experiments, and especially post-hypnotic suggestion, had demonstrated tangibly even before the time of psycho-analysis the existence and mode of operation of the unconscious in the mind.

The assumption of an unconscious is, moreover, in a further respect a perfectly *legitimate* one, inasmuch as in postulating it we do not depart a single step from our customary and accepted mode of thinking. By the medium of consciousness each one of us becomes aware only of his own states of mind; that another man possesses consciousness is a conclusion drawn by analogy from the utterances and actions we perceive him to make, and it is drawn in order that this behaviour of his may become intelligible to us. (It would probably be psychologically more correct to put it thus: that without any special reflection we impute to everyone else our own constitution and therefore also our consciousness, and that this identification is a necessary condition of understanding in us.) This conclusion—or identification—was formerly extended by the ego to other human beings, to animals, plants, inanimate matter and to the world at large, and proved useful as long as the correspondence with the individual ego was overwhelmingly great; but it became more untrustworthy in proportion as the gulf between the ego and the non-ego widened. Today our judgement is already in doubt on the question of consciousness in animals; we refuse to admit it in plants, and we relegate to mysticism the assumption of its existence in inanimate matter. But even where the original tendency to identification has withstood criticism—that is, when the non-ego is our fellow-man—the assumption of a consciousness in him rests upon an inference and cannot share the direct certainty we have of our own consciousness.

Now psycho-analysis demands nothing more than that we should apply this method of inference to ourselves also—a proceeding to which, it is true, we are not constitutionally disposed. If we do this, we must say that all the acts and manifestations which I notice in *myself* and do not know how to link up with the rest of my mental life must be judged as if they belonged to someone else and are to be explained by the mental life ascribed to that person. Further, experience shows that we understand very well how to interpret in others (i.e., how to fit into their mental context) those

same acts which we refuse to acknowledge as mentally conditioned in ourselves Some special hindrance evidently deflects our investigations from ourselves and interferes with our obtaining true knowledge of our elves

Now this method of inference applied to oneself in spite of inner opposition does not lead to the discovery of an unconscious but leads logically to the assumption of another second consciousness which is united in my elf with the consciousness I know But at this point criticism may fairly make certain comments In the first place a consciousness of which its own possessor knows nothing is something very different from that of another person and it is questionable whether such a consciousness lacking as it does its most important characteristic is worthy of any further discussion at all Those who have contested the assumption of an unconscious system in the mind will not be content to accept in its place an unconscious consciousness Secondly analysis shows that the individual latent mental proces es inferred by us enjoy a high degree of independence as though each had no connection with another and knew nothing about any other We must be prepared it would appear to assume the existence not only of a second consciousness in us but of a third and fourth also perhaps of an infinite series of states of consciousness each and all unknown to us and to one another In the third place—and this is the most weighty argument of all—we have to take into account that analytic investigation reveals some of these latent processes as having characteristics and peculiarities which seem alien to us or even incredible and running directly counter to the well known attributes of consciousness This justifies us in modifying our inference about ourselves and saying that what is proved is not a second consciousness in us but the existence of certain mental operations lacking in the quality of consciousness We shall also moreover be right

t

o t v ew They may most accurately be described as cases of a splitting of the mental activities into two groups whereby a single consciousness takes up its position alternately with either the one or the other of these groups [illegible] ainst

In psycho analysis there is no choice for us but to declare mental processes to be in themselves unconscious and to compare the perception of them by consciousness with the perception of the outside world through the sense organs we even hope to extract some fresh knowled e from the comparison The psycho analytic assumption of unconscious mental activity appears to us on the one hand a further development of that primitive animism which caused our own consciousness to be reflected in all around us and on the other hand it seems to be an extension of the corrections begun by Kant in regard to our views on external perception Just as Kant warned us not to overlook the fact that our perception is subjectively conditioned and must not be regarded as identical with the phenomena perceived but never really discerned so psycho-analysis bids us not to set conscious perception in the place of the unconscious mental process which is its object The mental like the physical is not necessarily in reality just what it appears to us to be It is however satisfactory to find that the correction of inner perception does not present difficulties so great as that of outer perception—that the inner object is less hard to discern truly than is the outside world

II Different Significance of the Term Unconscious *the Topographical Aspect*

Before going any further let us note the important thou h inconvenient fact that unconsciousness is only one attribute of the mental and by no means suffices to describe its character There are mental acts of very varying values which yet have in common the character istic of being unconscious The unconscious comprises on the one hand processes which are merely latent temporarily unconscious but which differ in no other respect from conscious ones and on the other hand proces es such as those which have undergone repression which if they came into consciousness must stand out in the crudest contrast to the rest of the conscious mind It would put an end to all misunderstandings if from now on in describing the various kinds of mental acts we were to pay no attention to whether they were conscious or unconscious but when classifying and correlating them inquired only to which instincts and aims they were related how they were composed and to which of the systems in the mind that are superimposed one upon another they belonged This however is for various reasons impracticable and it follows that we cannot escape the imputation of ambiguity in that we use the words *conscious* and *unconscious* sometimes in a descriptive and sometimes in a systematic sense in which latter they

ig fy inclus.on in ome part cular system and posse on of certai characterist cs We might still attempt to a d o fus o by empl yi for the recognized mental s s em certai a b trarily chosen name which have no reference t consciousness. melled and may proceed according to its own requirements It will moreover be useful for us to remind ourselves that our hypotheses can in the first instance lay claim only to the value of illustrations The former of the two possibilities which we considered—namely that the conscious phase of an idea implies a fresh record of it which must be localized elsewhere—is doubtless the cruder but also the more convenient The second assumption—that of a merely functional change of state—is *a priori* more probable but it is less plastic less easy to handle With the first or topographical assumption is bound up that of a topographical separation of the systems *Cs* and *Ucs* and also the possibility that an idea may exist simultaneously in two parts of the mental apparatus—indeed that if it is not inhibited by the censorship it regularly advances from the one position to the other possibly without its first location or record being abandoned This may seem odd but it can be supported by observations from psycho analytic practise

If we communicate to a patient some idea which he has at one time repressed but which we have discovered in him our telling him makes at first no change in his mental condition Above all it does not remove the repression nor undo its effects as might perhaps be expected from the fact that the previously unconscious idea has now become conscious On the contrary all that we shall achieve at first will be a fresh rejection of the r[illegible]

[illegible] apparatus first he has the conscious memory of the auditory impression of the idea conveyed in what we told him and secondly and side by side with this he has—as we know for certain—the unconscious memory of his actual experience existing in him in its earlier form Now in reality there is no lifting of the repression until the conscious idea after overcoming the resistances has united with the unconscious memory trace Only through bringing the latter itself into consciousness is the effect achieved On superficial consideration this would seem to show that conscio[illegible]

[illegible] of the information given to the patient with his own repressed memory is only apparent To have listened to something and to have experienced something are psychologically two different things even though the content of each be the same.

So for the moment we are not able to decide between the two possibilities that we have discussed Perhaps later on we shall come upon certain factors which may turn the balance in favour of one or the other Perhaps we shall discover that our question as we formulated it was not sufficiently comprehensive and that the difference between a conscious and an unconscience idea has to be defined quite otherwise

III *Unconscious Emotions*

We limited the foregoing discussion to ideas and may now raise a new question the answer to which must contribute to the elucidation of our theoretical position We said that there were conscious and unconscious ideas but are there also unconscious instinctual impulses emotions and feelings or are such constructions in this instance devoid of any meaning?

I am indeed of opinion that the antithesis of conscious and unconscious does not hold for instincts An instinct can never be an object of consciousness—only the idea that represents the instinct Even in the unconscious moreover it can only be represented by the idea If the instinct did not attach itself to an idea or manifest itself as an affective state we could know nothing about it Though we do speak of an unconscious or a repressed instinctual impulse this is a looseness of phraseology which is quite harmless We can only mean an instinctual impulse the ideational presentation of which is unconscious for nothing else comes into consideration

We should expect the answer to the question about unconscious feelings emotions and affects to be just as easily given It is surely of the essence of an emotion that we should feel it i e that it should enter consciousness So for emotions feelings and affects to be unconscious would be quite out of the question B[illegible] in psycho analytic practise we are accustomed to speak of unconscious love hate anger etc and find it impossible to avoid even the strange conjunction *unconscious consciousness of guilt* or a paradoxical *unconscious anxiety* Is there more meaning in the use of these terms than there is in speaking of *unconscious instinct[illegible]*

The two cases are really not on all fours To begin with it may happen that an affect or an emotion is perceived but misconstrued By the repression of its proper presentation it is forced to become connected with another idea and is now interpreted by consciousness as the ex[illegible]

pres ion of this other idea. If we re tore the true connection we call the or ginal affect *un-conscious* although the affect was ne er u con conscious but its ideational p e entat on had under repre on In any e ent the use of h terms as *unconscio s affect and emotion* c nse e factor that an t v cis part as tati ely it s or it is tran f rmeu differe t charge of ffect abo e all into anxi y or t s suppressed i.e its development hind ed altogether (These poss bilities may erhaps be stud d even more easily in the neu chnique of the dream work than in the neu se) We know too that to uppress the development f affect is th true aim of repres on and that its wo k does not terminate if th aim is not achieved In every instance wh re repress on has succeeded in inhibit ng the development f an affect we apply the term *u conscious* t those aff cts that are restored when w undo the wo k of rep es n. So it cann t be den ed that th u e f the terms in q e t o is logical b t a comparison of the un cons us affe t w th the unc cious dea re veals the s gnificant diff rence that the unco

strictly speaki g with the mode f exp ession in question there re o unco scious aff ts in th sense in which th re are unc nsci us deas. But there may very well be n th system *Ucs* affect form t o s which, l k thers om int onsciousness. The wh l differe e arises f m the f ct that deas ar cathexes—ultimately f mem ry tra es—whil t aff ts and motio correspo d

It is f special interest t us to have estab l hed the f ct that repre ca su eed in inhib tin the tran format f nstin tual imp lse int aff ctiv xp ess Thi show us that the sy tem *Cs* n rmally c t ls ffectiv ty as well a ess t m t lity d thi en han es the mportance of rep o sin e t sh ws us that th latte i respons bl n t

merely when something is withheld from con sc ousness but also when affect ve development and the inaugurat on of mu cular acti y is prevented Con ersely too we may say that as long as the system *Cs* co trols activ ty and mot lity the mental cond t on of the person in question may be called *ormal* Nevertheless there is an unmistakable difference in the re-lation of the co trolling system to the two allied processes of discharge Wherea the control of the system *Cs* over vol ntary mo il ity is firmly rooted regularly w th tands the on laught of neurosis a d o ly breaks down in psychos s the control of the *Cs* over affecti e development is less firmly es abl hed. E en in normal l fe we can recogn e that a constant struggle for primacy over a ectivity goes on between the two systems *Cs* and *Pcs* that cer tain pheres of influence are marked off o e from an ther and that the forces at work tend to mingle

The importance of the system *Cs (Pcs)* for the a enues of affective and mot r d scharge enables us to understand also the r e which falls to subst tutive ideas in determ ing the form of a d ease It is possible for affective proceed d rectly from the sys-

has to wai

dea in the system *Cs* Affective development can then proceed from this conscious substi tute the nature of which d term nes the quali tative characte of the affect. We ha e asserted that und r repression a severance takes place between the aff ct and the idea to wh ch it bel ngs and that e ch then f lfils ts separate de tiny For purposes of description this i in cont o ertible in actual ty however the aff ct does not as a rule arise u til it has s cceeded in penetrat n int the *Cs* in attachment to ome ew s bst tut e idea

IV *T pography and Dynam cs of Repression*

So far we ha e gathered f m o r di cus o that repressio s essentially a process affect ing deas n the bord between the systems *Ucs* and *Pc (Cs)* and we ca now make a fresh attempt to descr be thi process m re m tely It must be a matter of withdrawal of cathexis but the question is in what sy tem

melled and may proceed according to its own requirements It will moreover be useful for us to remind ourselves that our hypotheses can in the first instance lay claim only to the value of illustrations The former of the two possibil ities which we considered—namely that the conscious phase of an idea implies a fresh rec ord of it which must be localized elsewhere—is doubtless the cruder but also the more con venient The second assumption—that of a merely functional change of state—is *a priori* more probable but it is less plastic le s easy to handle With the first or topographical as sumption is bound up that of a topographical separation of the systems *Cs* and *Ucs* and also the possibility that an idea may exist simulta neously in two parts of the mental apparatus—indeed that if it is not inhibited by the cen or ship it regularly advances from the one posi tion to the other possibly without its first location or record being abandoned This may seem odd but it can be supported by observa tions from psycho analytic practise

If we communicate to a patient some idea which he has at one time repressed but which we have discovered in him our telling him makes at first no change in his mental condi tion Above all it does not remove the repres sion nor undo its effects as might perhaps be expected from the fact that the previously un conscious idea has now become conscious On the contrary all that we shall achieve at first will be a fresh rejection of the repressed idea At this point however the patient has in actual fact the same idea in two forms in two separate localities in his mental apparatus first he has the conscious memory of the auditory impres sion of the idea conveyed in what we told him and secondly and side by side with this he has—as we know for certain—the unconscious memory of his actual experience existing in him in its earlier form Now in reality there is no lifting of the repression until the conscious idea after overcoming the resistances has united with the unconscious memory trace Only through bringing the latter itself into consciousness is the effect achieved On super ficial consideration this would seem to show that

shows that the identity of the information given to the patient with his own repressed memory is only apparent To have listened to omething and to have experienced something are psychologically two different things even thou h the content of each be the same.

So for the moment we are not able to de cide between the two possibilities that we have discussed Perhaps later on we shall come [illegible] certain factors which may turn the balance in favour of one or the other Perhaps we shall discover that our question as we formulated it was not sufficiently comprehensive and that the difference between a conscious and an un conscience idea has to be defined quite other wise

III *Unconscious Emotions*

We limited the foregoing discussion to ideas and may now raise a new question the answer to which must contribute to the elucidation of our theoretical po ition We said that there were conscious and unconscious ideas but are there also unconscious instinctual impulses, emotions and feelin s or are such construc tions in this instance devoid of any meaning?

I am indeed of opinion that the antithesis of conscious and unconscious does not hold for instincts An instinct can never be an object of consciousness—only the idea that represents the instinct Even in the unconscious more over it can only be represented by the idea If the instinct did not attach itself to an idea or manifest itself as an affective state we could know nothing about it Though we do speak of an unconscious or a repressed instinctual im pulse this is a looseness of phra eology which is quite harmless We can only mean an instinc tual impulse the ideational presentation of which is unconscious for nothing els comes into consideration

We should expect the answer to the question about unconscious feelings emotions and af fects to be just as easily given It is surely of the essence of an emotion that we should feel it i e that it should enter consciousness So for emotions feelings and affects to be uncon scious would be quite out of the que tion. But in psycho analytic practise we are accu tomed to speak of uncon cious love hate anger et and find it impossible to avoid even the strange conjunction *unconscious consciousness of guilt* or a paradoxical *unconscious anxiety* Is there more meaning in the use of these terms than there is in speaking of *unconscious instincts*

The two cases are really not on all fours To begin with it may happen that an affect or an emotion is perceived but misconstrued By the repression of its proper presentation it is forced to become connected with another idea and is now interpreted by consciousness as the ex

at which the anxiety-affect which is now all the more uncontrollable may break out and be discharged. Clinical observation shows, for instance, that when a child suffers from an animal-phobia he experiences anxiety under two kinds of conditions: in the first place when the repressed love-impulse becomes intensified, and, in the second, when the child perceives the animal it is afraid of. The substitutive idea acts in the one instance as a conductor from the system *Ucs* to the system *Cs*; in the other instance, as an independent source for the release of anxiety. The extending control on the part of the system *Cs* usually manifests itself by a tendency for the substitutive idea to be aroused more easily as time goes on in the second rather than the first way. Perhaps the child ends by behaving as though he had no liking at all for his father but had become quite free from him, and as though the fear of the animal were the real fear. Only that this fear of the animal, fed as such fear is from the sources of unconscious instinct, proves obdurate and extravagant in the face of all influences brought to bear from the system *Cs*, and thereby betrays its origin in the system *Ucs*.

In the second phase of anxiety hysteria, therefore, the anti-cathexis from the system *Cs* has led to substitute-formation. Soon the same mechanism is applied in a fresh direction. The process of repression, as we know, is not yet terminated, and finds a further aim in the task of inhibiting the outbreak of anxiety started by the substitute. This happens in the following manner: all the associations in the neighbourhood of the substitutive idea become endowed with a peculiar intensity of cathexis, so that they may display a high degree of sensibility to excitation. Excitation at any point of this protective structure must, on account of its connection with the substitutive idea, give rise to a slight degree of development of anxiety which is then used as a signal to inhibit, by means of a fresh flight on the part of the cathexis, any further development of anxiety. The further the sensitive and vigilant anti-cathexis becomes extended round the substitute which is feared, the more exactly can the mechanism function which is designed to isolate the substitutive idea and to protect it from fresh excitation. Naturally these precautions guard only against excitations approaching the substitutive idea from without through perception, never against instinctual excitation which encounters the substitutive idea from the direction of its connection with the repressed idea. So they begin to operate only when the substitute has successfully taken over representation of what has been repressed, and they can never operate with complete security. With each increase of instinctual excitation the protecting rampart round the substitutive idea must be shifted a little further outwards. The whole construction, which is produced in an analogous fashion in the other neuroses, is termed a *phobia*. The avoidances, renunciations, and prohibitions by which we recognize anxiety-hysteria are the manifestations of flight from conscious cathexis of the substitutive idea. Surveying the whole process we may say that the third phase has repeated and amplified the work of the second. The system *Cs* now protects itself by an anti-cathexis of its surrounding associations against the activation of the substitutive idea, just as previously the system secured itself by cathexis of the substitutive idea against the emergence of the repressed idea. Substitute-formation by the way of displacement has thus proceeded in its course. We may also add the system *C*

at w

brea

but ... the whole protective structure of the phobia corresponds to a salient of unconscious ... of this kind. Further we may lay stress on the interesting point of view that by the whole defence mechanism thus set in action a projection outwards of the menace from the instinct has been achieved. The ego behaves as if the danger of an outbreak of anxiety threatened it not from the direction of an instinct but from the direction of perception; this enables the ego to react against this external danger with the attempts at flight consisting of the avoidances characteristic of a phobia. In this process repression succeeds in one particular: the discharge of anxiety may be to some extent dammed up, but only at a heavy sacrifice of personal freedom. Attempts at flight from the claims of instinct are, however, in general useless, and the result of the flight by means of phobia remains still unsatisfactory.

A great deal of what we have recognized as true of anxiety hysteria holds good for the two other neuroses also, so that we can confine our discussion to the points of difference and the part played by the anti-cathexis. In conversion hysteria the instinctual cathexis of the repressed idea is transformed into the innervation necessary for the symptom. How far and in what circumstances the unconscious idea discharges

does the withdrawal take place and to which system does the cathexis withdrawn belong?

In the *Ucs* the repressed idea remains capable of action and must therefore have retained its cathexis So it must be something else which has been withdrawn Let us take the case of repression proper *(after expulsion)* as it affects an idea which is preconscious or even has already entered consciousness Repression can consist here only in the withdrawal from the idea of the (pre)conscious cathexis which belongs to the system *Pcs* The idea then remains without cathexis or receives cathexis from the *Ucs* or retains the unconscious cathexis which it previously had We have therefore withdrawal of the preconscious retention of the unconscious or substitution of an unconscious for a preconscious cathexis We notice moreover that we have unintentionally as it were based these reflections upon the assumption that the transition from the system *Ucs* to the system nearest to it is not effected through the making of a new record but through a change in its state an alteration in its cathexis The functional hypothesis has here easily routed the topographical

But this process of withdrawal of libido does not suffice to make comprehensible to us another characteristic of repression It is not clear why the idea which has retained its cathexis or has received cathexis from the *Ucs* should not in virtue of its cathexis renew the attempt to penetrate into the system *Pcs* The withdrawal of libido would then have to be repeated and the same performance would recur interminably but the result would not be repression In the same way the mechanism just discussed of withdrawal of preconscious cathexis would fail to explain the process of primal repression for here we have to consider an unconscious idea which as yet has received no cathexis from the *Pcs* and therefore cannot be deprived of it

What we are looking for therefore is another process which maintains the repression in the first case and in the second ensures its being established and continued and this other process we can only find in the assumption of an *anti cathexis* by means of which the system *Pcs* guards itself against the intrusion of the unconscious idea We shall see from clinical examples how such an anti cathexis established in the system *Pcs* manifests itself This it is which represents the continuous effort demanded by a primal repression but also guarantees its persistence The anti cathexis is the sole mechanism of primal repression in the case of repression proper (*after-expulsion*) there is in addition withdrawal of the preconscious cathexis It is quite possible that th cathexis withdrawn from the idea is the very one used for anti cathexis

We see how we have gradually been l[illegible]

[illegible] *economic* standpoint one from which we try to follow out th fate of given volumes of excitation and to achieve at least relatively some assessment of it It will be only right to give a special na e to the way of regarding thin s which is the final result of psycho analytic research. I propose that when we succeed in describ[illegible] a mental process [illegible] graph[illegible] *psych*[illegible] forehand that in the present state of our knowledge we shall succeed in this only a isolated points

Let us make a tentative effort to give a metapsychological description of the process of repression in the three transference neuroses which are familiar to us Here we may substitute for the term *cathexis* that of *libido* because as we know in this case it is the fa[illegible] of sexual impulses with which we are dealin[illegible]

In anxiety hysteria a preliminary phase of the process is frequently overlooked perhaps indeed is really omitted on careful observation however it can be clearly discerned It consists in anxiety appearin without the subject knowing what he is afraid of We must suppose tha there was present in the *Ucs* some love impulse which demanded to be translated into th system *Pcs* the preconscious cathexis however recoiled from it in the manner of an atte[illegible] at flight and the unconscious libidinal cathexis of the rejected idea was discharged in the form of anxiety Then at some repetition of th process a first step was taken in the direction of mastering this distressin development of anxiety The fugitive cathexis attached itself to a substitutive idea which on the one hand was connected by association with the rejected idea and on the other escaped repression by reason of its remoteness from that idea (displacement substitute) and which permitted of a rationali zation of the still uncontrollable outbreak o anxiety The substitutive idea now plays the part of an anti cathexis for the system *Cs (Pcs)* by securing that system against an emergence into consciousness of the repressed idea on the other hand it is or acts as if it were the po–

at which the anxiety-affect which is now all the more unc trollable may br ak out a d be discharged Clin cal observat on hows for in stan that wh n child suff rs from a a mal phobia he experiences anx t under two kinds f conditi n in the first place when the repressed lov mpulse bec me intensified and in the sec nd when the ch ld perceives the anim l t is afra d of The subst tut ve dea acts in the o e in tan e as a c nductor f om the sy tem *Ucs* t the system *Cs* in th other in stance as an indepe dent source fo the release f nxiety Th e t nd ng contr l o the part of the system *Cs* usually ma f ts itself by a t nd cy for the subst tutive idea to be roused mo easily s tim goes o in the seco d rather than the first way Perh ps the child ends by beha ng as though he had no l'ki g at all for his fathe but had become qu te free from h m and s tho gh the fear of the an mal were the real fe r Only that this fea of the an mal fed as such a fea s from the springs of consc us in t nct pro es bdurate and extra aga t in the f ce of all infl ences brought to bea from the system *Cs* and the by betrays its origin in the system *Ucs*

I th second phase of anxi ty hysteria th re fore th anti-cath xis f m the system *Cs* has led t sub titut f rmat n. Soo the same mechanism is pplied in fre h directi n. The process f repres as w know is ot yet term ted and fi d a f rth aim in the task of inhib ting the o tbre k of anxiety started by

So they begin to operate only when the sub ti tute has successfully taken over representation of what has been repressed and they can never operate w th compl te security With each in crease of i sti ctual e c t o the p tecting rampart ro nd the subs tuti idea must be shifted a l ttle further outwards. A great deal of what we have recognized as true of anxiety hysteria holds good fo the two other eu s also so that w can confine r di uss on to the point f d ffere ce and the part pl yed by the anti-cathexis I c ers hysteria the inst ct l cath f the r p ess d d a s transformed into the in rv t on ne es sary fo the ymptom How far d in what ci cumstances the unco c s dea di harges

its cathexis through this outlet towards inner vation so that it can relinquish its pressure towards the system *Cs*—these and similar ques tions had better be reserved for a special in vesti ation of hysteria In conversion hysteria the part played by the anti cathexis proceeding from the system *Cs (Pcs)* is clear and becomes manifest in the symptom formation It is the anti cathexis that decides upon what part of the instinct presentation the whole cathexis may be concentrated The part thus selected to form a symptom fulfils the condition of expressing the aim of the instinctual impulse no less than the defensive or punishing endeavour of the system *Cs* so it achieves hyper cathexis and is maintained from both directions like the sub stitutive idea in anxiety hysteria From this circumstance we may conclude without much more ado that the degree of expenditure in re pression put forth by the system *Cs* need not be commensurate with the energic cathexis of the symptom for the strength of the repression is measured by the anti-cathexis put forth and the symptom is supported not only by this anti cathexis but also by the instinctual cathexis from the system *Ucs* which is interwoven with it

With reference to the obsessional neurosis we need only add to the observations brou ht forward in the preceding paper that here the anti cathexis of the system *Cs* comes most no ticeably into the foreground It is this that brings about the first repression in the shape of a reaction form [illegible]
at [illegible]
ma [illegible]
wo [illegible] repression seems far less successful in anxiety hysteria and in the obsessional neurosis than in conversion hysteria it is because the anti cathexis is so prominent and all outlet is lacking

V *Special Characteristics of the System* Ucs

The differentiation we have drawn between the two systems within the mind receives fresh significance when we observe that processes in the one system *Ucs* show characteristics which are not again met with in the system immedi ately above it

The kernel of the system *Ucs* consists of in stinct presentations whose aim is to discharge their cathexis that is to say they are wish impulses These instinctual impulses are co ordinate with one another exist independently side by side and are exempt from mutual con tradiction When two wishes whose aims must appear to us incompatible become simultane ously active the two impulses do not detract one from the other or cancel each other but combine to form an intermediate aim a com promise

There is in this system no negation no dubiety no varying degree of certainty all this is only imported by the work of the cen sorship which exists between the *Ucs* and the *Pcs* Negation is at a higher level a substitute for repression In the *Ucs* there are only con tents more or less strongly cathected

Intensity of cathexis is mobile in a far greater degree in this than in the other systems By the process of displacement one idea may sur render to another the whole volume of its cathexis by that of condensation it may ap propriate the whole cathexis of several oth ideas I have proposed to regard these two processes as distinguishing marks of the so called *primary process* in the mind In the sys tem *Pcs* the *secondary process* holds sway where a primary process is allowed to take its cour e in connection with elements belon g to the system *Pcs* it appears comic and excites laughter

The processes of the system *Ucs* are time less i e they are not ordered temporally are not altered by the passage of time in fact bear no relation to time at all The time relation also is bound up with the work of the system *Cs*

The processes of the *Ucs* are just as little related to reality They are subject to the pleasure principle their fate depends only upon the degree of their strength and upon their con formity to regulation by pleasure and pain

Let us sum up *exemption from mutual con t adiction p imary process* (motility of ca thexis) *timelessness* and *substitution of psy chic for external reality*—these are the charac teristics which we may expect to find in proc esses belonging to the system *Ucs*

Unconscious processes can only be observed by us under the conditions of dreaming and of neurosis that is to say when the processes of the higher system *Pcs* revert to an earlier level by a certain process of degradation (regres sion) Independently they are unrecognizable indeed cannot exist for the system *Ucs* is at a very early stage overlaid by the system *Pcs* which has captured the means of access to con

Furth t devol es upo th system *Pc* to mak c mmunicati po sible between the dif f rent deatio al co tents o that they can in fl en e e othe t give them a relati to tim t set p the rsh p or censor hips and t establish the inst tut n of *te t g e al ty* and th reality-principle C nscious mem ry too seem to depe d wh lly o the *Pcs* and should be lea ly d tingui hed f m the mem ry-trace in which the xperien s of th *U s* bec me fixed t pr bably corresponds with th m king of a special re rd— conc pt on whi h we tried t empl y as explaining the relation of nscious to unconscious ideas but wh h we have already di carded. In this c n nect o also we shall find the means to put an end to our uncertainty regard ng the name m wh h at present we vague

what we have brou

apport oning the various mental act v t es to on or other of the two systems. We are de scribing the state of affairs as it appears in the adult human be ng in whom the system *Ucs* in the strict sense functions only as a stage preliminary to the h her organizat on The co tent and connections of this sys em as the individual develops, the s gnificance it possesses in the case of an mals—these are po nts on whi h no con lus on can be deduced from our descript on they must be investigated nde pendently M reover in the human being we *mu t be prepared to find poss bl pathological* conditi ns under which the two systems lter or even exchange both their content and their characterist cs.

VI C mmun cat on betwee the Two Systems

It would certainly be wrong to imagi e that the *Ucs* remains at rest while the wh le work of th m d is performed by the *Pcs* that th *Ucs* is som thing finished with a vest gial or gan a residuum from the process of evolution wrong also to a sume that communica on be tween the two systems is c nfined to the act of repression the *Pcs* casting everythi g wh ch dist rbs it into the abyss of the *Ucs* On the contrary the *Ucs* is l ving and capabl of d velopm nt and mainta ns a number of other rel t ons to the *Pcs* amongst them that of co-operat on T sum up we mu t say that the *Ucs* is co t ed into its so-called *derivatives* is ac cess ble to the infl ence of life perpetually acts upon the *Pcs* a d ev n is on its part capable of influen e by the latter system

St dy f the deri at es of the *U s* w ll altogethe disappo t ur expectatio s of a s h mat cally cle d vis on of the one mental system f m the other Th s circum ta ce will certai ly give rise t d sati faction with o r re ults and will probably be used to ca t doubts upo the alue of r way of d ti gu h g the two gr ups f ment l p oc sses Ou a swer is howeve that w ha e no other m but that f translati int theory the r lt f ob servat n, and w hall de y that th e is a y obl gati on us t ch e t our very first att mpt, a th ory that commends itself by its

simplicity in which all is plain sailing We defend its complexities so long as we find that they fit in with the results of observation and we do not abandon our expectation of being guided in the end by those very complexities to recognition of a state of affairs that is at once simple in itself and at the same time answers to all the complications of reality

Among st the derivatives of the unconscious instinctual impulses the character of which we have just described there are some which unite in themselves opposite features On the one hand they are highly organized exempt from self contradictoriness have made use of every acquisition of the system *Cs* and would hardly be distinguished by our ordinary judgment from the formations of that system On the other hand they are unconscious and are incapable of becoming conscious Thus they belong according to their qualities to the system *Pcs* but in actual fact to the *Ucs* Their origin remains decisive for the fate they will undergo We may compare them with those human half breeds who taken all round resemble white men but betray their coloured descent by some striking feature or other on account of which they are excluded from society and enjoy none of the privileges of white people Of such a nature are the *phantasy formations* of normal persons as well as of neurotics which we have recognized as preliminary phases in the formation both of dreams and of symptoms and which in spite of their high degree of organization remain repressed and therefore cannot become conscious They draw near to consciousness and remain undisturbed so long as they do not become strongly cathected but as soon as a certain degree of this is exceeded they are thrust back Substitute formations are similar more highly organized derivatives of the *Ucs* but these succeed in breaking through into consciousness thanks to some favourable relation as for example when they coincide with a preconscious anti cathexis

When on another occasion we examine more closely the way in which entry into consciousness is conditioned we shall be able to find a solution for some of the difficulties arising here At this point it seems a good plan to contrast with the foregoing points of view which take their rise in consideration of the *Ucs* one which presents itself from the direction of consciousness Consciousness regards the whole sum of mental processes as belonging to the realm of the preconscious A very great part of this preconscious material originates in the unconscious has the characteristics of derivatives of the unconscious and is subject to a censorship before it can pass into consciousness Another part of the *Pcs* can become conscious without any censorship Here we light upon a contradiction of an earlier assumption from the point of view of repression we were obliged to place the censorship which is decisive for consciousness between the systems *Ucs* and *Pcs* Now it becomes probable to us that there is a censorship between the *Pcs* and the *Cs* But we shall do well not to regard this complication as a difficulty but to assume that to every transition from one system to that immediately above it (that is every advance to a higher stage of mental organization) there corresponds a new censorship As a corollary we shall have it is true to discard the assumption of a continuous laying down of new records

The reason for all these difficulties is that consciousness the only characteristic of mental processes directly available to us is in no way suited to serve as a criterion for the erection of systems Apart from the circumstance that what belongs to consciousness is not always in consciousness but can also be temporarily latent observation has shown that much which shares the attributes of the system *Pcs* does not become conscious and further we shall find that the entry into consciousness is circumscribed by certain dispositions of attention Hence consciousness stands in no simple relation either to the different systems or to the process of repression The truth is that it is not only what is repressed that remains alien to consciousness but also some of the impulses which dominate our ego and which therefore form the strongest functional antithesis to what is repressed In proportion as we try to win our way to a metapsychological view of mental life, we must learn to emancipate ourselves from our sense of the importance of that symptom which consists in *being conscious*

So long as we still cling to this we see our generalizations regularly invaded by exceptions We see that derivatives of the *Pcs* enter consciousness as substitute formations and as symptoms generally after undergoing great distortion in contrast to the *Ucs* although often many characteristics inviting repression have been retained We find that many preconscious formations remain unconscious though to judge by their nature we should suppose that they might very well become conscious Probably in their case the stronger attraction of

the *Ucs* asserts itself. We are led to look for the more important difference not between the conscious and the preconscious but between the preconscious and the unconscious. On the border of the *Pcs* the censorship thrusts back the *Ucs*, but its derivatives can circumvent this censorship, achieve a high degree of organization, and in the *Pcs* reach a certain intensity of cathexis; when however this is exceeded and they try to force themselves into consciousness, they are recognized as derivatives of the *Ucs* and are repressed afresh at the new frontier by the censorship between the *Cs* and the *Pcs*. Thus the former censorship is exercised against the *Ucs* itself, and the latter against its preconscious derivatives. We might suppose that in the course of individual development the censorship had been advanced a step.

In psycho-analytic treatment the existence of the second censorship, located between the systems *Pcs* and *Cs*, is proved beyond question. We require the patient to produce freely derivatives of the *Ucs*; we pledge him to overcome the objections of the censorship against these preconscious formations becoming conscious and, by overthrowing this censorship, we open up the way to abrogating the repression accomplished by the earlier one. To this let us add that the existence of the censorship between the *Pcs* and the *Cs* teaches us that becoming conscious is no mere act of perception, but is probably also a *hyper-cathexis*, a further advance in the mental organization.

Let us turn our attention to the communications existing between the unconscious and the other systems, not so much with a view to establishing anything fresh, as in order to avoid omitting the most prominent features. At the roots of instinctual activity the systems communicate with one another in the freest possible way: some of the processes here set in motion pass through the *Ucs* as through a preparatory stage and reach the highest mental development in the *Cs*, whilst some are retained as the *Ucs*. But the *Ucs* is also affected by experiences originating in outer perception. Normally all the paths from perception to the *Ucs* remain open; only those leading out from the *Ucs* are barred by repression.

It is very remarkable that the *Ucs* of one human being can react upon that of another without the *Cs* being implicated at all. This deserves closer investigation, especially with a view to finding out whether preconscious activity can be excluded as a factor in bringing this about; but for purposes of description the fact is incontestable.

The content of the system *Pcs* (or *Cs*) is derived partly from the instinctual life (through the medium of the *Ucs*) and partly from perception. It is doubtful how far the processes of this system can exert a direct influence on the *Ucs*; examination of pathological cases often reveals an almost incredible independence and lack of susceptibility to influence on the part of the *Ucs*. A complete divergence of their tendencies, a total dissociation of the two systems, is a general characteristic of disease. Yet psycho-analytic treatment is based upon influence by the *Cs* on the *Ucs*, and shows at any rate that this, though laborious, is not impossible. The derivatives of the *Ucs* which act as intermediaries between the two systems open the way, as we have already said, towards accomplishing this. But we may well suppose that spontaneously effected alteration in the *Ucs* from the side of the *Cs* is a difficult and slow process.

Co-operation between a preconscious and an unconscious impulse, even when the latter is subject to very strong repression, may be established, if the situation permits of the unconscious impulse operating in harmony with one of the controlling tendencies. The repression is removed for the occasion, the repressed activity being admitted as a reinforcement of the one intended by the ego. In respect of this single constellation, the unconscious becomes ego-syntonic, falls into line with the ego, without any change taking place in the repression otherwise. The effect of the *Ucs* in this co-operation is unmistakable: the reinforced tendencies reveal themselves as in some sense different from the normal—they make possible achievements of special perfection, and they manifest a resistance in the face of opposition similar to that of obsessional symptoms.

The content of the *Ucs* may be compared with a primitive population in the mental kingdom. If inherited mental formations exist in the human being—something analogous to instinct in animals—these constitute the nucleus of the *Ucs*. Later there is added to them that which is discarded as useless during childhood development, and this need not differ in its nature from what is inherited. A sharp and final division between the content of the two systems, as a rule, takes place only at puberty.

VII. Recognition of the Unconscious

So long as we derive our ideas of the *Ucs* only from our knowledge of dream-life and the

transference neuroses all that we can predicate of that system is probably represented in the foregoing remarks It is certainly not much and at some points it gives an impression of obscurity and confusion especially do we look in vain for the possibility of bringing the *Ucs* into any connection or classifying it under any heading with which we are already familiar Analysis of one of those affections called *nar cissistic psychoneuroses* alone promises to fur nish us with conceptions through which the enigmatic *Ucs* will be brought within our reach in a tangible fashion

Since the publication of a work by Abraham (1908)—attributed by its conscientious author to my instigation—we have been trying to de fine Kraepelin s *dementia praecox* (Bleuler s schizophrenia) on the basis of its relation to that pair of opposites consisting of the ego and its object In the transference neuroses (anxi ety and conversion hysteria and the obses sional neurosis) there was nothing to give special prominence to these opposites We knew indeed that frustration from the side of the object occasioned the outbreak of neurosis and that neurosis involved abandonment of the real object also that the libido withdrawn from the real object reverted first to an object in phantasy and then to one that had been repressed (introversion) But object cathexis in general is in such cases retained with great energy and more minute examination of the processes of repression has forced us to as sume that object cathexis persi ts in the sys tem *Ucs* in spite of—or rather in consequence of—the repression Indeed the capacity for transference of which we make use for thera peutic purposes in these affections presupposes unimpaired object cathexis

In schizophrenia on the other hand we have been obliged to assume that after the process of repression the withdrawn libido does not seek a new object but retreats into the ego that is to say that here the object cathexes are given up and a primitive objectless condition of narcissism is re established The incapacity of these patients for transference—so far as the process of disease extends—their consequent inaccessibility to therapeutic efforts the re pudiation of the outer world characteristic of them the manifestations of hyper cathexis of their ego the final outcome in complete apa thy—all these clinical features seem to accord excellently with the assumption that object cathexes are relinquished As re ards the re lation of the two psychical systems to each other all observers have been struck by the fact that in schizophrenia a great deal is con sciously expressed which in the transference neuroses can be demonstrated to exist in the *Ucs* only by means of psycho analysis But at the beginning we were not able to establish any intelligible connection between the ego-object relation and the relationships of consciousness.

In the following unexpected way we seem to arrive at what we are seeking In schizophre[illegible] we observe—especially in the earlier [illegible] which are so instructive—a number of changes in *speech* some of which deserve to be re garded from a particular point of view The patient often devotes peculiar care to his way [illegible] precious [illegible] of the sen[illegible] [illegible]rganization, making them so incomprehensible to us that the patient s remarks seem nonsen ical Often some relation to bodily organs or innervations is prominent in the content of these utterances. This may be correlated with another observa tion namely that in such symptoms of schizo phrenia as are comparable with the substitute formations of hysteria or the obsessional neurosis the relation between the substit[illegible] and the repressed material nevertheless di[illegible] plays peculiarities which would surprise us in these two forms of neurosis

Dr Viktor Tausk of Vienna has placed at my disposal some observations that he has made in the initial stages of schizophrenia which are particularly valuable in that the patient herself was anxious to explain her utterances further I will take two of his examples to il lustrate the thesis I wish to defend and I ha[illegible] no doubt that every observer could easily pro duce plenty of such material

One of Tausk s patients a girl who was brought to the clinic after a quarrel with her lover complained that *her eyes were not right they were twisted* This she herself explained by uttering in properly constructed sentences a series of reproaches against her lover She could not understand him at all he looked dif ferent every time he was a shammer an eye-twister he had twisted her eyes now they were not her eyes any more now she saw the world with different eyes

The patient s remarks about her first [illegible] comprehensible utterance have the value of an analysis for they contain the equivalent of the original words expressed in a generally com

A[illegible] g[illegible] erd[illegible] h[illegible] used i[illegible] Germa[illegible] t[illegible] mea[illegible] a[illegible] d[illegible] er —TR

prehensible form at the same time they explain the meaning and the genesis of speech formation in schizophrenia. In agreement with Tausk, I would here lay stress on the point that the relation to the bodily organ (the eye) has usurped the place of the whole content of the thought. The schizophrenic speech displays a hypochondriac trait: it has become *organ-speech*.

A second remark of the same patient runs: She was standing in church, suddenly she felt a jerk, she had to *change her position*, as though somebody put her into a position, as though she were *placed in a certain position*.

There follows the analysis by means of a fresh series of reproaches against her lover: he was common, he had made her common, too, though she was naturally refined. He had made her like himself by leading her to think that he was superior to her; now he had become like him, because she thought she would be better if she were like him. He had given a *false impression of his own position*; now she was just like him (identification) he had *changed her position*.[1]

The movement by which she *changed her position*, Tausk remarks, stood for the idea of *misrepresenting her position* and for the identification with the lover. Again I would call attention to the manner in which the whole train of thought is dominated by that element which has for its content a bodily innervation (or rather the sensation of it). An hysteric would, in the first case, have convulsively rolled her eyes and, in the second, have given actual jerks, instead of having the impulse to jerk or the sensation of being jerked; and in neither case would this have been accompanied by any conscious thoughts, nor would she afterwards have been able to express any such thoughts.

So far these two observations illustrate what we have called hypochondriac language or *organ-speech*. But they also point to something which seems to us more important, namely to another state of things of which we have innumerable instances (for example in the cases quoted in Bleuler's monograph) and which may be reduced to a definite formula. In schizophrenia *words* are subject to the same process as that which makes dream-images out of dream-thoughts—the one we have called the primary mental process. They undergo condensation, and, by means of displacement, transfer their cathexes to one another wholly or partly; the process may extend so far that a single word which on account of its manifold relations is especially suitable can come to represent a whole train of thought. The works of Bleuler, Jung, and their pupils have yielded abundant material precisely in support of this very proposition.[2]

[Illegible line]

schizophrenia and in hysteria and the obsessional neurosis—nice distinctions it is true yet producing a very strange effect. A patient whom I have at present under observation has let himself withdraw from all the interests of life on account of the unhealthy condition of the skin of his face. He declares that he has blackheads and that there are deep holes in his face which everyone notices. Analysis shows that he is working out his castration complex upon his skin. At first he busied himself with these blackheads without any misgivings, and it gave him great pleasure to squeeze them out, because, as he said, something spurted out when he did so. Then he began to think that there was a deep cavity wherever he had got rid of a blackhead and he reproached himself most vehemently with having ruined his skin for ever by constantly fiddling at it with his hand. Pressing out the content of the blackheads is clearly to him a substitute for onanism. The cavity which then appears in consequence of his guilty act is the female genital, i.e. stands for the fulfilment of the threat of castration (or the phantasy representing it) called forth by onanism. This substitute-formation has, in spite of its hypochondriacal character, considerable resemblance to an hysterical conversion; and yet we have the feeling that there must be something different in it, that we cannot believe such a substitute-formation possible in a case of hysteria, even before we can say in what the difference consists. A tiny little hole such as a pore of the skin will hardly be used by an hysteric as a symbol for the vagina, which otherwise he will compare with every imaginable object capable of enclosing a space. Besides, we should think that the multiplicity of these little cavities would prevent him from using them as a substitute for the female genital. The same applies to the case of a young patient re-

[1] Sich verstellen = to dissemble, disguise oneself.—Tr. Verstellen = to change the place of. As with *d. gestellt*, here again play on words: the concrete meaning of the word retaining its metaphorical sense.—Tr.

[2] The dream-work, too, occasionally treats words like things and then creates very similar schizophrenic utterances or neologisms.

ported by Tausk some years ago to the Vienna Psycho Analytical Society This patient behaved in other respects exactly as though suffering from an obsessional neurosis he took hours to dress and so on The striking feature of the case however was that he was able to tell the meaning of his inhibitions without any resistance For example in pulling on his stockings he was disturbed by the idea that he must draw apart the knitted stitches i e the holes and every hole was for him a symbol of the female genital aperture This again is a thing with which we cannot credit a patient suffering from obsessional neurosis a patient of this kind observed by R Reitler (one who suffered from the same lingering over putting on his stockings) after overcoming the resistances found the explanation that his foot symbolised the penis putting on the stocking stood for an onanistic act and that he had constantly to pull the stocking off and on partly in order to complete the representation of onanism and partly in order to undo the act

If we ask ourselves what it is that gives the character of strangeness to the substitute formation and the symptom in schizophrenia we come at last to understand that it is the predominance of the word relation over that of the thing There is only a very slight similarity between the squeezin out of a blackhead and an ejaculation from the penis still less similarity between the countless little pores of the skin and the vagina but in the former case there *is* in both instances a spurting out while in the latter the cynical saying a hole is a hole is *literally* true The identity of the two when expressed in *wo ds* not the resemblance of the objects desi nated has dictated the substitution Where the two—word and thing—do not coincide the substitute formation in schizophrenia deviates from that in the transference neuroses

Let us bring these considerations into connection with the conclusion that in schizophrenia the object cathexes are relinquished We must then modify this assumption and say The cathexis of the ideas of the words corresponding to the objects is retained What we could permissibly call the *conscious dea* of the object can now be split up into the *idea of the word* (verbal idea) and the *idea of the thing* (concrete idea) the latter consists in the cathexis if not of the direct memory images of the thing at least of remoter memory traces derived from these It strikes us all at once that now we know what is the difference between a conscious and an unconscious idea The two are not as we supposed different records of the same content situated in different parts of the mind nor yet different functional states of cathexis in the same part but the con cious idea comprises the concrete idea plus the verbal idea corresponding to it whilst the unconscious idea is that of the thin alone The system *Ucs* contains the thing cathexes of the objects the first and true object cathexes the system *Pcs* originates in a hyper cathexis of this concrete idea by a linking up of it with the verbal ideas of the words corresponding to it. It is such hyper cathexes we may suppo e that brin about higher organization in the mind and make it possible for the primary process to be succeeded by the secondary process which dominates *Pcs* Now too we are in a pos tion to state precisely what it is that repression denies to the rejected idea in the transference neuroses—namely translation of the idea into words which are to remain attached to the object The idea which is not put into words, or the mental act which has not received hyper cathexis then remains in the uncon cious in a state of repression

I may call attention to the fact that already very early we possessed the insight which today enables us to understand one of the most striking characteristics of schizophrenia The last pages of *The Interpretation of Dre s* published in 1900 expound the thesis that thou ht processes i e those cathected mental acts which are more remote from perception, are in themselves devoid of quality and are unconscious deriving their capacity to enter consciousness only from association with the residues of word perceptions The verbal ideas, for their part are derived from sense perceptions in the same way as concrete ideas are so that the question might be raised why ideas of objects cannot become conscious through the agency of their own residues of perceptions. But possibly thought proceeds in systems that are so far remote from the original residues of perception that they have no longer retained anything of the qualities of these residues so that in order to become conscious the content of the th h forced by wor with whi representing as they do only relations between the ideas of objects no quality co ld accrue from the perceptions them elves Such relations comprehensible only through words, form one of the most important parts of our

thought-processes. We understand that linking them up with verbal ideas is still no identical with their actually becoming conscious but only with the potentiality of this; it is therefore characteristic of the system *Pcs* and of that only. Now however we note that with these discussions we have departed from our real theme and find ourselves in the midst of problems concerning the preconscious and the conscious which for good reasons we are reserving for separate treatment.

In considering schizophrenia, which, to be sure we shall touch on here so far as seems indispensable for general knowledge of the *Ucs* the doubt must occur to us whether the process here termed *repression* has anything at all in common with the repression which takes place in the transference neuroses. The formula that repression is a process which occurs between the systems *Ucs* and *Pcs* (or *Cs*) and results in withholding the repressed material from consciousness must in any event be modified, in order to embrace the case of dementia praecox and other narcissistic affections. But the ego's attempt at flight expressing itself in withdrawal of conscious cathexis nevertheless remains a common factor. The most superficial reflection shows us how much more radically and thoroughly this attempt at flight, this flight of the ego, is carried out in the narcissistic neuroses.

If in schizophrenia, this flight consists in withdrawal of instinctual cathexis from those points which represent the unconscious idea of the object, it may seem strange that that part of the same idea which belongs to the system *Pcs*—the verbal ideas corresponding to it—should, on the contrary undergo a more intense cathexis. We might rather expect that the verbal idea, being the preconscious part would have to sustain the first impact of the repression, and that it would be wholly insusceptible of cathexis after the repression had proceeded as far as the unconscious concrete ideas. This is certainly difficult to understand. The solution suggests itself that the cathexis of the verbal idea is not part of the act of repression but represents the first of the attempts at recovery or cure which so conspicuously dominate the clinical picture of schizophrenia. These endeavours are directed towards regaining the lost objects and it may well be that to achieve this purpose the path to the object must be by way of the word belonging to it: they then have however to content themselves with words in the place of things. Our mental activity moves generally speaking, in one of two opposite directions: either it starts from the instincts and passes through the system *Ucs* to conscious mentation, or on excitation from without it passes through the systems *Cs* and *Pcs* till it reaches the unconscious cathexes of the ego and its objects. The second way must in spite of the repression which has taken place have remained clear and for some distance there is no hindrance to block the endeavours of the neurosis to regain its objects. When we think in abstractions, there is a danger that we may neglect the relations of words to unconscious concrete ideas and it must be confessed that the expression and content of our philosophizing begins to acquire an unwelcome resemblance to the schizophrenic's way of thinking. We may on the other hand attempt a characterization of the schizophrenic's mode of thought by saying that he treats concrete things as though they were abstract.

If we have really recognized the nature of the *Ucs* and have correctly defined the difference between an unconscious and a preconscious idea then researches starting from many other points may be expected to bring us back to the same conclusions.

A General Introduction to Psycho-Analysis

A General Introduction to Psycho-Analysis

PART I

FIRST LECTURE

INTRODUCTION

I do not know what knowledge any of you may already have of psycho-analysis, either from reading or from hearsay. But having regard to the title of my lectures—*Introductory Lectures on Psycho-Analysis*—I am bound to proceed as though you knew nothing of the subject and needed instruction, even in its first elements.

One thing at least I may pre-suppose that you know—namely, that psycho-analysis is a method of medical treatment for those suffering from nervous disorders; and I can give you an illustration of the way in which psycho-analytic procedure differs from and often reverses what is customary in other branches of medicine. Usually, when we introduce a patient to a new form of treatment we minimize its difficulties and give him confident assurances of its success. This is, in my opinion, perfectly justifiable, for we thereby increase the probability of success. But when we undertake to treat a neurotic psycho-analytically we proceed *otherwise*. We explain to him the difficulties of the method, its long duration, the trials and sacrifices which will be required of him; and, as to the result, we tell him that we can make no definite promises, that success depends upon his endeavours, upon his understanding, his adaptability and his perseverance. We have, of course, good reasons, into which you will perhaps gain some insight later on, for adopting this apparently perverse attitude.

Now I hope you will not be offended if I begin by treating you in the same way as I do my neurotic patients, for I shall positively advise you not to come to hear me a second time. And with this intention I shall explain to you how of necessity you can obtain from me only an incomplete knowledge of psycho-analysis and also what difficulties stand in the way of your forming an independent judgment on the subject. For I shall show you how the whole trend of your training and your accustomed modes of thought must inevitably have made you hostile to psycho-analysis, and also how much you would have to overcome in your own minds in order to master this instinctive opposition. I naturally cannot foretell what degree of understanding of psycho-analysis you may gain from my lectures, but I can at least assure you that by attending them you will not have learnt how to conduct a psycho-analytic investigation nor how to carry out a psycho-analytic treatment. And further, if any one of you should feel dissatisfied with a merely cursory acquaintance with psycho-analysis and should wish to form a permanent connection with it, I shall not merely discourage him, but I shall actually warn him against it. For as things are at the present time not only would the choice of such a career put an end to all chances of academic success, but, upon taking up work as a practitioner, such a man would find himself in a community which misunderstood his aims and intentions, regarded him with suspicion and hostility, and let loose upon him all the latent evil impulses harboured within it. Perhaps you can infer from the accompaniments of the war now raging in Europe what a countless host that is to reckon with.

However, there are always some people to whom the possibility of a new addition to knowledge will prove an attraction strong enough to survive all such inconveniences. If there are any such among you who will appear at my second lecture in spite of my words of warning they will be welcome. But all of you have a right to know what these inherent difficulties of psycho-analysis are to which I have alluded.

First of all, there is the problem of the teach-

NOTE: A series of lectures delivered at the Vienna Psychiatric Clinic, the first fifteen in [illegible], the last thirteen in [illegible]. First published in German in [illegible]; edition here used translated by Joan Riviere for the second English edition published in London in [illegible]. (First English edition had appeared in [illegible].)

And then you would find that not everything reported of Alexander is worthy of belief or sufficiently authenticated in detail; but I can hardly suppose that you would leave the lecture room in doubt altogether as to the reality of Alexander the Great. Your conclusions would be principally determined by two considerations: first, that the lecturer could have no conceivable motive for attempting to persuade you of something which he did not himself believe to be true, and secondly, that all the available authorities agree more or less in their accounts of the fact. In questioning the accuracy of the early writers you would apply these tests again, the possible motives of the authors and the agreement to be found between them. The result of such tests would certainly be convincing in the case of Alexander, probably less so in regard to figures like Moses and Nimrod. Later on you will perceive clearly enough what doubts can be raised against the credibility of an exponent of psycho-analysis.

Now you will have a right to ask the question: If no objective evidence of psycho-analysis exists and no possibility of demonstrating the process, how is it possible to study it at all or to convince oneself of its truth? The study of it is indeed not an easy matter, nor are there many people who have thoroughly learned it; still there is, of course, some way of learning it. Psycho-analysis is learnt first of all on oneself, through the study of one's own personality. This is not exactly what is meant by *introspection*, but it may be so described for want of a better word. There is a whole series of very common and well-known mental phenomena which can be taken as *material for self-analysis* when one has acquired some knowledge of the method. In this way one may obtain the required conviction of the reality of the processes which psycho-analysis describes and of the truth of its conceptions, although progress on these lines is not without its limitations. One gets much further by submitting oneself to analysis by a skilled analyst, undergoing the working of the analysis in one's own person and using the opportunity to observe the finer details of the technique which the analyst employs. This, eminently the best way, is of course only practicable for individuals and cannot be used in a class of students.

The second difficulty you will find in connection with psycho-analysis is not inherent in it, but is one for which I must hold you yourselves responsible, at least in so far as your medical studies have influenced you. Your training will have induced in you an attitude of mind very far removed from the psycho-analytical one. You have been trained to establish the functions and disturbances of the organism on an anatomical basis, to explain them in terms of chemistry and physics, and to regard them from a biological point of view; but no part of your interest has ever been directed to the mental aspects of life, in which, after all, the development of the marvellously complicated organism culminates. For this reason a psychological attitude of mind is still foreign to you, and you are accustomed to regard it with suspicion, to deny it a scientific status, and to leave it to the general public, poets, mystics, and philosophers. Now this limitation in you is undoubtedly detrimental to your medical efficiency, for on meeting a patient it is the mental aspects with which one first comes into contact, as in most human relationships, and I am afraid you will pay the penalty of having to yield a part of the curative influence at which you aim to the quacks, mystics, and faith-healers whom you despise.

I quite acknowledge that there is an excuse for this defect in your previous training. There is no auxiliary philosophical science that might be of service to you in your profession. Neither speculative philosophy nor descriptive psychology, nor even the so-called experimental psychology which is studied in connection with the physiology of the sense-organs, as they are taught in the schools, can tell you anything useful of the relation existing between mind and body or can give you a key to comprehension of a possible disorder of the mental functions. It is true that the psychiatric branch of medicine occupies itself with describing the different forms of recognizable mental disturbances and grouping them in clinical pictures, but in their best moments psychiatrists themselves are doubtful whether their purely descriptive formulations deserve to be called science. The origin, mechanism, and interrelation of the symptoms which make up these clinical pictures are undiscovered: either they cannot be correlated with any demonstrable changes in the brain, or only with such changes as in no way explain them. These mental disturbances are open to therapeutic influence only when they can be identified as secondary effects of some organic disease.

This is the lacuna which psycho-analysis is striving to fill. It hopes to provide psychiatry with the missing psychological foundation, to discover the common ground on which corre-

ing and exposition of the subject In your medical studies you have been accustomed to use your eyes You see the anatomical specimen the precipitate of the chemical reaction the contraction of the muscle as the result of the stimulation of its nerves Later you come into contact with the patients you learn the symptoms of disease by the evidence of your senses the results of pathological processes can be demonstrated to you and in many cases even the exciting cause of them in an isolated form On the surgical side you are witnesses of the measures by which the patient is help [illegible]

[illegible]

[illegible] peech and behaviour yields a series of observations which leave a deep impression on your minds Thus a teacher of medicine acts for the most part as an exponent and guide leading you as it were through a museum while you gain in this way a direct relationship to what is displayed to you and believe yourselves to have been convinced by your own experience of the existence of the new facts

But in psycho analysis unfortunately all this is different In psycho analytic treatment nothing happens but an exchange of words between the patient and the physician The patient talks tells of his past experiences and present impressions complains and expresses his wishes and his emotions The physician listens attempts to direct the patient s thought processes reminds him forces his attention in certain directions gives him explanations and observes the reactions of understanding or denial thus evoked The patient s unenlightened relatives—people of a kind to be impressed only by something visible and tangible preferably by the sort of *action* that may be seen at a cinema—never omit to express their doubts of how mere talk can possibly cure anybody Their reasoning is of course as illogical as it is inconsistent For they are the same people who are always convinced that the sufferings of neurotics are purely in their own imagination Words and magic were in the beginning one and the same thing and even today words retain much of their magical power By words one of us can give to another the greatest happiness or bring about utter despair by words the teacher imparts his knowledge to the student by words the orator sweeps his audience with him and determines its judgments and decisions Words call forth emotions and are universally the means by which we influence our fellow creatures Therefore let us not despise the use of words in [illegible]
tent if
between

But even that is impossible The dialogue which constitutes the analysis will admit of no audience the process cannot be demonstrated One could of course exhibit a neurasthenic or hysterical patient to students at a psychiatric lecture He would relate his case and his symptoms but nothing more He will make the communications necessary to the analysis only under the conditions of a special affective relationship to the physician in the presence of a single person to whom he was indifferent he would become mute For these communications relate to all his most private thoughts and feelings all that which as a socially independent person he must hide from others all that which being foreign to his own conception of himself he tries to conceal even from himself

It is impossible therefore for you to be actually present during a psycho analytic treatment you can only be told about it and can learn psycho analysis in the strictest sense of the word only by hearsay This tuition at second hand so to say puts you in a very unusual and difficult position as regards forming your own judgment on the subject which will therefore largely depend on the reliance you can place on your informant

Now imagine for a moment that you were present at a lecture in history instead of in psychiatry and that the lecturer was dealing with the life and conquests of Alexander the Great What reason would you have to believe what he told you? The situation would appear at first sight even more unsatisfactory than in the case of psycho analysis for the professor of history had no more part in Alexander s campaigns than you yourselves the psycho analyst at least informs you of matters in which he himself has played a part But then we come to the question of what evidence there is to support the historian He can refer you to the accounts of early writers who were either contemporaries or who lived not long after the events in question such as Diodorus Plutarch Arrian and others he can lay before you reproductions of the preserved coins and statues of the king and pass round a photograph of the mosaic at Pompeii representing the battle at Issus Yet strictly speaking all these documents only prove that the existence of Alexander and the reality of his deeds were already believed in by former generations of men and your criticism might begin anew at this point

not valid arguments against conclusions which claim to represent the objective results of scientific investigation, the opposition must be translated into intellectual terms before it can be expressed. It is a characteristic of human nature to be inclined to regard anything which is disagreeable as untrue, and then without much difficulty to find arguments against it. So society pronounces the unacceptable to be untrue, disputes the results of psycho-analysis with logical and concrete arguments, arising however in affective sources, and clings to them with all the strength of prejudice against every attempt at refutation.

But we, on the other hand, claim to have yielded to no tendency in propounding this objectionable theory. Our intention has been solely to give recognition to the facts as we found them in the course of painstaking researches. And we now claim the right to reject unconditionally any such introduction of practical considerations into the field of scientific investigation, even before we have determined whether the apprehension which attempts to force these considerations upon us is justified or not.

These now are some of the difficulties which confront you at the outset when you begin to take an interest in psycho-analysis. It is probably more than enough for a beginning. If you can overcome their discouraging effect, we will proceed further.

SECOND LECTURE

The Psychology of Errors

We shall now begin, not with postulates, but with an investigation. For this purpose we shall select certain phenomena which are very frequent, very familiar and much overlooked, and which have nothing to do with illness, since they may be observed in every healthy person. I refer to the errors that everyone commits as when anyone wishes to say a certain thing but uses the wrong word (slip of the tongue) or when the same sort of mistake is made in writing (slip of the pen) in which case one may or may not notice it; or when anyone reads in print or writing something other than what is actually before him (misreading), or when anyone mis-hears what is said to him, naturally when there is no question of any disease of the auditory sense-organ. Another series of such phenomena are those based on forgetting something, temporarily though not permanently, as for instance when anyone cannot think of a name which he knows quite well and is always able to recognize whenever he sees it, or when anyone forgets to carry out some intention, which he afterwards remembers, and has therefore forgotten only for a certain time. This element of transitoriness is lacking in a third class of which mislaying things so that they cannot be found is an example. This is a kind of forgetfulness which we regard differently from the usual kind; one is amazed or annoyed at it, instead of finding it comprehensible. Allied to this are certain *mistakes* in which the temporary element is again noticeable, as when one believes something for a time which both before and afterwards one knows to be untrue, and a number of similar manifestations which we know under various names.

Some inner relation between all these kinds of occurrences is indicated in German, by the use of the prefix *ver* which is common to all the words designating them. These words almost all refer to acts of an unimportant kind, generally temporary and without much significance in life. It is only rarely that anything of the kind, such as the loss of some object, attains any practical importance. For this reason little attention is paid to such happenings and they arouse little feeling.

I am now going to ask you to consider these phenomena. But you will object, with annoyance: "There are so many tremendous puzzles both in the wider world and in the narrower life of the soul, so many mysteries in the field of mental disorder which demand and deserve explanation, that it really seems frivolous to waste labour and interest on these trifles. If you could explain to us how a person with sound eyes and hearing in broad daylight comes to see and hear things which do not exist, or how anyone can suddenly believe that his nearest and dearest are persecuting him, or can justify with the most ingenious arguments a delusion which would seem nonsensical to any child, then we might be willing to take psycho-analysis seriously. But if psycho-analysis can not occupy us with anything more interesting than the question why a speaker uses a wrong word or why a *Hausfrau* mislays her keys and similar trivialities, then we shall find something better to do with our time and our interest."

My reply is: Patience! Your criticism is not on the right track. It is true that psycho-analysis cannot boast that it has never occupied itself with trifles. On the contrary, the material of its observation is usually those commonplace occurrences which have been cast aside as

lation of bodily and mental disorder becomes comprehensible To this end it must dissociate itself from every foreign preconception wheth er anatomical chemical or physiological and must work throughout with conceptions of a purely psychological order and for this very reason I fear that it will appear strange to you at first

For the next difficulty I shall not hold you your training or your mental attitude respon sible There are two tenets of psycho analysis which offend the whole world and excite its re sentment the one conflicts with intellectual the other with moral and aesthetic prejudices Let us not underestimate these prejudices they are powerful things residues of valuable even necessary stages in human evolution They are maintained by emotional forces and the fight against them is a hard one

The first of these di pleasing propositions of psycho analysis is this that mental processes are essentially unconscious and that those which are conscious are merely isolated acts and parts of the whole psychic entity Now I must ask you to remember that on the con trary we are accustomed to identify the mental with the conscious Consciousness appears to us as positively the characteristic that defines mental life and we regard psychology as the study of the content of consciousness This even appears so evident that any cont d of t

the conscious and the psychic The psycho an alytical definition of the mind is that it com prises processes of the nature of feeling think ing and wishing and it maintains that there are such things as unconscious thinking and un conscious wishing But in doing so psycho analysis has forfeited at the outset the sympa thy of the sober and scientifically minded and incurred the suspicion of being a phantastic cult occupied with dark and unfathomable mys teries You yourselves must find it difficult to understand why I should stigmatize an abstract proposition such as The psychic is the con scious as a prejudice nor can you guess yet what evolutionary process could have led t he d l of h

u as co extensive with con ciousness or whether it may be said to stretch beyond this limit and yet I can assure you that the acceptance of unconscious mental processes represents a decisive step towards a new orien tation in the world and in science

As little can you suspect how close is the con nection between this first bold step on the p of psycho analysis and the second to which I am now coming For this next proposit which we put forward as one of the of ps impu in bot a pecu part never before sufficiently appreciated in the causation of nervous and mental disorders Nay more that these sexual impulses have contributed invaluably to the highest cultural artistic and social achieve ments of the human mind

In my opinion it is the aversion from this conclusion of psycho analytic investigation that is the most significant source of the opposition it has encountered Are you curious to know how we ourselves account for this? We believe that civilization has been built up under the pressure of the struggle for existence by sac rifices in gratification of the primitive impulses and that it is to a great extent forever being re created as each individual successively join ing the community repeats the sacrifice of his instinctive pleasures for the common good The sexual are amongst the most important of the instinctive forces thus utilized they are in this way sublimated that is to say their energy is turned aside from its sexual goal and diverted towards other ends no lon er sexual and so cially more valuable But the structure thus built up is insecure for the sexual impul es are with difficulty controlled in each individual who takes up his part in the work of civiliza tion there is a danger that a rebellion of the sexual impulses may occur a ainst this diver sion of their energy Society can conceive of no more powerful menace to its culture than would arise from the liberation of the sexual impulses and a return of them to their or nal goal Therefore society dislikes this sensiti e place in its development being touched upon that the power of the sexual instinct should be reco nized and the significance of the ind vidual s sexual life revealed is very far from its interests with a vi w to discipline it has rather taken the course of diverting attention away from this whole field For this reason the reve lations of p ycho analysis are not tolerated by it and it would greatly prefer to brand them as aesthetically offen ive morally reprehen ble or dangerous But since such objections are

voted to t It can then very eas ly be d sturbed and inexactl performed Sl ght illness or a change in the d stribut n of blood n the central organ of the nervous system can ha e the same effect by these co dit ns affecting the determini g f ctor the distributi n of at tent in a similar w y In all cases it would be a quest on of the effects of a disturbance of the atte ti from organic or psychical causes

B t all this doesn t seem to promise much of int rest for psycho-analytic i rest gat We might feel tempted to gi e up the topic. To be sure a closer in pection of the facts hows that they are not all in accord with the a tention theory f errors of this sort o at least that not e erything can be directly deduced from t. We fi d that such errors and uch forgetfuln ss al o take place whe people are not f t gued o exc ted but are in every way in the nor mal conditio unles just because of the errors we were subsequently to attribute to them c dit n of excit ment which they themselves did not acknowledge Nor can the matter be quite so simpl as that the successful perf rman f an act will be ensured by an inte sification of attent on or e dangered by diminut on of t For a great number f ac tions may be carried out in a purely automatic way with very little ttent on and yet quite uc essfully In walking a man may perhaps carcel know wh re h is going but keep to th right road and stop at his destination with out ha g go e astray At least this is what usuall happens A practised pianist strikes th right notes with ut thinking of them He may f ourse also make an occasional mis tak but i utomat pla ing increa ed the dange f err rs the virt oso whose constant practice has m d his playing ntirely uto-matic w uld be th most exposed t this dan ger Y t w see n th contrary that many cts are m t su cessfully carried out when they re ot the obj cts of particularly ncen trated ttent on and that m t kes may occur just on occas ons when ne is most eager to be ccurat that is wh n a distract n of the essary tt ti is most rtainly t pres e t On ould th say that this i the effect f th cit ment but w do t understa d why th excit ment does n t rath intensify th entrati on th end s much desired. So that if in an mportant speech a vo says th oppos t f what h intend it can hardly be xplai ed ording t the psycho-phys o-logical o the attention theory

There are also many th r minor features in connection with these errors wh ch we do not understand and wh ch are not rendered more comprehen ble by these explanati ns. For in stance when one has temporarily forgotten a name one is annoyed one is determi ed to re call it and ca not desist from the attempt Why is it that desp te this annoyance the person so often cannot succeed as he wishes in directi g his attent on to the word which as he says is on the tip of his tongu and which he in stantly recognizes when it is supp ed to him? Or to take another examp e there are cases in which the errors multiply link themsel es to gether or act as subst tutes for one another The first time o e forgets an appo tment the next t me after ha ing made a special res u-t on not to forget it one d sco ers that one has made a mistake in the da or hour Or one tries by devious wa s t remember a forgotten word and in th course of so d n, loses track of a second name wh h would have been of use in finding the first. If one then pursues the second name a third gets lost and so on It is no ori ous that the same th ng happens with misprints, which are of course errors on the part of the compos tor A stubborn error of this sort is said once to have crept into a Soc al Democrat c newspaper where in the account of a fest ity the following words were printed Amo gst those p esent was His H ghness the Clown Prince The next day a correct on was at tempted The paper apolo ized and sa d "The sentence sh uld of course ha e read 'the Crow Pri ce Agai in a wa -correspondent s ac count of meeting a famous general whose in firmities were pretty well known a ref rence to the ge eral was printed as this battle scared veteran. Next day an apology appeared which read the words of course should ha e been 'the bottle- carred veteran '* We like to at tribut these occurrences to a devil in the type setting machine o to some male olent gobl n —figurat e express ns which at least imply somethi g m re than a psycho physi logical theory f the m sprint.

I d not know if ou are aware of the fact that slips of the to gue can be provoked called f rth by suggestion as t were An anecdote will serve to illustrate this. Once when a novice on th stag was ntrusted with the important part in *Th Maid of Orl ns* of announcing to th Ki g The Constable sends ba k his sword the principal player d ring the re-hearsal played the j ke f everal times re pe ting to th timi d beginner instead of the

* English example.—TR.

all too insignificant by other sciences the refuse so to speak of the phenomenal world But in your criticism are you not confounding the magnitude of a problem with the conspicuous nature of its manifestations? Is it not possible under certain conditions and at certain times for very important things to betray themselves in very slight indications? I could easily cite many instances of this What slight signs for instance convey to the young men in my audience that they have gained a lady s favour? Do they expect an explicit declaration a passionate embrace or are they not content with a glance which is almost imperceptible to others a fleeting gesture a handshake prolonged by a second? Or suppose you are a detective engaged in the investigation of a murder do you actually expect to find that the murderer will leave his photograph with name and address on the scene of the crime? Are you not perforce content with slighter and less certain traces of the person you seek? So let us not under value small signs perhaps from them it may be possible to come upon the tracks of greater things Besides I think as you do that the larger problems of the world and of science have the first claim on our interest But on the whole it avails little to form a definite resolution to devote oneself to the investigation of this or that great problem One is then often at a loss how to set about the next step In scientific work it is more profitable to take up whatever lies before one whenever a path towards its exploration presents itself And then if one carries it through thoroughly without prejudice or pre conceptions one may with good fortune and by virtue of the interrelationship linking each thing to every other (hence also the small to the great) find even in the course of such humble labour a road to the study of the great problems

It is from this point of view that I hope to enlist your interest in considering the apparently trivial errors made by normal people I propose now that we question someone who has no knowledge of psycho analysis as to how he explains these occurrences

His first answer is sure to be Oh they are not worth any explanation they are little accidents What does the man mean by this? Does he mean to maintain that there are any occurrences so small that they fail to come within the causal sequence of things that they might as well be other than they are? Anyone thus breaking away from the determination of natural phenomena at any single point has thrown over the whole scientific outlook on the world (*Weltanschauung*) One may point out to him how much more consistent is the religious outlook on the world which emphatically assures us that not one sparrow shall fall to the ground except God wills it I think our friend would not be willing to follow his first answer to its logical conclusion he would give way and say that if he were to study these things he would soon find some explanation of them It must be a matter of slight functional disturbances of inaccuracies of mental performance the conditions of which could be discovered. A man who otherwise speaks correctly may make a slip of the tongue (1) when he is tired or unwell ([2]) when he is excited or (3) when his attention is concentrated on something else. It is easy to confirm this Slips of the tongue do indeed occur most frequently when one is tired, or has a headache or feels an attack of migraine coming on Forgetting proper names very often occurs in these circumstances many people are habitually warned of the onset of an attack of migraine by the inability to recall proper names In excitement too one mixes up words or even things one performs actions erroneously and the forgetting of intentions as well as a number of other undesigned acts comes to the fore when one is distracted in other words, when the attention is concentrated on other things A familiar instance of such distraction is the professor in *Fliegende Blatter* who forgets his umbrella and takes the wrong hat, because he is thinking of the problems which are to be the subject of his next book We all know from our own experience how one can forget to carry out intentions or promises when something has happened in the interval that absorbs one very deeply

This seems so entirely comprehensible and also irrefutable It is perhaps not very interesting or not so much so as we expected Let us look at this explanation of errors more closely The various conditions which have been cited as necessary for the occurrence of these phenomena are not all similar in kind Illness and disorders of the circulation afford a physiological basis for an affection of the normal functions excitement tiredness and distraction are conditions of a different kind which could be described as psycho physiological These last could easily be converted into a theory Fatigue as well as distraction and perhaps also general excitement cause a dissipation of the attention from which it may follow that the act in question has insufficient attention de-

anticipation and perseveration which are not at all frequent in other forms of slips of the tongue the question of such sound priorities even if they exist does not enter at all for the most frequent type of slip is that in which instead of a certain word one says another which resembles it and this resemblance is considered by many people sufficient explanation of it. For instance a professor may say in his one d

However I hope I am not mistaken in thinking that in the course of our examination of the above examples an impression has formed itself in us which may be of a kind to repay further attention We were considering the general conditions under which slips of the tongue occur and then the influences which determine the kind of distortion effected in the ... but so far we have not examined at all the

tem g I mean, the *tempted* (*Versuchungen* instead of *Vers ch*)

The commonest and also the most noticeable form of slip of the tongue however is that of saying the exact opposite of what one meant to say These cases are quite outside the effect of any relations between sounds or confusion due to similarity and by default one must therefore turn to the fact that opposites have a strong conceptual connection with one another and are psychologically very closely associated. There are well known examples of this sort For instance the President of our Parliament once opened the session with the words Gentlemen I declare a quorum present and herewith declare the session *closed*

Another common association may work in a way as insidious as the association of opposites and may on occasion lead to results as inopportune So there is a story to the effect that, at a festivity in honour of the marriage of a child of H Helmholtz with a child of the well known inventor and captain of industry W Siemens the famous physiologist Du Bois Reymond was asked to speak. He concluded his doubtless brilliant speech with the toast Success to the new partnership Siemens and *Halske* which was of course the name of the old firm The association of the two names must have been as familiar to a resident of Berlin as Crosse & Blackwell to a London

So the effect of word associations must be taken into account as well as that of sound values and similarities between words. But even that is not enough In one type of case before we can arrive at an adequate explanation of the slip we must consider some phrase which had been said, or perhaps only thought, previously Again, that is a case of perseveration as Meringer insists but arising in a more distant source—I must confess that altogether I have the impression that we are further than ever from comprehension of slips of the tongue.

amples the ... What does it mean when we say it makes sense ? Well it means that the result of the slip may perhaps have a right to be regarded in itself as a valid mental process following out its own purpose and as an expression having content and meaning Hitherto we have only spoken of errors but now it appears as if the error could sometimes be quite a proper act except that it has intruded itself in the place of one more expected or intended

In certain cases the sense belonging to the slip itself appears obvious and unmistakable When the President in his opening speech closes the session of Parliament a knowledge of the circumstances under which the slip was made inclines us to see a meaning in it He expects no good result from the session and would be glad to be able to disperse forthwith there is no difficulty in discovering the meaning or interpreting the sense of this slip Or when a lady appearing to compliment another says I am sure *you* must have *thrown* this delightful hat together instead of sewn it together (*aufgepatzt* instead of *aufgeputzt*) no scientific theories in the world can prevent us from seeing in her slip the thought that the hat is an amateur production Or when a lady who is well known for her determined character says My husband asked his doctor what sort of diet ought to be provided for him But the doctor said he needed no special diet he could eat and drink whatever *I* choose the slip appears clearly as the unmistakable expression of a consistent scheme

Now supposing it should turn out that not only a few cases of slips of the tongue and errors in general but the great majority of them have a meaning then the meaning of the errors to which we have hitherto paid no attention would become the point of greatest interest to us and would justifiably drive all other points of view into the background. All

text the following The *Komfortabel* sends back his steed At the performance the unfortunate actor actually made his debut with this perverse announcement though he had been amply warned against so doing or perhaps just because he had been

All these little characteristics of errors are not much illuminated by the theory of diverted attention But that does not necessarily prove the theory wrong There may be something missing a link by the addition of which the theory might be made completely satisfactory But many of the errors themselves can be considered from another aspect

Let us select slips of the tongue as the type of error best suited to our purpose We might equally well choose slips of the pen or of reading Now we must first remind ourselves that so far we have only enquired when and under what conditions the wrong word is said and have received an answer on that point only Interest may be directed elsewhere though and the question raised why just this particular slip is made and no other one can consider the nature of the mistake You will see that so long as this question remains unanswered and the *effect* of the mistake is not explained the phenomenon remains a pure accident on the psychological side even if a physiological explanation has been found for it When it happens that I make a mistake in a word I could obviously do this in an infinite number of ways in place of the right word substitute any one of a thousand others or make innumerable distortions of the right word Now is there anything which forces upon me in a specific instance just this one special slip out of all those which are possible or does that remain accidental and arbitrary and can nothing rational be found in answer to this question?

Two authors Meringer and Mayer (a philologist and a psychiatrist) did indeed in 1895 make an attempt to approach the problem of slips of the tongue from this side They collected examples and first treated them from a purely descriptive standpoint This of course does not yet furnish any explanation but it may lead the way to one They differentiated the distortions which the intended phrase suffered through the slip into interchanges (in the positions of words syllables or letters) anticipations perseverations compoundings (contaminations) and substitutions I will give you examples of these authors main categories As an instance of an interchange (in the position of words) someone might say The Milo of Venus instead of The Venus of Milo The well known slip of the hotel boy who knocking at the bishop s door nervously replied to the question Who is it? The Lord, my boy! is another example of such an interchange in the position of words In the typical Spoonerism the position of certain letters is interchanged as when the preacher said How often do we feel a half warmed fish within us! It is a case of anticipation if any one says The thought lies heartily instead of The thought lies heavily on my heart. A perseveration is illustrated by the well known ill fated toast Gentlemen I call upon (auf) you to

hiccough (=*auf*zustossen)
(auf)
to the health of our Chief
(drink) (=*an*zustossen)

And when a member of the House of Commons referred to another as the honourable member for Central *Hell* instead of Hull it was a case of perseveration as also when a soldier said to a friend I wish there were a thousand of our men *mortified* on that hill, Bill instead of fortified In one case the *ell* sound has perseverated from the previous words member for Central and in the other the *m* sound in men has perseverated to form mortified These three types of slip are not very common You will find those cases much more frequent in which the slip happens by a compounding or contraction as for example when a gentleman asks a lady if he may *insult* her on her way (*begleit-digen*) this contraction is made up of *begleiten*=to escort, and *beleidigen*=to insult (And by the way a young man addressing a lady in this way will not have much success with her) A substitution takes place when a poor woman says she has an incurable *infernal* disease [2] or in Mrs. Malaprop s mind when she says for instance few gentlemen know how to value the *ineffectual* qualities in a woman

The explanation which the two authors attempt to formulate as the basis of their collection of examples is peculiarly inadequate They hold that the sounds and syllables of a word have different values and that the innervation of the sounds of higher value can interfere with those of lower value They obviously base this conclusion on the cases of

Komfo t b l is sla g V nnes exp es i n f one-horse cab —TR.

concealed it from him altogether namely that even before the lot he was h. and loved him this the poet with exquisite fin ness of psychological feeling causes to com to expres on i her lip and is able by this artistic device to relieve the unbearable uncertainty of the lover as well as the suspense of the audience as to the issue of th cho ce

And notice at the end how subtly Portia reco ciles the two declarations which re con tained in the slip how she reso ves th con tradictio between them and finally even jus tifies th slip

but I mea then y urs
A d all yours

It ha happened that other thinkers outs de the fi ld of medicine ha e discl ed by a observation the meaning of o e rror and so anticipated our efforts in this direction You all know th witty satirist Lichtenberg (1 4 99) f whom Goethe said Where he makes a jok a problem lies co cea d. And occa sionally th lution of th p oblem is evealed in the j ke. Lichtenberg writes in his witt nd satirical N t s "He always read *Ag mem o* f *angen mm* (erb meaning t t ke for *granted*) so deeply ersed was he in Home This really co tains the wh e theory of slips in reading

At the ext l cture w will see whethe we can gree with th poet in their on eption of th meaning f psy hol gical rrors.

THIRD LECTURE

The Psychology of Errors (*Con. ued*)

At the last lecture t occurred to us t con sider th rro by itself alon apart from ts relation to the intended ct with whi h it had interf red, and w perc ed that in certain cases t seemed t betray a mea in f ts own W sa d t o rselves that f thi conclu on that the error has ts own meaning c uld be established on large scale that mea ing would soon prove m re int resting t us than the in est gation f the ondit ons under wh ch it rs nse

Le e more agree upo what we und stand by the *m aning* f mental proces This is thing lse but th intent which t serve and place in mental sequen In most f th ca es we examined we c uld bstit t f th w d *m aning* th w rds *t ion* nd *tendency* Now wa t nl decepti e ppea an poeti glorification f the rro that led us to believe that w ould see an intention in t?

Let us st ll keep to the examples of slips of the to gue a d review a larger n mber of such manifestations We then fi d whole categories of cases in which the i te io the meaning of the lip is quite obviou part cularly so i those ins ances i which the oppo e of what was intended is said. The Pres dent says in his open ing speech I d clare the ession *closed* That s surely not ambiguous The mean ng and i tention of this lip is that he wa ts to close the es on. One might well say he said so himself we only tak h m at his word. Please do not interrupt me with the objection that this is impo ible that we kn w qui e well that he wished to open the ses ion not to close it, and that h himself whom we ha e ju t recognized as the best judge of his inter ion will affirm that he mea t to open t In do g so you forget that w reed to consider the error by i self its lation t the intention wh h it d. urbs will be discussed late I o would be guilt of an error n logic, by w h you wou d cen ven entl dispose of the problem under d scus on which in English is called begging the question.

In other cases w ere the form of the slip is not exactl the oppos t of what is in ended a contrad ct ry sense m y st ll often come to expr

but it is an open confes o of a ... t sharpest contradiction to the speaker s duty to meet the situation gracef lly

In still th cases the slip mpl adds a sec ond meaning to the intended. The sentence then sounds lik a contract on an bbrevia on co densation f sev ral sentences into one Thus the det rmined lad who sa d He may eat a d drink whatever *I* choose That is as f she had said He can eat and drink what he hooses but what does t matter what he hooses It is f r m to d the choos g! Sl ps of th tongue often gi e thi impres on of b brev tion for in tan when a professo of anat my t the end of his lecture n the nasal cavit es ask whether h clas has th oughly understood it and, after a ge eral reply in the affirmati e goes on to say I can hardl be lieve that that is so s ce persons who ca th rou hl und rstand the nasal ca t es ca be counted even in city of millions on *on fi ger* I mean on the fingers of on hand Th bbreviated senten e has ts own meaning t says that the s only on person wh un derstands the subject

In ontrast to these types in which th slip

physiological and psycho physiological conditions could then be ignored and attention could be devoted to the purely psychological investigation of the *sense* that is the meaning the intention in the errors With this in view therefore we shall soon consider further material

Before undertaking this however I should like to invite you to follow up another clue with me It often happens that a poet makes use of a slip of the tongue or some other error as a means of artistic expression This fact in itself proves that he thinks the error for instance a slip of the tongue has a meaning for he constructs

happen that a

the pen and th p of the pen to stand as a slip of the tongue of the character He wishes to reveal something by means of the slip and we may well enquire what that may be—whether perhaps he wishes to indicate that the person in question is distracted or over tired or is expecting a headache Of course we should not exaggerate the importance of it if poets do make use of slips to express their meaning Slips might be in reality without meaning accidents in the mental world or only occasionally have a meaning and poets would still be entitled to refine them by infusing sense into them for their own purposes However it would not be surprising if more were to be learned from poets about slips of the tongue than from philologists and psychiatrists

There is an example of a slip of this kind in Schiller s *Wallenstein* (Piccolomini Act I Scene 5) In the foregoing scene young Max Piccolomini had taken up Duke Wallenstein s cause ardently and had been passionately describing the blessings of peace which he had become aware of in the course of a journey accompanying Wallenstein s beautiful daughter to the camp As he leaves the stage his father (Octavio) and the courtier Questenberg are plun ed in consternation The fifth scene continues

QUESTENBERG Alas! and stands it so?
Fr end do we let h m go
In th s delus ? let h m go f om us?
N t all him back at once not
Open his eyes h re and now?
OCTAVIO (*recove ing h m lf out f deep thought*)
He has now ope ed *m e*
And I see mo e than pleases me
QUESTENBERG Wh t is it?
OCTAVIO A curse upon this journey!
QUESTENBERG But why o? Wh t i it?
OCTAVIO Come come fr end! I must up
And follow the ill omened clue at once
And see with mine own eyes—come with me now!
QUESTENBERG What now? Where go you then?
OCTAVIO (*hast ly*) *To her herself!*
QUESTENBERG *To*
OCTAVIO (*cor ects h mself*) To the Duke! Co
let us go

Octavio meant to say To him to the Duke but his tongue slips and he betrays (to u at least) by the words *to her* that he has clearly recognized the influence at work behind the famous young warrior s rhapsodies in favour of peace

A still more impressive example was found by O Rank in Shakespeare It occurs in the *Merchant of Venice* in the famous scene in which the fortunate suitor makes his choice amon the three caskets and I can perhaps not do better than read to you now Rank s short account of it

A slip of the tongue which occurs in Shakespeare s *Merchant of Venice* (Act III Sc 2) is exceedingly fine in the poetic feeling it shows and in the brilliant way in which it is applied technically Like the slip in Wallenstein quoted by Freud in his *Psycho pathology of Everyday Life* it shows that the poets well understand the mechanism and meaning of such slips and assume that the audience will also understand them Portia who by her father s wish has been bound to the choice of a husband by lot, has so far escaped all the unwelcome suitors by the luck of fortune Having at last found in Bassanio the suitor to whom she is inclined she fears that he too will choose the wrong casket She would like to tell him that even so he may rest assured of her love but she is prevented by her oath In this inner conflict the poet makes her say to her chosen suitor

I pray you tarry pause a day or two
B fore you ha a d for in choosin wr n
I l se you c mp ny th refo e fo bear awhile
There s somethi g tells me (but t is not lo e)
I would n t lose y u
I c uld teach you
Ho t choose r ght but th n I am forsw rn
S w ll I n ver b so may you m s me
But if you do y u'll make me wish a sin
That I had b en forsw rn Besh ew your eyes,
Th y have o e l oked me d d vided me
O e h lf of me is you s th othe h lf yo rs—
M n I would s y b t if min then yours,
And so all you s

Just that which she only meant to ind ca e subtly to him because she should really have

absent-mindedness and distraction of attention play in regard to the mental nature of errors. Besides this, it is clearly seen that of the two competing meanings in the slip one is always manifest, but not always the other. How is one to discover the latter? And if one believes that one has guessed it, how is one to find proof that this is not merely a probability but the only true meaning? Is there anything else you wish to ask? If not, then I myself will continue. I will remind you that we are not really greatly concerned with errors in themselves, but that we wished to learn from a study of them something of value from the point of view of psycho-analysis. Therefore I will put this question: "What sort of purposes or tendencies are these which thus interfere with other intentions, and what is the relation between the interfering tendency and the other?" Thus, as soon as we have found the answer to the riddle, our efforts begin again.

Very well then: is this the explanation of all cases of slips of the tongue? I am very much inclined to think so, and for this reason, because whenever one examines an instance, for this type of solution may be found. Still, one cannot prove that slips of the tongue cannot come to pass without the agency of this mechanism. It may be so; for our purposes it is no matter, for all events theoretically, for the conclusions which we wish to draw by way of an introduction to psycho-analysis remain valid, even if only a small proportion of the total incidence of slips of the tongue comes under our explanation, and this is certainly not so. The next question, whether this explanation extends to other forms of errors, may be answered by way of anticipation in the affirmative. You can convince yourselves of it when we turn to consider examples of slips of the pen, of wrongly performed acts, and so on. I propose, however, for technical reasons that we should postpone doing this until we have investigated the slip of the tongue itself more thoroughly.

The question what significance those factors which some writers have pointed to the foreground can now have for us—such factors as disturbances of the circulation, fatigue, excitement, distraction, disturbances of attention—demands a more exhaustive reply if we assume the mental mechanism of slips described above. You will observe that we do not deny these factors. Indeed, in general it doesn't often happen that psycho-analysis contests anything which is maintained in other quarters; as a rule, psycho-analysis only adds something new to what has been said, and it does certainly happen on occasion that what has hitherto been overlooked and is now supplied by psycho-analysis is the most essential part of the matter. The influence of such physiological predispositions as arise in slight illness, circulatory disturbances and conditions of fatigue upon the occurrence of slips of the tongue is to be admitted without more ado; everyday personal experience may convince you of it. But how little is explained by this admission! Above all, these are not necessary conditions of errors. Slips of the tongue may just as well occur in perfect health and normal conditions. These bodily factors, therefore, are merely contributory; they only favour and facilitate the peculiar mental mechanism which produces slips of the tongue. I once used an illustration for this state of things which I will repeat here, as I know of no better. Just suppose that on some dark night I am walking in a lonely neighbourhood and am assaulted by a rogue who seizes my watch and money, whereupon, since I could not see the robber's face clearly, I make my complaint at the police-station in these words: "Loneliness and darkness have just robbed me of my valuables." The police officer might reply to me: "You seem to carry your support of the extreme mechanistic point of view too far for the facts. Suppose we put the case thus: Under cover of darkness and encouraged by the loneliness of the spot, some unknown thief has made away with your valuables. It seems to me that the essential thing to be done is to look about for the thief. Perhaps we shall then be able to take the plunder from him again."

Psycho-physiological factors such as excitement, absent-mindedness, distraction of attention, obviously provide very little in the way of explanation. They are mere phrases: they are screens, and we should not be deterred from looking behind them. The question is rather what has here called forth the excitement, the particular diversion of attention. The influence of sound-values, resemblances between words, and common associations connecting certain words must also be recognized as important. They facilitate the slip by pointing out a path for it to take. But if there is a path before me, does it necessarily follow that I must go along it? I also require a motive to determine my choice and, further, some force to propel me forward. These sound-values and word-associations are, therefore, just like the bodily conditions, the facilitating causes of

u rectly controverts our ex pectations The mis pronunciation by mistake of proper names or the enunciation of mean ingless sounds is such a frequent occurrence that this alone would appear to dispose at once of the question whether all errors have a mean ing Yet close n

u that the differ ence between the e unintelligible cases and the previous more comprehensible ones is not so very great

The owner of a horse on being asked how it was replied O it may *stad*—it may *take* another month Asked what he really meant to say he answered that he was thinking it was a *sad* business and the words *sad* and *take* to gether gave rise to *stad* (Meringer and Mayer)

Another man was relating some objection able incidents and went on and then certain facts were *refilled* He explained that he meant to say these facts were *filthy* *Revealed* and *filthy* together combine to form *refilled* (Mer inger and Mayer)

You will recall the case of the young man who offered to insort an unknown lady We took the liberty of resolving this word into *insult* and *escort* and were quite convinced of this interpretation without requiring proof of it From these examples you can see that even these more obscure cases can be explained as the concurrence or *interference* of two dif ferent intentions of speech with one another the differences arise only in that in the first type of slip the one intention has entirely ex cluded the other as when the opposite is said while in the second type the one intention only succeeds in distorting or modifying the other from which arise combinations of a more or less senseless appearance

We believe that we have now discovered the secret of a large number of slips of the tongue If we keep this clear in mind we shall h h

ps of the tongue they are attempts to liken the name to something derogatory or degrading a com mon form of abuse which educated persons soon learn to avoid but nevertheless do not willingly give up It may be dressed up as a joke although one of a very low order To quote one gross and ugly example of such a distortion of a name the name of the Presi dent of the French Republic *Poincaré* has lately been transformed into *Schweinskarré* It is not going much further to assume that so e such abusive intention may also be behind dis tortions of names produced by a slip of the tongue In pursuing our idea similar explana tions suggest themselves for cases of slips where the effect is comic or absurd In the case of the member of parliament who referred to the honourable member for Central Hell the sober atmosphere of the House is unex pectedly disturbed by the intrusion of a word that calls up a ludicrous and unflattering im age we are bound to conclude from the anal ogy with certain offensive and abusive expres sions that an impulse has interposed here to this effect You needn t be taken in I don't mean a word of this To hell with the fellow! The same applies to slips of the tongue which transform quite harmle s words into obscene and indecent ones

We are familiar with this tendency in cer tain people intentionally to convert harmless words into indecent ones for the sake of the amusement obtained it passes for wit and in fact when one hears of a case one at once asks whether it was intended as a joke or occurred unintentionally as a slip of the tongue

Well we seem to have solved the riddle of errors with comparatively little trouble! They are not accidents they are serious mental acts they have their meanin they arise through the concurrence—perhaps better the mutual interference—of two different intentions But now I can well understand that you want to overwhelm me with a flood of questions and doubts which must be answered and resolved before we can enjoy this first result of our ef forts I certainly do not want to press any hasty conclusions upon you Let us coolly consider everything in turn

What would you like to say? Whether I think that this explanation accounts for all ca es of slips of the tongue or only for a certain num ber? Whether this conception can be extended to the many other types of errors to misread ing slips of the pen forgetting wrongly per formed actions mislaying things and so on? What part the factors of fatigue excitement,

Tw t l t bl mpl s a g l th te t (M d M y)—TR.

Now you will break off here onl to take up your res tance at another point You will con tinue We understand that it lies in the pe cuia technique of ps cho-analysis to bri g the person a alysed to gi e the oluti of its prob-lem Let us take another example that n which the afte -dinner speaker calls upon the company to *h ccouch* to the health of the r guest. The int rfering te dency is you say in this c e to rid cule thi t is which oppo es the intention t d honour But this is a mere int rpretation on your part based on ob erva tions made dependentl of th slip. If in this case you were t qu t n th perpetrator of the slip he w uld not c nfirm ou ew that he inte ded an in lt n the co trary he w uld veh me tly deny t Why do yo not ba do your u dem trable int rpret tion in the fa e of thi fl t denial

Yes th s tim you ha e lighted upon ome thin form d bl I can pict re to m s lf that unknown peak r h is probably an as ta t f the guest of h n u perhaps already a junio l ct rer him elf a young man with the brightest prospects I will press him and a k wh ther h s su e he d d ot pe c e some he dem nd

assert that what he says does not count one need not bel eve it.

C rta nly that is o But I can gi e you an ther in tance of a imilarly monstrous pro-cedure When an accused man confesses to a deed the judge believes h m b t when he de nies it the judge does not bel eve him. Were it oth rwise the law could not be adminis ered and i spite of occasional m scarriages you will adm t that the system on the whole works well.

"Well but are you a j dge and t the person wh comm ts a sl p to be accu ed before you Is a slip of th to gue crime

Perhaps we need not reject even this com paris n But see now t what deep-seated dif ferences our attempt to in est gate the appar ently harmless problems of errors has brought us differe ces which at this stage we do not know n the least how to reconcile I suggest that we hould make a temporary compromise on the ba s of the analogy with the judge and the pri oner You shall grant me that the mean ing of an error adm ts of no doubt when the subject of the an lysis acknowledges it him elf I in turn will dm t that a d rect proof f r the suspected meanin cann t be obtained if the ubject refuses us the inf rmation and of course this applies al o when the subject is not present to gi e us the informat on. As also in legal proceedings we are then thrown back upo ndicat o s n order to form a decis on the truth of which is sometimes more and some times less probable At law for practical rea so s guilt has to be d clared also on circum stantial ev dence There is no such neces ty here but ne ther are we bound to refrain from co sid rin such evidence It is a mistake to belie e that a cienc consi ts in nothing but concl si ely pro ed proposit ons and it is un just to demand that it should It is a dem nd nly made by those wh feel a cra ing for auth rity in some form and a need to replace the religious catechi m by s mething lse even f it be sc tific o e S ie ce in ts cate hi m h but few pod t c p ecepts it cons sts mai ly f statements whi h t ha developed t arying degrees of probability The capac ty t be c te t with th se approximations to certainty a d th abil ty to carry on construc t e w k desp te th lack of fi l confirm t on are actually a mark of the scientific hab t of mind

But where shall we fi d a starti g po nt for r i t rpretat ns a d the d cat ns for our proof in ases wh re the ubj ct und anal

slips of the tongue and cannot provide the real explanation of them Consider for a moment the enormous majority of cases in which the words I am using in my speech are not de ranged on account of sound resemblance to other words intimate associations with opposite meanings or with expressions in common use It yet remains to suppose with the philosopher Wundt that a slip of the tongue arises when the tendency to associations gains an ascend ance over the original intention owing to bodily fatigue This would be quite plausible if ex perience did not controvert it by the fact that in a number of cases the bodily and in another large group the associative predisposing causes are absent

Particularly interesting to me however is your next question namely by what means the two mutually disturbing tendencies may be ascertained You probably do not suspect how portentous this question is You will agree that one of these tendencies the one which is interfered with is always unmistakable the person who commits the slip knows it and ac knowledges it Doubt and hesitation only arise in regard to the other what we have called the interfering tendency Now we have already heard and you will certainly not have forgot ten that in a certain number of cases this other tendency is equally plain It is evident in the result of the slip if only we have the courage to let the slip speak for itself The President who said the opposite of what he meant—it is clear that he wishes to open the session but equally clear that he would also like to close it That is so plain that it needs no interpret ing But in the other cases in which the inter fering tendency merely distorts the original without itself coming to full expression how can the interfering tendency be detected in the distortion?

In one group of cases by a very safe and sim ple method by the same method that is by which we establish the tendency that is inter fered with We enquire of the speaker who tells us then and there after making the slip he re stores the word he originally intended O it may *stad*—no it may *take* another month Well the interfering tendency may be like wise supplied by him We say Now why did you first say *stad?* He replies I meant to say it was a sad business and in the other case in which refilled was said the speaker informs you that he first meant to say it was a filthy business but controlled himself and substituted another expression The discovery of the disturbin tendency is here as definitely established as that of the disturbed tendency It is not without

as exan

nor the

of mine

both these cases a certain in tervention was necessary in order to produce the explanation One had to ask the speaker why he made the slip what explanation he could give Without that he might have passed it by without seeking to explain it Being asked however he gave as his answer the first idea that occurred to him And see now this little intervention and the result of it constitute al ready a psycho analysis a prototype of every psycho analytic investigation that we may un dertake further

Now should I be too suspicious if I were to surmise that at the very moment at which psycho analysis begins to dawn upon you a resistance to it instantly raises itself within your mind? Are you not eager to object that information supplied by the person enquired of who committed the slip is not completely reliable evidence He naturally wishes you think to meet your request to explain his slip and so he says the first thing that he can think of if it will do at all There is no proof that that is actually how the slip arose It may have been so but it may just as well have been otherwise Something else also might have oc curred to him that would have met the case as well or even better

It is remarkable how little respect you have in your hearts for a mental fact! Imagine that someone had undertaken a chemical analysis of a certain substance and had ascertained that one ingredient of it is of a certain weight so and so many milligrams From this weight thus arrived at certain conclusions may be drawn Do you think now it would ever occur to a chemist to discredit these conclusions on the ground that the isolated substance might as well have had some other weight? Everyone recognizes the fact that it actually had this weight and no other and builds further conclu sions confidently on that fact But when it is a question of mental fact that it *was* such an idea and no other that occurred to the person when questioned you will not accept that as valid but say that something else might as well have occurred to him! The truth is that you have an illusion of a psychic freedom with in you which you do not want to give up I regret to say that on this point I find myself in sharpest opposition to your views

Now you will break off he e onl to take up your res stance at another point. You will con tinue "We und rstand that it lies in the pe culiar t chnique of psycho-analysis to bring the perso analysed to give the solution f its problems Let us tak another example that n whi h the after-dinner speaker calls upon the company to *h ccough* t the health of the r guest. The int rfering te dency is you say in this ca.e t ridicule this it is which oppo s th inte tion to d ho our But this is mere interpretatio on your part based on ob erva ti s made independently of the lip If in this case you were t qu st on the perpetrator f the slip h would n t confirm your ew that he i tended an insult on the co trary he would vehem ntly d ny it. Why do you not aband n your und m strabl interpretation in the fa e of th s flat denial?

Yes this tim you ha e lighted upo ome thi f rmidabl I can picture to m elf that unknown speaker he is probably an a. tant f the guest of hono r perhaps already a junio l cturer himself a young ma with the brightest prospects I will pres him and a.k wh ther h is ure he did n t pe cei e ome feeling in him elf antag nisti to the demand that h hould pay ho our t his chi f A n ce fuss there is He becomes mpatient a d sud d nly bur ts out at me Look here enough of this cross-examinat on o I ll make myself disgreeabl You will ruin my career with yo suspicions I simply aid *f t ssen* tead of *anst sen* because I d already said *auf* twice bef t. It the thing that M rin er calls a perseverat on and th re s n thing else t be read int it. D you und rstand me That s enough. Hm this is a startli g rea t on a

has meaning You will perhaps agree too that h ha no right to bec m um il o er pur ly theoret cal in estigatio but fter all y will think. h must know what he wanted to y and what t.

O h m st? That is pe haps t'll open to questi

N w y think you ha e m in trap So that is you technique I hea you say When the person wh comm ts slip gives an plan t whi h fits your ew th you d lare him t be th final a thority on the subject H says s himself! But f wh t h says does t su t your book, then y ddenly assert that what he says does not count one need not bel eve it

Certainly that is o But I can gi e you another n tance of a m larly monstrous procedure When an accused man confesses to a deed the ju l. believes h m but when he d n es it the judge does not bel eve h m. Were it otherw se th law could not be admini. ered and in spite of occas onal m scarriages you will adm t that the system on the whole works well.

"Well, but are you a judge a d is the person who commits a slip to be accused before you? Is a sl p f the to gue a crime?

Perhaps we need not reject even this com pari on But see now to what deep-seated dif fere ces our attempt to inves igate the appar ently harmle s p oblems of errors has brou ht us differences which at this sta.e we do not know n the lea t how to reconcile I suggest that we ho ld make a temporary comproni e on the basis of the analogy w th the judge and the prisoner You shall grant me that the mean ing of an error adm ts of no d bt when the subject of the a alysis a knowledges it him elf I i turn will admit that a direct proof fo the suspected m aning cannot be obt ined if the s bject refuses us the informat o and of c urse this pplies also when the subject is ot present t gi e us th informat on. As also in legal p oceedi gs w are then thrown back upon i dications n order to form a dec s on the truth of which is somet mes more and some times less probable At law for practical rea sons guilt has t be declared also on circum stantial ev dence There is no uch necess ty here b t neither are we bou d to refra n f om considering such ev dence It is a mistake to beli e that a cie c consists in nothi g but conclu.i ely proved propositions and it is un just to d mand that it should. It is a demand nly made by those who feel a cra ing for authority in some form and a need to replace the religi us cat hi m by something else even f t be a sci tific o e Science in its cate hi m has but few pod ct precepts it consists mai ly of statements which t ha developed t varying d grees of p babllity The capacity to be co tent with these approximat ons to cert inty and the ability to c rry on co stru ti e wo k despite th lack of final confirmation are actually mark f the scientific hab t of mi d

But wh re shall we find a tarting po t f r our int rpretati ns d the i dicat ons f r our pro f in cases wher the ubject unde anal

ysis says nothing to explain the meaning of the error? From various sources First by analogy with similar phenomena not produced by error as when we maintain that the distortion of a name by mistake has the same intention to ridicule behind it as intentional distortion of names And then from the mental situation in which the error arose from our knowledge of the character of the person who commits it and of the feelings active in him before the error to which it may be a response As a rule what happens is that we find the meaning of the error according to general principles and this to begin with is only a conjecture a tentative solution proof being discovered later by an examination of the mental situation Sometimes it is necessary to await further developments which have been so to speak foreshadowed by the error before we can find confirmation of our conjecture

I cannot easily give you evidence of this if I have to limit myself to the field of slips of the tongue although even here I have a few good examples The young man who offered to in sort the lady is in fact very shy the lady whose husband may eat and drink what *she* likes I know to be one of those managing women who rule the household with a rod of iron Or take the following case At a general meeting of a club a young member made a violent attack in a speech in the course of which he spoke of the officers of the society as *Lenders* of the Committee which appears to be a substitute for *Members* of the Committee We should conjecture that against his attack some interfering tendency was active which was it self in some way connected with the idea of *lending* As a matter of fact an informant tells us that the speaker is in constant money difficulties and was actually attempting to raise money at the time So the interfering tendency really is to be translated into the thought Be more moderate in your opposition these are the people whom you want to lend you money

If I diverge into the field of other kinds of errors I can give you a wide selection of examples of such circumstantial evidence

If anyone forgets an otherwise familiar proper name and has difficulty in retaining it in his memory—e

guess that h

of the name

consider in t

on the mental situation in which an error of this kind was made

A Mr Y fell in love with a lady who did not return the feeling and shortly after married a Mr X Although Mr Y had already known Mr X for some time and even had business relations with him he forgets his name over and over again so that he frequently has to ask someone the man s name when it is necessary to write to him Obviously Mr Y wants to obliterate all knowledge of his fortunate rival Never thought of shall he be

Another example a lady inquires of a doctor about a common acquaintance callin her by her maiden name She has forgotten the married name She admits that she strongly objected to the marriage and dislikes the husband intensely

Later we shall have much to say in other connections in regard to the forgetting of names at the moment we are chiefly interested in the *mental situation* in which the lapse of memory occurs

The forgetting of resolutions can in general be referred to an opposing current of feeling which is against carrying out the intention It is not only we psycho analysts who hold this view however it is the ordinary attitude of everyone in their daily affairs which they only deny in theory The protégé whose patron apologizes for having forgotten his request is not pacified by such an apology He thinks immediately It s evidently nothing to him he promised but he doesn t mean to do it For getting is therefore criticized even in life in certain connections and the difference between the popular and the psycho analytic conception of these errors seems to be dispelled Imagine a hostess receiving a guest with the words What is it today you were coming? I quite forgot that I had asked you for to-day or a young man confessing to his beloved that he had forgotten all about the appointment they had arranged on the last occasion He will never admit it he will rather invent on the spur of the moment the most wildly improbable hindrances which prevented his coming and made it impossible for him to communicate with her from that day to this We all know that in military service the excuse of having forgotten is worthless and saves no one from punishment the system is recognized as justifiable Here everyone is suddenly agreed that a certain mistake has a meaning and what that meaning is Why are they not consistent enough to extend their insight to other errors and then

ram many years bef re she really resumed it. I know of other women who lost the r wedu.. rmes on the honeymoon and I know too that the course f the marriage lent meanm to this accident. And now one strikin example more w.h better end It is told of a famous German chemist that his marriage never took p ce because he forgot the hour of the c re mon a.d went to the laboratory instead of to the church. He was wise enough t let the matter rest with one attempt and died unmar ried t a ripe ge.

Perhaps the idea has also come to you that in these examples mistakes seem to have re placed the omens or portents of the ancients. A.d indeed, certain kind of portents were hing but errors for instance when anyone stumbled o f ll down. It is true that another group of omens bore th haracter of objective events rather than f subjective cts B t you would ot believe how difficult it is sometimes to decid whether specific ins.a ce bel ..gs to the first category o to the second. The act knows so ften how t disguise itself as a passive experience

E ery one f us wh can look back over a fairly lon.. experienc f life w uld probably sa that he might ha e spared himself many disappointments and painful surprises f he h.d had th courage and resolution to inte pret as omens th littl mistakes whi h he ot ced in his inter ourse with th rs and t regard them as signs f tendenc es still in the background. For the most part ne does ot dare to d thi one has an impressi n that one would be m supersititi us gain by a ci cuitou cientifi path And then. t all omens com true and our th ories will sh w you how it is that they eed ot all com true

FOURTH LECTURE

The P cholog of Err s (Con lusi)

That errors ha e meaning, we may certainly set down as est blished by r ff rt up to this point and may tak this lu on s a ba..s for our furth in est gat ns Let me once m re emphasize th fact that we d ot maintain—and f our purposes d ot need t maintain—that every .ingl mistak which occurs has meaning although I think that pr bable It is en ugh f r us t prove that such meaning is relatively frequent in the various forms f errors In thi respect by th w th variou forms how certain differences Some cases f slips of th tongue slips of th pen and s on may be th effect of a purely ph s-iological cause though I cannot bel eve this poss b e of those errors which depend upon forgetfulness (f rgetti g of names or inten tions mislaying and so on) l s ng possessions is in all probab lity to be recognized as unin tent onal in some cases ltogeth r our con ceptions are only to a certa n extent appl cable to the mistakes which occur in da'ly life. These limitations should be borne in mind by you when we proceed on the assumption that errors are mental acts arising from the mutual i ter ference of tw i tentions

This is the firs result of our psycho-analys s Hithert psychology ha known nothi g of such interferences or of the poss b lity that they could occasion manifestat ons of th s kind We ha e widened the domain f men al phenomena t a ery cons d rable extent and have won for psych logy phenomena wh.ch were never before accred.ted t it.

Let us dwell for a moment o the propo i tio that errors are *men al acts* Does this mean any more than our f rmer st teme t that they ha e a meani g? I do not think so on the con trary it is a m re ind finite statement and one m re open to misunderstandi g E erythi g that can be bserved i mental life will be des igna ed at ne time or nother as a mental phenome. on. It depends however whether the particular m tal pher menon is directly d e to bodil organ c or material agencies in which

We ha e in mi d the latter state of things when

meaning and by meani g w understand i nificance tenti t d ncy and a position i sequence of me tal oncatenat s

There s anoth group of occurren es which is ery closely related to errors b t for whi h this name is not suitable W call them *acc dental* and *sympt mat c acts* They also appear to be unmot vated in. gnificant d unimpo tant but in add tion to this they have ery clearly the fe ture f uperfluity They are on th one hand d.stingui.habl from errors by th bsence of any second intentio to whi h they are opposed and which they disturb n the other hand they m rge with ut any definite line of demarcati n into the gestures and move ments which we regard as expres ons of th

tainly the finest flowers of the species If we were only concerned to prove that errors had a meaning we should have limited ourselves to them at the out et for the meaning in them is unmistakable even to the dullest intelligence and strong enou h to impress the most critical judgment. The repetition of the occurrences betrays a persistence which is hardly ever an attribute of chance but which fits well with the idea of design Further the exchanging of one kind of mistake for another shows us what is the most important and essential element in the error and that is not its form or the means of which it makes use but the *tendency* which makes use of it and can achieve its end in the most various ways Thus I will give you a case of repeated forgetting Ernest Jones relates that he once allowed a letter to lie on his writing desk for several days for some unknown rea on At last he decided to post it but received it back from the dead letter office for he had forgotten to address it After he had addressed it he took it to post but this time without a stamp At this point he finally had to admit to himself his objection to sending the letter at all

In another case taking up a thing by mistake is combined with mislaying it A lady travelled to Rome with her brother in law a famous artist The visitor was much feted by the Germans living in Rome and received among other things a present of an antique gold medal The lady was vexed because her brother

not app

After h

and dis

brought .. medal with her—how she did not know She wrote at once to her brother in law telling him that she would send the stolen property back to him the next day But the next day the medal was so cleverly mislaid that it could not be discovered and could not be returned and then it began to dawn upon the lady what her *absent mindedness* had meant namely that she wanted to keep the work of art for herself

I have already given you an example of a combination of forgetfulness with an error in the case in which someone forgets an appointment and a second time with the firm intention of not forgetting it again appears at an hour which is not the appointed one A quite analogous case was told me from his own experience by a friend who pursues literary as well as scientific interests He said Some years ago I accepted election to the Council of a certain literary society because I hoped that the society might at some time be usef

gettin

not n

regula

ay A few months ago I received an assurance that my play would be produced at a theatre in F and since then it has invariably happened that I *forget* to attend the meetings of the society When I read your writings on this subject I reproached myself with my meanness in staying away now that these people can no longer be of use to me and determined on no account to forget on the following Friday I kept remindin myself of my resolution until I carried it out and stood at the door of the meeting room To my amazement it was closed and the meeting was already over! I had made a mistake in the day of the week and it was then Saturday!

It would be tempting to collect more of these examples but I will pass on and instead let you glance at those cases in which interpretation has to wait for confirmation in the future

The main condition in these cases is as we might expect that the mental situation at the time is unknown or cannot be ascertained At the moment therefore our interpretation is no more than a supposition to which we ourselves would not ascribe too much weight Later however something happens which shows us how well justified our previous interpretation was I was once the guest of a young married couple and heard the young wife laughingly describe her latest experience how the day after the return from the honeymoon she had called for her sister and gone shopping with her as in former times while her husband went to his business Suddenly she noticed a man on the other side of the street and nud ing her sister said Look there goes Mr K She had forgotten that this man had been her husband for some weeks A shudder went over me as I heard the story but I dared not draw the inference Several years later the little incident came back to my mind after this marriage had come to a most unhappy end

Maeder tells a story of a lady who had forgotten to try on her wedding dress the day before the wedding to the despair of the dressmaker and remembered it only late in the evening He connects it with the fact that soon after the marriage she was divorced by her husband. I know a woman now divorced from her husband who in managing her money affairs frequently signed documents with her maiden

the ladies admitted that spending the day like this entailed much discomfort. It certainly is ... unpleasa t to tramp all day in the un t ... bl se ... and th s are soaked [illegible]

a d can cha ge ... (*Hose* u e us ... the lady meant to say *nach Ha se* wh ch means *home*) We d d not a al se this sl p but I am sure yo w ll e sily understa d it The l ly s intention had been to enumer te a more complete list of her clothes blouse ch m e and [illegible] mention

Now we can t rn at last to the ma i q e tion hich h s been so lo postp ned namely what kind of *tendenc es* th se are which b ng thems l es t expressi n n this unu ual way by interferi g w th other intent ons They are evidently ery arious yet our aim i to find som eleme t comm n to them all If we examine a ser es of exampl s for th purpose we shall soon fi d that they fall into three groups. T the *f st* group belong the ca e in which the i terferin tendency s kn wn to the spe ke a d more er wa felt by him before th slip Thu i the case f the sl p refilled the spe ker n t only adm tt d that h had criticized the eve ts in question as filthy but furthe that he had had th i te tio which he subsequ tly reve sed of e pressing this opinion word A *second* g oup formed by othe ses in which the interf ring tende cy is lik rec gnized by the speaker as his o n but h is t awa e that t was acti e n him bef re the slip H th ref accept our int rpretatio but r m ns t som te t s r prised by t Exampl of th s tt tude are pr b ably m re ea ly found in the errors tha in sl ps of the t ngue I the *third* gro p the int rp tat on f th terf n g tendency i en erget cally repudi ted by th peake not ly doe he d put that t w s act e n h m befo e the sl p b t he will mai ta n that it i lto geth t ly al t him Recall the case b ut hic h g d the pos t vely discourte o reb ff wh h I b ought upon myself by d tec ing th inte fering te dency Y u know th t i tt t de t wards the e c se you d I re st ll fa fr m an agr m t I sh uld make nothing of the afte -d nn r spe ke de nial and hold fast to my interpretation un waveringly while you I imag ne are till im pres ed by his vehemence and are won lering whether one should not forego the interpreta t on of such errors a d let them pa s for purely physiolog cal acts as in the days before anal ys s I can imag ne what it is that alarms you *My interpretation* includes the a sumption that te denci of which a speaker knows noth ng can expre s them el es thro h him an l that I ca deduce them from various i. t ations You he itate before a co clus on so novel an l so pregnant with consequences I understan l that and admit that up to a p nt you are justif ed B t let one th g be clear if you in tend to carry to its log cal co clu ion the con cepti n of errors which has been confirmed [illegible] make [illegible] t do [illegible] d r [illegible] sta d ng of errors [illegible] st be gun to obta n

Let us pau e a moment on that which unites the three groups and is common to the three [illegible]

been forced back The spe ker had d ter i ned not to convert the idea to speech a l the it happens that he makes a sl p of the to gue that is to say the tendency wh ch s d b red f om e presso asserts itself ag st h s will and ga s utte nce e the by altering the ex p ession of the inte t on permitt d by h m or by m gl g with it o actu lly by sett g itself i p ace of it This then is the mechanism of a sl p of the to gue

For my wn part I can br ng the proce s in the th d g up al o int perfect harmony with the m cha ism here desc bed I need only as s me that these three groups re d ffere tiated by the vary g d grees t which the forc ng back of a tenti is effecti e In the f rst gr p the i te t on is present and make its ll percept ble before the words are spoken not unt l then does it s ffer the rejection for wh ch it indem f s itself in the sl p In the s cond gro p the reject on reaches further back the intenti n is o longer perceptible even bef re the speech. It is rem Lable that th does not hi d r it in the least from be ng the acti e c se of the sl p But th s state f things s mp l fi s the explanation of the process in the thi l

emotions To this class of accidental performances belong all those apparently purposeless acts which we carry out as though in play with clothing parts of the body objects within reach also the omission of such acts and again the tunes which we hum to ourselves I maintain that all such performances have meaning and are explicable in the same way as are errors that they are slight indications of other more important mental processes and are genuine mental acts I propose however not to linger over this further extension of the field of mental phenomena but to return to the errors for by a consideration of them problems of importance in the enquiry into psycho analysis can be worked out much more clearly

Undoubtedly the most interesting questions which we formulated while considering errors and have not yet answered are the following We said that errors result from the mutual interference of two different intentions of which one may be called the intention interfered with and the other the interfering tendency The intentions interfered with give rise to no further questions but concerning the others we wish to know first what kind of intentions these are that arise as disturbers of others and secondly what are the relations between the interfering tendencies and those which suffer the interference?

Allow me to take slips of the tongue again as representative of the whole series and to answer the second question before the first

The interfering tendency in the slip of the tongue may be connected in meaning with the intention interfered with in which case the former contains a contradiction of the latter or corrects or supplements it Or in other more obscure and more interesting cases the interfering tendency may have no connection whatever in meaning with the intention interfered with

Evidence for the first of these two relationships can be found without difficulty in the examples already studied and in others similar to them In almost all cases of slips of the tongue where the opposite of what is meant is said the interfering tendency expresses the opposite meaning to that of the intention interfered with and the slip is the expression of the conflict between two incompatible impulses I declare the meeting open but would prefer to have clo ed it is the meaning of the President s slip A political paper which had been accused of corruption defends itself in an article meant to culminate with the words Our readers will testify that we have always laboured for the public benefit in the most *disinterested* manner But the editor entrusted with the composition of the defence wrote in the most *interested* manner That is to say he thinks I have to write this stuff but I know better A representative of the people urging that the Kaiser should be told the truth *ruckhaltslos* (unreservedly) hears an inner voice terrified at his boldness and by a slip of the tongue transforms *ruckhaltslos* into *ruckgratslos* (without backbone ineffectually)

In the examples already given which produce an impression of contraction and abbreviation the process represents a correction addition or continuation in which a second tendency manifests itself alongside the first Things were then revealed but better say it straight out they were filthy therefore—thin s were then *refilled* The people who understand this subject may be counted on the fingers of one hand but no there is really only one person who understands it very well then—can be counted on *one finger* Or my husband can eat and drink what he likes but you know *I* don t permit him to like this and that so then—he may eat and drink what *I* like In all these cases the slip arises from the content of the intention interfered with or is directly connected with it

The other kind of relationship between the two interfering tendencies seems strange If the interfering tendency has nothing to do with the content of the one interfered with whence comes it then and how does it happen to make itself manifest just at that point? Observation which alone can supply the answer to this shows that the interfering tendency proceeds from a train of thou ht which has occupied the person shortly before and then reveals itself in this way as an after effect irrespective of whether or not it has already been expressed in speech It is really therefore to be described as a perseveration though not necessarily a perseveration of spoken words An associative connection between the interfering tendency and that interfered with is not lacking here either though it is not found in the content but is artificially established sometimes with considerable *forcing* of the connections

Here is a simple example of this which I observed myself Once in the beautiful Dolomites I met two Viennese ladies who were starting for a walking tour I accompanied them part of the way and we discussed the pleasures but also the trials of this way of life One of

the ladies admitted that spending the day like this entailed much discomfort. *It certainly is very unpleasant to tramp all day in the sun till one's blouse ... and things are soaked through.* In this sentence she had to overcome a slight hesitation at one point. Then she continued: *But then when one gets nach Hose and can change ...* (*Hose* means drawers; the lady meant to say *nach Hause* which means *home*). We did not analyse this slip but I am sure you will easily understand it. The lady's intention had been to enumerate a more complete list of her clothes, "blouse, chemise and drawers." From motives of propriety mention of the drawers (*Hose*) was omitted, but in the next sentence, the content of which is quite independent, the unuttered word came to light as a distortion of the word it resembled in sound, *hom* (*Hause*).

Now we can turn at last to the main question which has been so long postponed, namely what kind of tendencies these are which bring themselves to expression in this unusual way by interfering with other intentions. They are, of course, very various, but our aim is to find some element common to them all. If we examine a series of examples for this purpose we shall soon find that they fall into three groups. To the *first* group belong the cases in which the interfering tendency is known to the speaker and moreover was felt by him before the slip. Thus in the case of the slip "refilled" the speaker not only admitted that he had criticized the events in question as filthy, but further that he had had the intention, which *he subsequently reversed*, of expressing this opinion in words. A second group is formed by other cases in which the interfering *tendency* is likewise recognized by the speaker as his own, but he is not aware that it was active in him before the slip. He therefore accepts our interpretation but remains to some extent surprised by it. Examples of this attitude are probably more easily found in other errors than in slips of the tongue. In the third group the interpretation of the interfering tendency is energetically repudiated by the speaker; not only does he dispute that it was active in him before the slip, but he will maintain that it is altogether entirely alien to him. Recall the case of the hiccoughing and the positively discourteous rebuff which I brought upon myself by detecting the interfering tendency. You know that in our attitude towards these cases you and I are still far from an agreement. I should make nothing of the after-dinner speaker's denial and hold fast to my interpretation unwaveringly, while you, I imagine, are still impressed by his vehemence and are wondering whether one should not forego the interpretation of such errors and let them pass for purely physiological acts, as in the days before analysis. I can imagine what it is that alarms you. My interpretation includes the assumption that tendencies of which a speaker knows nothing can express themselves through him and that I can deduce them from various indications. You hesitate before a conclusion so novel and so pregnant with consequences. I understand that, and admit that up to a point you are justified. But let one thing be clear: if you intend to carry to its logical conclusion the conception of errors which has been *confirmed* by so many examples, you must decide to make this *startling assumption*. If you cannot do this you will have to abandon again the understanding *of errors* which you had only just begun to obtain.

Let us pause a moment on that which unites the three groups and is common to the three mechanisms of a slip of the tongue. Fortunately this common element is unmistakable. In the first two groups the interfering tendency is admitted by the speaker; in the first, there is the additional fact that it showed itself immediately before the slip. But in both cases *it has been forced back. The speaker had determined not to convert the idea into speech and then it happens that he makes a slip of the tongue; that is to say, the tendency which is debarred from expression asserts itself against his will and gains utterance, either by altering the expression of the intention permitted by him, or by mingling with it, or actually by setting itself in place of it.* This then is the mechanism of a slip of the tongue.

For my own part I can bring the process in the third group also into perfect harmony with the mechanism here described. I need only assume that these three groups are differentiated by the varying degrees to which the forcing back of an intention is effective. In the first group the intention is present and makes itself perceptible before the words are spoken; not until then does it suffer the rejection for which it indemnifies itself in the slip. In the second group the rejection reaches further back; the intention is no longer perceptible even before the speech. It is remarkable that this does not hinder it in the least from being the cause of the slip. But this state of things simplifies the explanation of the process in the third

group I shall be bold enough to assume that a tendency can still express itself by an error though it has been debarred from expression for a long time perhaps for a very long time has not made itself perceptible at all and can therefore be directly repudiated by the speaker But leaving aside the problem of the third group you must conclude from the other cases that a *suppression (Unterdruckung) of a previous intention to say something is the indispensable condition for the occurrence of a slip of the tongue*

We may now claim to have made further progress in the understanding of errors We not only know them to be mental phenomena in which meaning and purpose are recognizable not only know that they arise from the mutual interference of two different intentions but in addition we know that for one of these intentions to be able to express itself by interfering with another it must itself have been subject to some hindrance against its operation It must first be itself interfered with before it can interfere with others Naturally this does not give us a complete explanation of the phenomena which we call errors We see at once further questions arising and in general we suspect that as we progress towards comprehension the more numerous will be the occasions for new questions We might ask for instance why the matter does not proceed much more simply If the intention to restrain a certain tendency instead of carrying it into effect is present in the mind then this restraint ought to succeed so that nothing whatever of the tendency gains expression or else it might fail so that the restrained tendency achieves full expression But errors are *compromise* formations they express part success and part failure for each of the two intentions the threatened intention is neither entirely suppressed nor apart from some instances does it force itself through intact We can imagine that special conditions must be present for the occurrence of such interference (or compromise) formations but we cannot even conjecture of what kind they may be Nor do I think that we could discover these unknown circumstances by penetrating further into the study of errors It will be necessary first to examine thoroughly yet other obscure fields of mental life only the analogies to be met with there can give us courage to form those assumptions which are requisite for a more searching elucidation of errors And one other point! To work from slight indications as we constantly do in this field is not without its dangers There is a mental disorder called *combinatory paranoia* in which the practice of utilizing such small indications is carried beyond all limits and I naturally do not contend that the conclusions which are built up on such a basis are throughout correct Only by the breadth of our observations, by the accumulation of similar impressions from the most varied forms of mental life can we guard against this danger

So now we will leave the analysis of errors. But there is one thing more which I might impress upon you to keep in mind as a model, the method by which we have studied these phenomena You can perceive from these examples what the aim of our psychology is Our purpose is not merely to describe [illegible] the [illegible] ab[illegible] pre[illegible]nuencies striving towards a goal, which work together or against one another We are endeavouring to attain a *dynamic conception* of mental phenomena In this conception the trends we merely infer are more prominent than the phenomena we perceive.

So we will probe no further into errors but we may still take a fleeting glimpse over the breadth of this whole field in the course of which we shall both meet with things already known and come upon the tracks of others that are new In so doing we will keep to the division into three groups made at the beginning of our study slips of the tongue with the co-ordinate forms of slips of the pen misreading mishearing of forgetting with its subdivisions according to the object forgotten (proper names foreign words resolutions impressions) and of mislaying mistaking and losing objects Mistakes in so far as they concern us are to be grouped partly under the head of forgetting partly under acts erroneously performed (picking up the wrong objects etc)

We have already treated slips of the tongue in great detail yet there is still something to add There are certain small affective manifestations related to slips of the tongue which are not entirely without interest No one likes to think he has made a slip of the tongue one often fails to hear it when made by oneself but never when made by someone else Slips of the tongue are in a certain sense infectious it is not at all easy to speak of them without making them oneself It is not hard to detect the motivation of even the most trifling forms of them although these do not throw any particular light on hidden mental processes If for

instance anyone pronounces a long vowel as a short o in consequence of a d turbance over the word no m tter how moti ated he will as a result soon fter lengthen a hort vowel and commit new sl p in compe at o for the first. The same thing occurs f anyone pro ounces a diphthong indistinctly and c reles ly for in stance ew or oy as i he tries to correct it by changing a subsequent into ew or oy Some o s d rat relating to the hea er seems to be behi d this beha our as though h were n t to be all ed to think that the speake is indiff rent how he treats his mother t gue The second compen at g d stort o actually has the purpo e of drawing the hear er' attent n to the first and assuri g him that it has ot escaped the speaker e ther The most frequent, m gn ficant and imple forms of d t nations

gi es an impress n of c rta n impat ence to be d with th se tence a d in general it points to certain re stance ag t the com h spee h lto-

eptio of slips of the to gue b come merged W a sume that in the ca es distu b g tendency s ppo in the i tend d spee h but t ca ly betray ts prese ce and n t what ts own purpose is The interf re e wh h it causes follows som ound influenc o assoc ati e nn t o and m y be egard d as distrac ti f ttention way f m th int ded speech. But th r n this d tract on of tte tion o in the asso iative t de cy whi h has be n ct vated l es th essen f the cur ence th sen l es rather th hint the ccurren gi es f the p sen e of s m othe inte ti int f ri g w th th inte ded pee h the nat f which ca ot n thi case be d co red from ts ffects po s'ble n all th mo p on u ed cases f l ps of the to gue

Slips f the pe to wh h I n w turn, s like lips f the to gue in th me harm m that w points of new re to be xpect d from th m P haps a small addit on to o r kn wl dg f m this group will co tent us Tho ery c mm little sl ps of the pen co trac tio s ant cipat f l t wo ds particularly f th last w ds point to general d t te f writin and t an mpatience to be d e more pronounced effects in sl ps of the pen allow the nature and intention of the interfer ence to be recognized In general if one finds a slip of the pen in a letter one knows that the wr te s m d was not wo k g smoothly at the moment what was the matter one cannot al ways establ h. Sl ps of the pen are frequently as l ttle noticed by those who make them as slips of the tongue The following observat on is striking in this connection There are of course some persons who have the hab t of always re read g every letter they write be fore sending it Others do not do th s but if the latt r make an except on and re read a let ter they then always ha e an opportunity of triking l p of the pen

that this is so?

There is a intere ting problem connected with the pract cal s gnificance of sl ps of the pen You may recall the case of the murderer H who ma aged by a sert ng himself to be a bacteriologist to obtain cultures of h hly dan gerous d sea e germs from scientific institu t o s but used them for the purpose of doi g away n th mo t modern fa hion with people

ple (*Mensc en*) e e attracted the ttent n of the doct rs at the institute b t so f r as I know they drew no co clu on from it Now what do you think? Wo ld it not h ve been better if the doctors had take the sl p of the pen as a confession and st rted an est gat on so that the mur d re proc ed ngs m ght ha e been rrested in tim ? In th ase does not gnorance f our c c pt on f rr rs result n gl ct wh ch n ctuality may be very impo tant? Well I know th t h a lip of the pen would cer tainly u e gre t pic on in me but there s n mporta t objection agai t regarding it as a c f n. The matter is not so s mple The sl p of the pen s c rta ly a nd cation b t l it w ld not have justified an e qu ry It does i d ed betray that th man is occup ed w th the thought of inf ct ng human be ngs b t t doe not how with certainty wh ther this th ght definite plan to do harm or a

mere phantasy of no practical importance It is even possible that a person making such a slip will deny with the soundest subjective justification the existence of such a phantasy in himself and will reject the idea as a thing utterly alien to him Later when we come to consider the difference between psychical reality and material reality you will be better able to appreciate these possibilities But this again is a case in which an error was found subsequently to have unsuspected significance

Misreading brings us to a mental situation which is clearly different from that of slips of the tongue or the pen One of the two conflicting tendencies is here replaced by a sensory excitation and is perhaps therefore less tenacious What one is reading is not a product of one s own mind as is that which one is going to write In the large majority of cases therefore misreading consists in complete substitution A different word is substituted for the word to be read without there necessarily being any connection in the content between the text and the effect of the mistake and usually by means of a resemblance between the words Lichtenberg s example of this *Agamemnon* instead of *angenommen* is the best of this group To discover the interfering tendency which causes the mistake one may put aside the original text altogether the analytic investigation may begin with two questions What is the first idea occurring in free association to the effect of the misreading (the substitute) and in what circumstances did the misreading occur? Occasionally a knowledge of the latter is sufficient in itself to explain the misreading as for instance when someone wandering about a strange town driven by urgent needs reads the word *Closethaus* on a large sign on the first storey He has just time to wonder that the board has been fixed at that height when he discovers that the word on it is actually *Corsethaus* In other cases where there is a lack of connection in content between the text and the slip a thorough analysis is necessary which cannot be accomplished without practice in psycho analytic technique and confidence in it But it is not usually so difficult to come by the explanation of a case of misreading In the example *Agamemnon* the substituted word betrays without further difficulty the line of thought from which the disturbance arose In this time of war for instance it is very common for one to read everywhere names of towns generals and military expressions which are continually in one s ears wherever one sees a word at all resembling them. Whatever interests and occupies the mind takes the place of what is alien and as yet uninteresting The shadows of thoughts in the mind dim the new perceptions

Another kind of misreading is possible in which the text itself arouses the disturbing tendency whereupon it [illegible]

[illegible] teration

In the first mentioned more frequent cases of misreading two factors to which we ascribed great importance in the mechanism of errors are inconspicuous these are the conflict between two tendencies and the forcing back of one of them which compensates itself by producing the error Not that anything contradictory of this occurs in misreading but nevertheless the importunity of the train of thought tending to the mistake is far more conspicuous than the restraint which it may have previously undergone Just these two factors are most clearly observable in the different situations in which errors occur through forgetfulness

The forgetting of resolutions has positively but one meaning the interpretation of it as we have heard is not denied even by the layman The tendency interfering with the resolution is always an opposing one an unwillingness concerning which it only remains to enquire why it does not come to expression in a different and less disguised form for the existence of this opposing tendency is beyond doubt. Sometimes it is possible too to infer something of the motives which necessitate the concealment of this antipathy one sees that it would certainly have been condemned if it declared its opposition openly whereas by craft, in the error it always achieves its end When an important change in the mental situation occurs between the formation of the resolution and its execution in consequence of which the execution would no longer be required then if it were forgotten the occurrence could no longer come within the category of errors There would be nothing to wonder at in the error for one recognizes that it would have been superfluous to remember the resolution it had been either permanently or temporarily cancelled Forgetting to carry out a resolution can only be called an error when there is no reason to believe that any such cancellation has occurred.

Cases of forgetting to carry out resolutions are usually so uniform and transparent that

they are of no interest for our researches. There are two points, nevertheless, at which something new can be learnt by studying this type of error. We have said that forgetting and not executing a resolution indicate an antagonistic tendency in opposition to it. This is certainly true, but our own investigations show that this *counter will* may be of two kinds, either immediate or mediate. What is meant by the latter is best explained by one or two examples. When the patron forgets to say a good word for his protege to some third person, it may happen because he is actually not much interested in the protégé and therefore has no great inclination to do it. This in any case will be the protégé's view of the patron's omission. But the matter may be more complicated. The

is perhaps directed against the third person to whom the recommendation was to be made. Here again, you see what objections there are against applying our interpretations practically. In spite of having correctly interpreted the error, the protégé is in danger of becoming too suspicious and of doing his patron a grave injustice. Again, if someone forgets an appointment which he had promised and was resolved to attend, the commonest cause is certainly a direct disinclination to meet the other person. But analysis might produce evidence that the interfering tendency was concerned not with the person, but with the place of meeting which was avoided on account of some painful memory associated with it. Or if one forgets to post a letter the opposing tendency may be concerned with the contents of the letter, but this does not exclude the possibility that the letter in itself is harmless and becomes the subject of a counter tendency only because something in it reminds the writer of another letter written previously which did in fact afford direct basis for antipathy. It may then be said that the antipathy has been *transferred* from the earlier letter where it was justified to the present one where it actually has no object. So you see that restraint and caution must be exercised in applying our quite well founded interpretations; that which is psychologically equivalent may in actuality have many meanings.

That such things should be must seem very strange to you. Perhaps you will be inclined to assume that the *indirect* counter will is enough to characterize the incident as pathological. But I can assure you that it is also found within the boundaries of health and normality. And further, do not misunderstand me; this is in no sense a confession on my part that our analytic interpretations are not to be relied on. I have said that *forgetting* to execute a plan may bear many meanings, but this is so only in those cases where no analysis is undertaken and which we have *to interpret* according to our general principles. If an analysis of the person in the case is carried out it can always be established with sufficient *certainty whether the antipathy* is a direct one, or what its source is otherwise.

The following is a second point: when we find proof in a large majority of cases that the forgetting of an intention proceeds from a counter will, we gain courage to extend this solution to another group of cases in which the person analysed does not confirm, but denies, the presence of the counter will inferred by us. Take as an example of this such exceedingly frequent occurrences as forgetting to return borrowed books or to pay bills or debts. We will be so bold as to suggest to the person in question, that there is an intention in his mind of keeping the books and not paying the debts, whereupon he will deny this intention but will not be able to give us any other explanation of his conduct. We then insist that he has this intention but is not aware of it; it is enough for us, though, that it betrays itself by the effect of the forgetting. He may then repeat that he had merely forgotten about it. You will recognize the situation as one in which we have already been placed once before. If we intend to carry through, to their logical conclusions, the interpretations of errors which have been proved justified in so many cases, we shall be unavoidably impelled to the assumption that tendencies exist in human beings which can effect results without their knowing of them. With this, however, we place ourselves in opposition to all views prevailing in life and in psychology.

Forgetting proper names and foreign names and words, can be traced in the same way *to a* counter tendency aiming either directly or indirectly against the name in question. I have already given you several examples *of* such direct antipathy. Indirect causation is particularly frequent here and careful analysis is generally required to elucidate it. Thus for instance in the present time of war which forces us to forego so many of our former pleasures, our ability to recall proper names suffers severely

by connections of the most far fetched kind It happened to me lately to be unable to remember the name of the harmless Moravian town of Bisenz and analysis showed that I was guilty of no direct antagonism in the matter but that the resemblance to the name of the Palazzo Bisenzi in Orvieto where I had spent many happy times in the past was responsible As a motive of the tendency opposing the recollection of this name we here for the first time encounter a principle which will later on reveal itself to be of quite prodigious importance in the causation of neurotic symptoms namely the aversion on the part of memory against recalling anything connected with painful feelings that would revive the pain if it were recalled In this tendency towards *avoidance of pain* from recollection or other mental processes this flight of the mind from that which is unpleasant we may perceive the ultimate purpose at work behind not merely the forgetting of names but also many other errors omissions and mistakes

The forgetting of names seems h ı
h -

t of an unpleasantness motive cannot be established When anyone has a tendency to forget names it can be confirmed by analytic investigation that names escape not merely because he does not like them or because they remind him of something disagreeable but also because the particular name belongs to some other chain of associations of a more intimate nature The name is anchored there as it were and is refused to the other associations activated at the moment If you recall the devices of memory systems you will realize with some surprise that the same associations which are there artificially introduced in order to save names from being forgotten are also responsible for their being forgotten The most conspicuous example of this is afforded by proper names of persons which naturally -
people
Theod
ticular w 11 be the name of father brother friend or your own name Analytic experience will show you that the former among you will be in no dan er of forgetting that some stranger bears this name whereas the latter will be continually inclined to grudge to strangers a name which to them seems reserved for an intimate relationship Now let us assume that this inhibition due to associations may coincide with the operation of the pain principle and in addition with an indirect mechanism you will then be able to form a commensurate idea of the complexity in causation of such temporary forgetting of names An adequate analysis that does justice to the facts will however completely disclose all these complications

The forgetting of impressions and experiences shows the working of the tendency to ward off from memory that which is unpleasant much more clearly and invariably than the forgetting of names It does not of course belong in its entirety to the category of errors but only in so far as it appears to us remarkable and unjustified jud ed by the standard of general experience as for instance where recent or important impressions are forgotten or where one memory is forgotten out of an otherwise well remembered sequence How and why we have the capacity of forgettin in general particularly how we are able to forget experiences which have certainly left the deepest impression on us such as the events of our childhood is quite a different problem in which the defence against painful associations plays a certain part but is far from explaining everythin That unwelcome impressions are easily forgotten is an indubitable fact Various psychologists have remarked it and the great Darwin was so well aware of it that he made a golden rule for himself of writing down with particular care observations which seemed unfavourable to his theory having become convinced that just these would be inclined to slip out of recollection

Those who hear for the first time of this principle of defence against unpleasant memory by forgetfulness seldom fail to raise the objection that on the contrary in their experience it is just that which is painful which it is hard to forget since it always comes back to mind to torture the person against his will—as for example the recollection of grievances or humiliations This fact is quite correct but the objection is not sound It is important to begin early to reckon with the fact that the mind is an arena a sort of tumbling-ground for the struggles of antagonistic impulses or to express it in non dynamic terms that the mind is made up of contradictions and pairs of opposites Evidence of one particular tendency does not in the least preclude its opposite there is room for both of them The material questions are How do these opposites stand to one another and what effects proceed from

much of them and what from the other?

Losing and mislaying objects is of especial interest on account of the numerous meanings it may have, and the multiplicity of the tendencies in the service of which these errors may be employed. What is common to all the cases is the wish to lose something; what varies is the reason for this wish and the aim in them. One loses something if it has become damaged, if one has an impulse to replace it with a better, if one has ceased to care for it, if it came from someone with whom one's relations have become strained, or if it was acquired in circumstances that one no longer wishes to think of.

Letting things fall, smashing or breaking them serves the same tendency. In social life it is said that unwelcome and illegitimate children are found to be far more often weakly than those conceived in happier circumstances. This result does not imply that the crude methods of the so-called baby farmers have been employed; some degree of carelessness in the supervision of the child would be quite sufficient. The preservation, or otherwise, of objects may well follow the same lines as that of children.

Then too it may happen that things will become destined to be lost without losing their worth—that is, when there is an impulse to sacrifice something to fate in order to avert some other dreaded loss. According to the findings of analysis such conjurations of fate are still very common among us, so that our losses are often voluntary sacrifices. Losing may equally well serve the impulses of spite or of self-punishment; in short, the more remote forms of motivation behind the impulse to do away with something by losing cannot easily be exhausted.

Mislaying of objects, or erroneous performance of actions, like other errors, is often made use of to fulfil a wish which should be denied; the intention masquerades as lucky chance. Thus, as once happened to a friend, one has to take a train, most unwillingly, in order to pay a visit in the suburbs and then, in changing trains at a connection, gets by mistake into one which is returning to town; or on a journey someone might greatly like to make a halt at some stopping-place which cannot be done owing to fixed engagements elsewhere, whereupon he mistakes or misses the connection, so that the desired delay is forced upon him. Or as happened to one of my patients whom I had forbidden to telephone to the lady he was in love with, he by mistake and thoughtlessly gave the wrong number when he meant to telephone to me so that he was suddenly connected with her. The following account by an engineer is a pretty example of the conditions under which damage to material objects may be done and also demonstrates the practical significance of directly faulty actions.

Some time ago I worked with several colleagues in the laboratory of a High School on a series of complicated experiments in elasticity, a piece of work we had undertaken voluntarily; it was beginning to take up more time however than we had anticipated. One day as I went into the laboratory with my friend F. he remarked how annoying it was to him to lose so much time today as he had so much to do at home. I could not help agreeing with him and said half jokingly, referring to an occasion the week before: 'Let us hope the machine will break down again so that we can stop work and go home early.' In arranging the work it happened that F. was given the regulation of the valve of the press, that is to say he was, by carefully opening the valve, to let the liquid pressure out of the accumulator slowly into the cylinder of the hydraulic press. The man who was conducting the experiment stood by the pressure gauge and, when the right pressure was reached, called out loudly 'Stop.' At this command F. seized the valve and turned with all his might—to the left (All valves without exception close to the right.) Thereby the whole pressure in the accumulator suddenly came upon the press, a strain for which the connecting pipes are not designed, so that one of them instantly burst—quite a harmless accident, but one which forced us, nevertheless, to cease work for the day and go home. It is characteristic, by the way, that not long after when we were discussing the affair my friend F. had no recollection whatever of my remark, which I recalled with certainty.

So with this in mind you may begin to suspect that it is not always mere chance which makes the hands of your servants such dangerous enemies to your household effects. And you may also raise the question whether it is always an accident when one injures oneself or exposes oneself to danger—ideas which you may put to the test by analysis when you have an opportunity.

This is far from being all that could be said about errors. There is still much to be enquired into and discussed. But I shall be satisfied if you have been shaken somewhat in your previous belief by our investigations, so far as

they have gone and if you have gained a certain readiness to accept new ones For the rest I must be content to leave you with certain problems still unsolved We cannot prove all our principles by the study of errors nor are we indeed by any means solely dependent on this material The great value of errors for our purpose lies in this that they are such common occurrences may easily be observed in oneself and are not at all contingent upon illness I should like to mention one more of your unanswered questions before concluding If as we see from so many examples people come so close to understanding errors and o often act as if they perceived their meaning how is it possible that they should so generally consider them accidental sen eless and meaningless and so energetically oppose the psycho-analytic explanation of them?

You are right this is indeed striking and requires an explanation But I will not give it to you I will rather guide you slowly towards the connections by which the explanation will be forced upon you without any aid from me.

PART II DREAMS

FIFTH LECTURE

DIFFICULTIES AND PRELIMINARY APPROACH TO THE SUBJECT

ONE day the discovery was made that the symptoms of disease in certain nervous patients have meaning It was upon this discovery that the psycho analytic method of treatment was based In this treatment it happened that patients in speaking of their symptoms also mentioned their dreams whereupon the suspicion arose that these dreams too had meaning

However we will not pursue this historical path but will strike off in the opposite direction Our aim is to demonstrate the meaning of dreams in preparation for the study of the neuroses There are good grounds for this reversal of procedure since the study of dreams is not merely the best preparation for that of the neuroses but a dream is itself a neurotic symptom and moreover one which possesses for us the incalculable advantage of occurring in all healthy people Indeed if all human beings were healthy and would only dream we could gather almost all the knowledge from their dreams which we have gained from studying the neuroses

So dreams become the object of psycho analytic research—another of these ordinary under rated occurrences apparently of no practical value like *errors* and sharing with them the characteristic of occurring in healthy persons But in other respects the conditions of work are rather less favourable Errors had only been neglected by science people had not troubled their heads much about them but at least it was no di race to occupy oneself with them True people said there are things more important but still something may possibly come of it To occupy oneself with dreams however is not merely unpractical and superfluous but positively scandalous it carries with it the taint of the unscientific and arouses the suspicion of personal leanings towards mysticism The idea of a medical student troubling himself about dreams when there is so much in neuropathology and psychiatry itself that is more serious—tumours as large as apples compressing the organ of the mind haemorrhages chronic inflammatory conditions in which the alterations in the tissues can be demonstrated under the microscope! No dreams are far too unworthy and trivial to be objects of scientific research

There is yet another factor involved which in itself sets at defiance all the requirements of exact investigation In investigating dreams even the object of research the dream itself is indefinite A delusion for example pre ents clear and definite outlines I am the Emperor of China says your patient plainly But a dream? For the most part it cannot be related at all When a man tells a dream has he any guarantee that he has told it correctly and not perhaps altered it in the telling or been forced h rrueress ot be ot for

By J seph B eu r i th y a 88 88 Cf my lect e Psych A aly d l d the U ted St tes 9 9 [*Th O g d D l pment* *Psycho-A aly s* se p 1 ho e]

some tiny fragments. And is a scientific psychology or a method of treatment for the sick to be founded upon material such as this?

A certain elem t of exaggerat in a criticism may arouse o r suspicio s. The arguments brou ht against the dream as an object of scientific research are clea ly extreme We have met with the objection of tri alty already in errors, and ha e told ourselves that great things may be revealed even by small ind ca tions. As t the indistinctness of dreams, that is a characteristic like any other—we cannot dictate to things their characteristics besides, there are also dreams which are clea and well d fined. Furthe there are othe objects of psy hiatric investigation which suffer in the same way from the qual ty of indefiniteness e.g th obsess ve deas of many cases, with which nevertheless many psychiatrists of repute and standing ha e occupied themselves. I will recall th last case of the kind which came before me in medical practice. The patient, a woman, presented her case in these words "I have a certain f eling as if I had injured or had meant to injure, some living creature—pe haps a child—no no a dog rather as if perhaps I had pushed it off a bridge—or don som thing else. Any disadvantage resulting from the uncertain recollection of dreams may be rem died by deciding that exactly what the dreamer tells is to count as the dream, and by ignoring all that he may ha e f rg tten o altered in the process of recollecti Finally o e cannot maintain in so sweeping a f shion that dreams are unimportant things We know from our own experi nce that th mood in which we awake from a dream may been disor which furth

impulse to moment s deeds sprang from the dreams. W may therefore a k What is the real cause of the disdain in which dreams re held in scientific circles? In my pini n t is the reactio from the over-estimation of them in earli times It is well known that t is no easy matter to reconstruct the past but w may a sume with certainty (you will forgi e my jest) that as early as three thousand years ago and more ur ancestors dreamt in th sam way as w do So far as we know all a cient peop es ttached gr t s gnificance t dreams a d r gard d them as of pract cal alu they obtained from them a guries of the future and looked for portents in them For the Greeks and other Orientals it was at times as un th nkable to undertake a campaign without a dream interpreter as it would be today without air scouts for intelligence When Alexander the Great set out on his campaign of co quest the

d ring the siege then one night he dreamed of a satyr dancing in triumph and when he related this dream to his interpreters they informed him that it foretold his victory over the city he gave the order to attack and took Tyre by storm Among the Etruscans and Romans other methods of foretelli g the future were employed, but during the whole of the Græco-Roman period the interpretation of dreams was practiced and held in high esteem Of h

H drian How t happened that the art of d eam int rpretation declined later and dreams

ages things fa more absurd than the ancient practice of the interpretation of dreams were faithfully retained. The fact remains that the interest in dreams gradually sank to the level of superstition and could hold its own only amo gst th uneducated In our day there survive as a final degradat on of the art of dream

scien e of the present day has repeatedly concerned itself with the d eam but always with the sole object of illu trat ng *physiolog cal* theories By med cal men naturally a dream was never regarded as a mental process but as the mental express on of phys cal st muli. Binz in 1876 p onounced th d eam to be a physical process always useless and in many cases actually mo b d a process above which the conceptio of the world-soul and of immortal ty stands as high as does the blue ky above th most low lyin weed grown stretch of sand Maury compa es dreams with th spasmodic jerki gs of St V tus da c co trasted with the co-ordinated moveme ts of th n rmal human being in an old omparison parall l is drawn between the content of a dream and

the sounds which would be produced if some one ignorant of music let his ten fingers wander over the keys of an instrument

Interpretation means discovering a hidden meaning but there can be no question of attempting this while such an attitude is maintained towards the dream performance Look up the description of dreams given in the writings of Wundt Jodl and other recent philosophers they are content with the bare enumeration of the divergences of the dream life from waking thought with a view to depreciating the dreams they emphasize the lack of connection in the associations the suspended exercise of the critical faculty the elimination of all knowledge and other indications of diminished functioning The single valuable contribution to our knowledge about dreams for which we are indebted to exact science relates to the influence upon the dream content of physical stimuli operating during sleep We have the work of a Norwegian author who died recently—J Mourly Vold—two large volumes on experimental investigation of dreams (translated into German in 1910 and 1912) which are concerned almost entirely with the results obtained by change in the position of the limbs These investi ations have been held up to us as models of exact research in the subject of dreams Now can you imagine what would be the comment of exact science on learning that we intend to try to find out the *meaning* of dreams? The comment that has perhaps been made already! However we will not allow ourselves to be appalled at the thought If it was possible for errors to have an underlying meaning it is possible that dreams have one too and errors have in very many cases a meaning which has eluded the researches of exact science Let us adopt the assumption of the ancients and of simple folk and follow in the footsteps of the dream interpreters of old

First of all we must take our bearings in this enterprise and make a survey of the field of dreams What exactly is a dream? It is difficult to define it in a single phrase Yet we need not seek after a definition when all we need is to refer to something familiar to every one Still we ought to pick out the essential features in dreams How are we to discover these features? The boundaries of the region we are entering comprise such vast differences differences whichever way we turn That which we can show to be common to all dreams is probably what is essential

Well then—the first common characteristic of all dreams would be that we are asleep at the time Obviously the dream is the life of the mind during sleep a life bearing certain resemblances to our wakin life and at the same time differing from it widely That indeed was Aristotle s definition Perhaps dream and sleep stand in yet closer relationship to each other We can be waked by a dream we often have a dream when we wake spontaneously or when we are forcibly rou ed from sleep Dreams seem thus to be an intermediate condition between sleeping and waking Hence our attention is directed to sleep itself what then is sleep?

That is a physiological or biological problem concerning which much is still in dispute We can come to no decisive answer but I think we may attempt to define one psychological characteristic of sleep Sleep is a condition in which I refuse to have anything to do with the outer world and have withdrawn my interest from it I go to sleep by retreating from the outside world and warding off the stimuli proceeding from it Again when I am tired by that world I go to sleep I say to it as I fall asleep Leave me in peace for I want to sleep The child says just the opposite I won t go to sleep yet I m not tired I want more things to happen to me! Thus the biological object of sleep seems to be recuperation its psycholo ical characteristic the suspension of interest in the outer world Our relationship with the world which we entered so unwillingly seems to be endurable only with intermission hence we withdraw again periodically into the condition prior to our entrance into the world that is to say into intra uterine existence At any rate we try to bring about quite similar conditions—warmth darkness and absence of stimulus—characteristic of that state Some of us still roll ourselves tightly up into a ball resembling the intra uterine position It looks as if we grown ups do not belong wholly to the world but only by two thirds one third of us has never yet been born at all Every time we wake in the morning it is as if we were newly born We do in fact speak of the condition of waking from sleep in these very words we feel as if we were newly born —and in this we are probably quite mistaken in our idea of the general en sations of the new born infant it may be assumed on the contrary that it feels extremely uncomfortable Again in speaking of birth we speak of seeing the light of day

If this is the nature of sleep then dreams do not come into its scheme at all but seem rather

to be an unwelcome supplement to it and we do indeed believe that dreamless sleep is the best, th only proper sleep There sho ld be no mental activity durin g leep if any such activity besturs itself then in so far ha e we f ed to reach the true pre natal cond tion of peace we have no been abl to avo d al o gether some remnan s of mental act ty and the act f dreaming would represent these remnants. In that event t really does seem tha dreams do ot eed t have meaning W th errors it was different, f r they were at least ctn ues manifested in waki g l fe but if I leep a d have al og ther suspended mental activity with the except n of certain remnant which I have no bee b e to suppre there is no neces whateve that they s ould have an mean n I f ct I cannot even make use of any s ch meanin seeing that the rest of my mind is a leep It can really t en be a m ter f pasmodi re ct only of uch mental phen mena nly a ha e the r rect t phys cal stimulation Hence dreams must be remnants f th mental acti ity of waking life d urbing leep and we mi ht as well make up our minds forthwith to band n a theme so unsuited to the purposes of psycho-analysis.

Superf ous as dreams may be however they do ex t evertheless and we can try to account f their ex tence t o rselves. Why does t mental lif g ff to sleep? Probably because there is om hing that will not lea e the mind in peace timuli are tin upon it a d to these t is bound to react Dreams there fore are the mod of react o f t e mind t stim ' cting upo t durin leep W o e here pos ibility of ac ess to comprehension of dreams W can ow endea our t find out in various dreams, what re the timuli seeki g t disturb sleep the reaction to whi h takes the f rm f dreams By doing this we ould have worked out t first characteristic common to all dreams.

Is there any other comm characteristic? Yes, there is another unmistakabl and yet m h harder to lay hold f and describe The character f mental processes during leep is quite diff rent from that f waking p oces es In dreams we go through many experien es which we fully bel eve in, wh reas in eality we are perhaps only experiencing the ingl disturbing timulus For the mo t part our ex perien es tak the form f isual images there may be feeli g as well thou hts too mixed up with th m and the the senses ma be drawn in but fo th most part dreams consist of visual images Part of the d fficulty of re cit , a dream comes from the fact tha we ha e to tran late these images into words. I could draw t the dreamer often a s to us but I do not know how to put it in o words N w th s is not exactly a dim u ion in the mental capacity as seen in a contrast between a feeb e minded person a d a man of genius. The di erence is rather a qualitati e one but it is difficult to sa precisely wherein it l es G T Fechner once s es ed that the age whereo the drama of the dream (within the mind) is p a ed out is other than that of the

most dreams make upon us. Again the com parison of the act of dreami with the per f rmances of an unskilled hand in music breaks down here for the piano will certai ly respond with the same notes thou h not w th melod es t a chance touch on its keys. We will keep this second common characteristic of dreams carefull in view even though we may not u derstand it.

Are there an other qual ties common to all dreams? I can th k of none but can see differ ences o ly whi hever way I look, d erences too in every respect—in apparent durat on defin teness the part played by affects persist ence in the mind and so forth. This s really n t what we should naturally expect in the case of a compulsive att mpt, at o ce m acre and spa modic t ward ff a timulus. As regards *the length of dreams* ome are ery bort, con taining onl o image or ery few or a n le thought, possibly even a ingle wo d others are peculiarly rich in co tent enact en ire romances and eem to last a ery long time There re dreams as dis ct as actual experi ences so d stinct that for some time after wakin we d ot realize that they were dreams at all oth rs which t ineff bly f int hadowy and bl rred in on and the same dream even, there may be some parts of extra rdinary ividnes alt rnating with others so indi tinct as to be almost who ly el e Again dreams may be quite cons tent o at an rate coherent o even witty or fantas cally beauti ful hers again are confused apparently imbecile absurd o often absolut ly m d Th re are dreams which lea e us qu te cold others in which every affect makes tself f l —pain to th point of tears, terr intense to wake us amazement d light and n. Most

the sounds which would be produced if some one ignorant of music let his ten fingers wander over the keys of an instrument

Interpretation means discovering a hidden meaning but there can be no question of attempting this while such an attitude is maintained towards the dream performance Look up the description of dreams given in the writings of Wundt Jodl and other recent philosophers they are content with the bare enumeration of the divergences of the dream life from waking thou ht with a view to depreciating the dreams they emphasize the lack of connection in the associations the suspended exercise of the critical faculty the elimination of all knowledge and other indications of diminished functioning The single valuable contribution to our knowledge about dreams for which we are indebted to exact science relates to the influence upon the dream content of physical stimuli operating during sleep We have the work of a Norwegian author who died recently—J Mourly Vold—two large volumes on experimental investigation of dreams (translated into German in 1910 and 1912) which are concerned almost entirely with the results obtained by change in the position of the limbs These investigations have been held up to us as models of exact research in the subject of dreams Now can you imagine what would be the comment of exact science on learning that we intend to try to find out the *meaning* of dreams? The comment that has perhaps been made already! However we will not allow ourselves to be appalled at the thought If it was possible for errors to have an underlying meaning it is possible that dreams have one too and errors have in very many cases a meaning which has eluded the researches of exact science Let us adopt the assumption of the ancients and of simple folk and follow in the footsteps of the dream interpreters of old

First of all we must take our bearings in this enterprise and make a survey of the field of dreams What exactly is a dream? It is difficult to define it in a single phrase Yet we need not seek after a definition when all we need is to refer to something familiar to every one Still we ought to pick out the essential features in dreams How are we to discover these features? The boundaries of the region we are entering comprise such vast differences differences whichever way we turn That which we can show to be common to all dreams is probably what is essential

Well then—the first common characteristic of all dreams would be that we are asleep at the time Obviously the dream is the life of the mind during sleep a life bearing certain resemblances to our wakin life and at the same time differin from it widely That in deed was Aristotle s definition Perhaps dream and sleep stand in yet closer relationship to each other We can be waked by a dream we often have a dream when we wake spontaneously or when we are forcibly roused from sleep Dreams seem thus to be an intermediate condition between sleeping and waking Hence our attention is directed to sleep itself what then is sleep?

That is a physiological or biological problem concerning which much is still in dispute We can come to no decisive answer but I think we may attempt to define one psychological characteristic of sleep Sleep is a condition in which I refuse to have anything to do with the outer world and have withdrawn my interest from it I go to sleep by retreating from the outside world and warding off the stimuli proceeding from it Again when I am tired by that world I go to sleep I say to it as I fall asleep Leave me in peace for I want to sleep The child says just the opposite I won t go to sleep yet I m not tired I want more things to happen to me! Thus the biological object of sleep seems to be recuperation its psychological characteristic the suspension of interest in the outer world Our relationship with the world which we entered so unwillingly seems to be endurable only with intermission hence we withdraw a ain periodically into the condition prior to our entrance into the world that is to say into intra uterine existence At any rate we try to bring about quite similar conditions—warmth darkness and absence of stimulus—characteristic of that state Some of us still roll ourselves tightly up into a ball resembling the intra uterine position It looks as if we grown ups do not belong wholly to the world but only by two thirds one third of us has never yet been born at all Every time we wake in the morning it is as if we were newly born We do in fact speak of the condition of waking from sleep in these very words we feel as if we were newly born —and in this we are probably quite mistaken in our idea of the general sensations of the new born infant it may be assumed on the contrary that it feels extremely uncomfortable Again in speaking of birth we speak of seeing the light of day

If this is the nature of sleep then dreams do not come into its scheme at all but seem rather

chins in that way and so on meanwhile I follow her as she goes with anxious looks. I think so—the next thing is a stumble on the threshold, the crockery falls crashing and clattering in a hundred pieces on the ground. But—I soon become aware that that interminably prolonged sound is no real crash, but a regular ringing,—and this ringing is due merely to the alarm-clock, as I realize at last on awakening.

These dreams are very pretty perfectly sensible and by no means so incoherent as dreams usually are. We have no quarrel with them on those grounds. The thing common to them all is that in each case the situation arises from a noise which the dreamer on waking recognizes as that of the alarm-clock. Hence we see here how a dream is produced, but we find out something more In the dream there is no recognition of the clock, which does not even appear in it but for the noise of the clock another noise is substituted the stimulus which disturbs sleep is interpreted, but interpreted differently in each instance Now why is this? There is no answer it appears to be mere caprice. But to understand the dream we should be able to account for its choice of just this noise and no other to interpret the stimulus given by the alarm-clock. In analogous fashion we must object to Maury's experiments that although it is clear that the stimulus brought to bear on the sleeper does appear in the dream, yet his experiments don't explain why it appears exactly in this form, which is one that does not seem explicable by the nature of the stimulus disturbing sleep And further in Maury's experiments there was mostly a mass of other dream-material attached to the direct result of the stimulus for example the crazy adventures in the eau de Cologne dream, for which we are at a loss to account.

Now will you reflect that the class of dreams which wake one up affords the best opportunity for establishing the influence of external disturbing stimuli. In most other cases it will be more difficult We do not wake up out of all dreams and if in the morning we remember a dream of the night before how are we to assign it to a disturbing stimulus operating perhaps during the night I once succeeded in subsequently establishing the occurrence of a sound-stimulus of this sort, but only of course because of peculiar circumstances I woke up one morning at a place in the Tyrolese mountains knowing that I had dreamt that the Pope was dead. I could not explain the dream to [illegible] and chapels? [illegible] sleep is too sound, but thanks to her telling me this I understood my dream How often may such causes of stimulus as this induce dreams in the sleeper without his ever hearing of them afterwards? Possibly very often and possibly not If we can get no information of any stimulus we cannot be convinced on the point. And apart from this we have given up trying to arrive at an estimation of the sleep-disturbing external stimuli since we know that they *only* explain a fragment of the dream and not the whole dream-reaction.

We need not on that account give up this theory altogether there is still another possible way of following it out. Obviously it is a matter of indifference what disturbs sleep and causes the mind to dream. If it cannot always be something external acting as a stimulus to one of the senses it is possible that, instead a stimulus operates from the internal organs—a so-called somatic stimulus. This supposition lies very close and moreover corresponds to the view popularly held with regard to the origin of dreams for it is a common saying that they come from the stomach. Unfortunately here again we must suppose that in very many cases information respecting somatic stimulus operating during the night would no longer be forthcoming after waking so that it would be *incapable of proof* But we will not overlook the fact that many trustworthy experiences support the idea that dreams may be derived from somatic stimuli on the whole it is indubitable that the condition of the internal organs can influence dreams The relation of the content of many dreams to distention of the bladder or to a condition of excitation of the sex-organs is so plain that it cannot be mistaken. From these obvious cases we pass to others in which to judge by the content of the dream, we are at least justified in suspecting that some such somatic stimuli have been at work, since there is something in this content which can be regarded as elaboration representation, or interpretation of these stimuli. Scherner the investigator of dreams (1861) emphatically supported the view which traces the origin of dreams to organic stimuli, and contributed some excellent examples towards it. For instance he sees in a dream two rows of beautiful boys with fair hair and delicate complexions confronting each other

dreams are forgotten soon after waking or they persist throughout the day the recollection becoming fainter and more imperfect as the day goes on others remain so vivid (as for example the dreams of childhood) that thirty years later we remember them as clearly as though they were part of a recent experience Dreams like people may make their appearance once and never come back or the same person may dream the same thing repeatedly either in the same form or with slight alterations In short these scraps of mental activity at night time have at command an immense repertory can in fact create everything that by day the mind is capable of—only it is never the same

One might attempt to account for these diversities in dream by assuming that they correspond to different intermediate states between sleeping and waking different levels of imperfect sleep Very well but then in proportion as the mind approached the waking state there should be not merely an increase in the value content and distinctness of the dream performance but also a growing perception that it *is* a dream and it ought not to happen that side by side with a clear and sensible element in the dream there is one which is nonsensical or indistinct followed again by a good piece of work It is certain that the mind could not vary its depth of sleep so rapidly as that This explanation therefore does not help there is in fact no short cut to an answer

For the present we will leave the *meaning* of the dream out of question and try instead by starting from the common element in dreams to clear a path to a better understanding of their nature From the relationship of dreams to sleep we have drawn the conclusion that dreams are the reaction to a stimulus disturbing sleep As we have heard this is also the single point at which exact experimental psychology can come to our aid it affords proof of the fact that stimuli brought to bear durin sleep make their appearance in dreams Many investigations have been made on these lines culminating in those of Mourly Vold whom I mentioned earlier we have all too been in a position to confirm their results by occasional observations of our own I will choose some of the earlier experiments to tell you Maury had tests of this kind carried out on himself Whilst dreaming he was made to smell some eau de Cologne whereupon he dreamt he was in Cairo in the shop of Johann Maria Farina and this was followed by some crazy adventures Again someone gave his neck a gentle pinch and he dreamt of the application of a blister and of a doctor who had treated him when he was a child Again they let a drop of water fall on his forehead and he was immediately in Italy perspiring freely and drinking the white wine of Orvieto

The striking feature about these dreams produced under experimental conditions will perhaps become still clearer to us in another series of *stimulus* dreams These are three dreams of which we have an account by a clever observer Hildebrandt and all three are reactions to the sound of an alarm clock

I am going for a walk on a sprin morning and I saunter throu h field just beginning to grow green till I come to a neighbouring village where I ee the inhabitants in holiday attire making their way in large numbers to the church their hymn books in their hands Of course! it is Sunday and the mornin ervice is just about to begin I decide to take part in it but first as I am rather overheated I think I will cool down in the churchyard which surrounds the church Whilst reading some of the epitaphs there I hear the bell ringer go up into the tower where I now notice high up the little village bell which will give the signal for the beginning of the service For some time yet it remains motionless then it begins to swing and suddenly the strokes ring out clear and piercing—so clear and piercing that they put an end to my sleep But the sound of the bell comes from the alarm clock

Here is another combination of images It is a bright winter day and the roads are deep in snow I have promised to take part in a sleighing expedition but I have to wait a long time before I am told that the sleigh is at the door Now follow the preparations for getting in the fur rug is spread out and the foot muff fetched and finally I am in my place But there is still a delay while the horses wait for the signal to start Then the reins are jerked and the little bells shaken violently begin their familiar janizary music so loudly that in a moment the web of the dream is rent Again it is nothing but the shrill of the alarm clock

Now for the third example! I ee a kitchen maid with dozens of piled up plates goin along the passage to the d ning room It seems to me that the pyramid of china in her arms is in dan er of overbalancing I call out a warning Take care your whole load will fall to the ground Of course I receive the usual answer that they are accustomed to carrying

that is quite plain we want to know further from what cau e and to what end we repeat in dreams thi which is known to us and has rec ntly happened to us

I think y u would be as t red as I of con tinui g th k nd of attempts we ha e m de up to this point It only shows that all the interest in the world will n t h lp us w th problem unless we ha also an dea of some path t adopt in o d r to arri e at a solutio Till now we ha e t found thi p th Experimental psy chology has co t b ted n thing but s m (c r tainly ery valuabl) informat on about the significance of timuli in the p odu t on of dreams Of phil sophy we ha e nothing to ex pect unless t be lofty repetition of the re-proach that our bj ct intellectually con temptible whil from the occult c ences we su ely d t choose t borr w Hi tory and th v dict f the people tell us that dreams re f ll of mean g and mporta e nd of prophetic signifi ance but that s ha d to ac cept a d certa ly does not lend tself to p oof So th our first endea ours a e completely baffled.

The

pugnaciously joining in combat seizing hold of one another and again letting go their hold only to take up the former position and go through the whole process again his interpretation of the two rows of boys as the teeth is in itself plausible and seems to receive full confirmation when after this scene the dreamer pulls a long tooth from his jaw Again the interpretation of long narrow winding passages as being su gested by a stimulus originating in the intestine seems sound and corroborates Scherner s assertion that dreams primarily endeavour to repre ent by like objects the organ from which the stimulus proceeds

We must therefore be prepared to admit that internal stimuli can play the same role in dreams as external ones Unfortunately evaluation of this factor is open to the same objections In a great number of instances the attribution of dreams to somatic stimuli must remain uncertain or incapable of proof not all dreams but only a certain number of them rouse the suspicion that stimuli from internal organs have something to do with their origin and lastly the internal somatic stimulus will suffice no more than the external sensory stimulus to explain any other part of the dream than the direct reaction to it The origin of all the rest of the dream remains obscure

Now however let us direct our attention to a certain peculiarity of the dream life which appears when we study the operation of these stimuli The dream does not merely reproduce the stimulus but elaborates it plays upon it fits it into a context or replaces it by something else This is a side of the dream work which is bound to be of interest to us because possibly it may lead us nearer to the true nature of dreams The scope of a man s production is not necessarily limited to the circumstance which immediately gives rise to it For instance Shakespeare s *Macbeth* was written as an occasional drama on the accession of the king who first united in his person the crowns of the three kingdoms But does this historical occasion cover the whole content of the drama or explain its grandeur and its mystery? Perhaps in the same way the external and internal stimuli operating upon the sleeper are merely the occasion of the dream and afford us no insight into its true nature

The other element common to all dreams their peculiarity in mental life is on the one hand very difficult to grasp and on the other eems to afford no clue for further inquiry Our experiences in dreams for the most part take the form of visual ima es Can these be explained by the stimuli? Is it really the stimulus that we experience? If so why is the experience visual when it can only be in the very rarest instance that any stimulus has operated upon our eyesi ht? Or can it be shown that when we dream of speech any conversation or sounds resembling conversation reached our ears during sleep? I venture to discard such a possibility without any hesitation whatever

If we cannot get any further with the common characteristics of dreams as a starting point let us try beginning with their differences Dreams are often meaningless confused and absurd yet there are some which are sensible sober and reasonable Let us see whether these latter sensible dreams can help to elucidate those which are meaningless I will tell you the latest reasonable dream which was told to me the dream of a young man I went for a walk in the Karntnerstrasse and there I met Mr X after accompanying him for a short time I went into a restaurant Two ladies and a gentleman came and sat down at my table At first I was annoyed and refused to look at them but pre ently I glanced across at them and found that they were quite nice The dreamer s comment on this was that the evening before he had actually been walking in the Karntnerstrasse which is the way he usually goes and that he had met Mr X there The other part of the dream was not a direct reminiscence but only bore a certain resemblance to an occurrence of some time previously Or here we have another prosaic dream that of a lady Her husband says to her Don t you think we ought to have the piano tuned? and she replies It is not worth it for the hammers need fresh leather anyhow This dream repeats a conversation which took place in almost the same words between herself and her husband the day before the dream What then do we learn from these two prosaic dreams? Merely that there occur in them recollections of daily life or of matters connected with it Even that would be something if it could be as erted of all dreams without exception But that is out of the question this characteristic too belongs only to a minority of dreams In most dreams we find no connection with the day before and no light is thrown from this quarter upon meaningless and absurd dreams All we know is that we have met with a new problem Not only do we want to know what a dream is saying but if as in our examples

that is quite plain, we want to know further from what cause and to what end we repeat in dreams this which is known to us and has recently happened to us.

I think you would be as tired as I of continuing this kind of attempts we have made up to this point. It only shows that all the interest in the world will not help us with a problem unless we have also an idea of some path to adopt in order to arrive at a solution. Till now we have not found this path. Experimental psychology has contributed nothing but some (certainly very valuable) information about the significance of stimuli in the production of dreams. Of philosophy we have nothing to expect, unless it be a lofty repetition of the reproach that our object is intellectually contemptible; while from the occult sciences we surely do not choose to borrow. History and the verdict of the people tell us that dreams are full of meaning and importance and of prophetic significance; but that is hard to accept and certainly does not lend itself to proof. So then our first endeavours are completely baffled.

But unexpectedly there comes a hint from a direction in which we have not hitherto looked. Colloquial speech, which is certainly no matter of chance but the deposit, as it were, of ancient knowledge—a thing which must not indeed be made too much of—our speech, I say recognizes the existence of something to which, strangely enough, it gives the name of *day-dreams*. Day-dreams are phantasies (products of phantasy); they are very common phenomena, are observable in healthy as well as in sick persons, and they also can easily be studied by the subject himself. The most striking thing about these 'phantastic' creations is that they have received the name of '*day-dreams*', for they have nothing in common with the two universal characteristics of dreams. Their name contradicts any relationship to the condition of sleep and, as regards the second universal characteristic, experience or hallucination takes place in them; we simply imagine something; we recognize that they are the work of phantasy; that we are not seeing but thinking. These day-dreams appear before puberty, often indeed in late childhood, and persist until maturity is reached, when they are either given up or retained as long as life lasts. The content of these phantasies is dictated by a very transparent motivation. They are scenes and events which gratify either the egoistic cravings of ambition and thirst for power or the erotic desires of the subject. In young men ambitious phantasies predominate; in women, whose ambition centres on success in love, erotic phantasies; but the erotic requirement can often enough in men too be detected in the background: all their heroic deeds and successes are really only intended to win the admiration and favour of women. In other respects these day-dreams show great diversity and their fate varies. All of them are either given up after a short time and replaced by a new one or retained, spun out into long stories and adapted to changes in circumstances in life. They march with the times and they receive as it were date-stamps upon them which show the influence of new situations. They form the raw material of poetic production, for the writer by transforming, disguising or curtailing them creates out of his day-dreams the situations which he embodies in his stories, novels and dramas. The hero of a day-dream is, however, always the subject himself, either directly imagined in the part or transparently identified with someone else.

Perhaps day-dreams are so called on account of their similar relation to reality, as an indication that their content is no more to be accepted as real than is that of dreams. But it is possible that they share the name of dreams because of some mental characteristic of the dream which we do not yet know but after which we are seeking. On the other hand it is possible that we are altogether wrong in regarding this similarity of name as significant. That is a question which can only be answered later.

SIXTH LECTURE

PRELIMINARY HYPOTHESES AND TECHNIQUE OF INTERPRETATION

WE THUS realize our need of a new way of approach, a definite method, if we are to make any advance in our researches into dreams. I will now offer an obvious suggestion: let us accept as the basis of the whole of our further enquiry the following hypothesis—that dreams are not a somatic but a mental phenomenon. You know what this means, but what is our justification in making this assumption? We have none; but on the other hand there is nothing to prevent us. The position is this: if the dream is a somatic phenomenon it does not concern us; it can only be of interest to us on the hypothesis that it is a mental phenomenon. So we will assume that this hypothesis is true in order to see what happens if we do so. The

results of our work will determine whether we may adhere to the assumption and uphold it in its turn as an inference fairly drawn Now what exactly is the object of this enquiry of ours or to what are we directin our efforts? Our object is that of all scientific endeavour—namely to achieve an understanding of the phenomena to establish a connection between them and in the last resort wherever it is pos sible to increase our power over them

So we continue our work on the assumption that dreams are a mental phenomenon In that event they are a performance and an utterance on the part of the dreamer but of a kind that conveys nothin to us and which we do not understand Now supposing that I give utter ance to something that you do not understand what do you do? You ask me to explain do you not? Why may not we do the ame—*ask the dreamer the meaning of the dream?*

Remember we have already found ourselves in a similar position It was when we were en quirin into certain errors and the instance we took was a slip of the ton ue Someone had said Then certain things were *re filled* and thereupon we asked—no fortunately it was not *we* who asked but other people who had noth ing to do with psycho analysis—*they* asked what he meant by this enigmatic expression He answered at once that what he had intended to say was That was a filthy business but had checked himself and substituted the milder words Things were revealed there I ex plained to you then that this enquiry was the model for every psycho analytic investigation and you understand now that psycho analytic technique endeavours as far as possible to let the persons being analysed give the answer to their own problems The dreamer himself then should interpret his dream for us

That is not so simple with dreams however as we all know Where errors were concerned this method proved possible in many cases there were others where the person questioned refused to say anything and even indignantly repudiated the answer su gested to him With dreams instances of the first type are entirely lacking the dreamer always says he knows nothing about it He cannot very well repudiate our interpretation since we have none to offer him Shall we have to give up our attempt then? Since *he* knows nothing and *we* know nothing and a third person can surely know

k h pect of
up the
ou can

accompany me For I assure you that it is not only quite possible but highly probab e, that the dreamer really does know the mean ing of his dream *only he does not know th he knows and therefore thinks that he does not*

At this point you will probably call my at tention to the fact that I am a ain introducing an assumption the second in quite a short con text and that by so doing I greatly detract from the force of my claim to a trustworthy method of procedure Given the hypothesis that dreams are a mental phenomenon and given further the hypothesis that there are in the minds of men certain things which they know without knowing that they know th m—and so forth! You have only to keep in view the intrinsic improbability of both these hy potheses and you may with an easy mind aban don all interest in the conclusions to be drawn from them

Well I have not brou ht you here either to delude you or to conceal anything from you True I announced that I would give a course of lectures entitled Introductory Lectures on Psycho analysis but it was no part of my purpose to play the oracle professing to show you an easy sequence of facts whilst carefully concealing all difficulties filling up gaps and glossing over doubtful points so that you mi ht comfortably enjoy the belief that you have learnt something new No it is the very fact that you are beginners that makes me anxious to show you our science as it is with all its ex crescences and crudities the claims that it makes and the criticism to which it may give rise I know indeed that it is the same in every science and that especially in the beginnings it cannot be otherwise I know too that in teaching other sciences an effort is made at first to hide these difficulties and imperfections from the learner But that cannot be done in psycho analysis So I really have set up two hypotheses the one within the other and any one who finds it all too laborious or too uncer tain or who is used to higher degrees of cer tainty or to more refined deductions need go no further with me Only I should advi e him to leave psychological problems altogether alone for it is to be feared that this is a field in which he will find no access to such exact and sure paths as he is prepared to tread And fur ther it is quite superfluous for any science which can offer a real contribution to knowl edge to strive to make itself heard and to win adherents Its reception must depend upon its

results, and it can afford to wait until these have compelled attention.

But I may warn those of you who are not to be deterred in this way that my two assumptions are not of equal importance. The first, that dreams are a mental phenomenon, is the hypothesis which we hope to prove by the results of our work. The second has already been proved in a different field, and I am merely taking the liberty of transferring it thence to our problems.

Where, and in what connection, is it supposed to have been proved that a man can possess knowledge without knowing that he does so, which is the assumption we are making of the dreamer. Surely that would be a remarkable and surprising fact, which would change our conception of mental life and would have no need of concealment. Incidentally it would be a fact belied in the very statement of it, which yet intends to be literally true—a contradiction in terms. There is no, however, any attempt at concealment. We cannot blame the fact for people's ignorance of it or lack of interest in it any more than we ourselves are to blame because all these psychological problems have been passed in judgment by persons who have held aloof from all the observations and experiments which alone can be conclusive.

The proof to which I refer was found in the sphere of hypnotic phenomena. In the year 1889 I was present at the remarkably impressive demonstrations by Liébault and Bernheim, in Nancy and there I witnessed the following experiment. A man was placed in a condition of somnambulism, and then made to go through all sorts of hallucinatory experiences. On being wakened, he seemed at first to know nothing at all of what had taken place during his hypnotic sleep. Bernheim then asked him in so many words to tell him what had happened while he was under hypnosis. The man declared that he could not remember anything. Bernheim, however insisted upon it, pressed him, and assured him that he did know and that he must remember and lo and behold the man wavered, began to reflect, and remembered in a shadowy fashion first one of the occurrences which has been suggested to him, then something else, his recollection growing increasingly clear and complete until finally it was brought to light without a single gap. Now since in the end he had the knowledge without having learnt anything from any other quarter in the meantime, we are justified in concluding that these recollections were in his mind from the outset. They were merely inaccessible to him; he did not know that he knew them but believed that he did not know. In fact, his case was exactly similar to what we assume the dreamer's to be.

I hope you are duly surprised that this fact is already established and that you will ask me: "Why did you not refer to this proof before, when we were considering errors and came to the point of ascribing to a man who had made a slip of the tongue intentions behind his speech, of which he knew nothing and which he denied? If it is possible for a man to believe that he knows nothing of experiences of which nevertheless he does possess the recollection, it seems no longer improbable that there should be other mental processes going on within him about which also he knows nothing. We should certainly have been impressed by this argument and should have been in a better position to understand about errors." Certainly I might have brought forward this proof then but I reserved it for a later occasion when there would be more need for it. Some of the errors explained themselves; others suggested to us that in order to understand the connection between the phenomena, it would be advisable to postulate the existence of mental processes of which the person is entirely ignorant. With dreams we are compelled to seek our explanations elsewhere, and besides I am counting on your being more ready to accept in this connection a proof from the field of hypnosis. The condition in which we perform errors must seem to you normal and as such, to bear no similarity to that of hypnosis. On the other hand, there exists a clear relationship between the hypnotic state and sleep, the essential condition of dreaming. Hypnosis is actually called *artificial sleep*; we say to the people whom we hypnotize: Sleep, and the suggestions made to them are comparable to the dreams of natural sleep. The mental situation is really analogous in the two cases. In natural sleep we withdraw our interest from the whole outer world; so also in hypnotic sleep with the exception of the one person who has hypnotized us and with whom we remain in rapport. Again, the so-called "nurse's sleep" in which the nurse remains in rapport with the child and can be wakened only by him is a normal counterpart of hypnotic sleep. So it does not seem so very audacious to carry over to natural sleep something which is a condition in hypnosis. The assumption that some knowledge about his dream exists in the dreamer and that this knowledge is merely inacces-

sible to him so that he himself does not be lieve he has it is not a wild invention Inci dentally we observe here that a third way of approaching the study of dreams is thus opened out for us we may approach it by the avenue of sleep disturbing stimuli by that of day dreams and now by that of the dreams sug gested during hypnosis

Now perhaps we shall return to our task with greater confidence We see it is very prob able that the dreamer knows something about his dream the problem is how to make it pos sible for him to get at his knowledge and impart it to us We do not expect him immediately to tell us what his dream means but we do think he will be able to discover its source from what circle of thoughts and interests it is de rived With errors you w ll —

w

i

t

i again we shall ask the dreamer how he came to have the dream and his next words must be regarded as giv ing the explanation in this case also It makes no difference to us therefore whether he thinks that he does or does not know anything about it and we treat both cases alike

This technique is certainly very simple nevertheless I am afraid it will provoke most strenuous opposition in you You will say An other assumption the third! And the most im probable of all! When I ask the dreamer what ideas come to him about the dream do you mean to say that his very first association will give the desired explanation? But surely he might have no as ociation at all or heaven only knows what the association might be We can not imagine upon what grounds such an ex pectation is based It really implies too much trust in Providence and this at a point where rather more exercise of the critical faculty would better meet the case Besides a dream is not like a single slip of the ton ue but is made up of many elements That being so upon which association is one to rely?

You are right in all the unessentials It is true that a dream differs from a slip of the tongue in the matter of its many elements as well as in other points We must take account of that in our technique So I suggest to you that we divide the dream up into its various ele ments and examine each element separately then we shall have re establ shed the analogy with a slip of the tongue Again you are right in saying that the dreamer when questioned on the single elements of the dream may reply that he has no ideas about them There are cases in which we accept this answer and later I will tell you which these are curiously enough they are cases about which we our selves may have certain definite ideas But in general when the dreamer declares that he has no ideas we shall contradict him press him to answer assure him that he must have some idea and—shall find we are right He will produce an association any one it does not matter to us what it is He will be especially ready with information which we may term historical H will say That is somethin which happened yesterday (as in the instance of the two *pro saic* dreams quoted above) or That reminds me of something which happened recently and in this way we shall come to notice that dreams are much more often connected with impressions of the day before than we thought at first Finally with the dream as his starting point he will recall events which happened less recently and at last even some which lie very far back in the past

In regard to the main issue however you are wrong When you think it arbitrary to as sume that the first as ociation of the dreamer must give us just what we are looking for o at any rate lead to it and further that the as sociation is much more likely to be quite capricious and to have no connection with what we are looking for and that it only shows my blind trust in Providence if I expect anything else—then you make a very great mistake I have already taken the liberty of pointing out to you that there is within you a deeply rooted belief in psychic freedom and choice that this belief is quite unscientific and that it mu t give ground before the claims of a determinism which governs even mental life I ask you to have some respect for the *fact* that that one association and nothing else occurs to the dreamer when he is questioned Nor am I set ting up one belief against another It can be proved that the association thus given is not a matter of choice nor indeterminate and tha it is not unconnected with what we are look n for Indeed I have recently learnt—not that I attach too much importance to the fact—that experimental psycholo y itself has brought for ward similar proofs

Because of the importance of the matter I ask you to pay special attention to this When I ask a man to say what comes to his mind about any given element in a dream I require

him to give himself up to the process of FREE ASSOCIATION *which follows when he keeps in mind the original idea*. This necessitates a peculiar attitude of the attention, something quite different from reflection, indeed, precluding it. Many persons adopt this attitude without any difficulty but others when they attempt to do so display an incredible ineptitude. There is a still higher degree of freedom in association which appears when I dispense with any particular stimulus-idea and perhaps only describe the kind and species of association that I want, for example, ask someone to let a proper name or a number occur to him. An association of this sort would, one would say, be even more subject to choice and unaccountable than the kind used in our technique. Nevertheless it can be shown that in every instance it will be strictly determined by important inner attitudes of mind, which are unknown to us at the moment when they operate, just as much unknown as are the disturbing tendencies which cause errors and those tendencies which bring about so-called chance action.

I myself and many after me have repeatedly made an examination of names and numbers called up without any particular idea as starting-point; some of these experiments have been published. The method is this: trains of associations are stirred up by the name which occurred, and these associations, as you see, are no longer quite free but are attached just so far as the association to the different elements of the dream are attached; this train of associations is then kept up until the thoughts arising from the impulse have been exhausted. By that time, however, you will have explained the motivation and significance of the free association with a name. The experiments yield the same result again and again; the information they give us often includes a wealth of material and necessitates going far afield into ramifications. The associations to numbers that arise spontaneously are perhaps the most demonstrative; they follow upon one another so swiftly and make for a hidden goal with such astounding certainty that one is really quite taken aback. I will give you just one example of a name analysis of this sort, because it happens to be one which does not involve the handling of a great mass of material.

Once when I was treating a young man I happened to say something on this subject and to assert that in spite of our apparent freedom of choice in such matters we cannot, in point of fact, think of any name which cannot be shown to be narrowly determined by the immediate circumstances, the idiosyncrasies of the person experimented with and his situation at the moment. As he was inclined to be sceptical, I proposed that he should make the experiment himself then and there. I knew that he had usually numerous relationships of all sorts with women and girls, so I told him that I thought he would have an exceptionally large number to choose from if he were to let the name of a woman occur to him. He agreed. To my surprise, or rather perhaps to his own, he did not overwhelm me with an avalanche of women's names but remained silent for a time and then confessed that the only name which came into his mind at all was "Albine." "How curious! What do you connect with this name? How many Albines do you know?" Strangely enough, he knew no one of the name of Albine and he found no associations to the name. One might infer that the analysis had failed, but no, it was already complete and no further association was required. The man himself was unusually fair in colouring and whilst talking to him in analysis I had often jokingly called him an albino; moreover we were just in the midst of tracing the feminine element in his nature. So it was he himself who was this female albino, the woman who interested him most at the moment.

In the same way the tunes which suddenly come into a man's head can be shown to be conditioned by some train of thought to which they belong and which for some reason is occupying his mind without his knowing anything about it. It is easy to show that the connection with the tune is to be found either in the words which belong to it or in the source from which it comes. I must however make this reservation, that I do not maintain this in the case of really musical people, of whom I happen to have had no experience; in them the musical value of the tune may account for its suddenly emerging into consciousness. The first case is certainly much more common. I know of a young man who for some time was absolutely haunted by the tune (a charming one, I admit) of the song of Paris in *Helen of Troy* until his attention was drawn in analysis to the fact that at that time an "Ida" and a "Helen" were rival in his interest.

If then, the associations which arise quite freely are determined in this way and belong to some definite context, we are surely justified in concluding that associations attached to one single stimulus-idea must be equally narrow

ly conditioned Examination shows as a fact that they are not only attached in the first place to the stimulus idea which we have provided for them but that they are also dependent in the second place on circles of thoughts and interests of strong affective value (*complexes* as we call them) of whose influence at the time nothing is known that is to say on unconscious activities

Associations attached in this way have been made the subject of very instructive experiments which have played a notable part in the history of psycho analysis Wundt s school ori inated the so called *association experiment* in which the subject of the experiment is bidden to reply to a given *stimulus word* as quickly as possible with whatever *reaction word* occurs to him The following points may then be noted the interval which elapses between the utterance of the stimulus word and of the reaction word the nature of the latter and possibly any mistake which comes in when the same experiment is repeated later and so on The Zurich School under the leadership of Bleuler and Jung arrived at the explanation of the reactions to the association experiment by asking the person experimented upon to throw light upon any associations which seemed at all remarkable by means of subsequent associations In this way it became clear that these unusual reactions were most strictly determined by the complexes of the person concerned By this discovery Bleuler and Jung built the first bridge between experimental psychology and psycho analysis

Having heard this you may possibly say We admit now that free associations are subject to determination and not a matter of choice as we thought at first and we admit this also in the case of associations to the elements of dreams But it is not this that we are bothering about You maintain that the association to each element in the dream is determined by some mental background to this particular element a background of which we know nothin We cannot see that there is any proof of this Naturally we expect that the association to the dream element will be shown to be conditioned by one of the complexes of the dreamer but what good is that to us? That does not help us to understand the dream it merely leads to some knowledge of th se so called complexes as did the association experiment but what have these to do with the dream?

You are right but you are overlooking an important point the very thing which deterred me from choosing the association experiment as a starting point for this discussion In this experiment the stimulus word the in le thing which determines the reaction is chosen by us at will and the reaction stands as intermediary between this stimulus word and the complex aroused in the person experimented upon. In the dream the stimulus word is replaced by something derived from the mental life of the dreamer from sources unknown to him and hence may very probably be itself a *derivative of a complex* It is not therefore alto ether fantastic to suppose that the further associations connected with elements of the dream are determined by no other complex than that which has produced the particular element i self and that they will lead to the discovery of that complex

Let me give you another instance which may serve to show that in the case of dreams the facts bear out our expectations The forgetting of proper names is really an excellent prototype of what happens in dream analysis only that in the former case one person alone is concerned while in the interpretation of dreams there are two When I forget a name temporarily I am still certain that I know it and by way of a détour through Bernheim s experiment we are now in a position to achieve a similar certainty in the case of the dreamer Now really me th thinking about it even with effort is any use I can however always think of another or of several other names instead of the forgotten one When such a substitute name occurs to me spontaneously only then is the similarity between this situation and that of dream analysis evident The dream element also is not what I am really lookin for it is only a substitute for something else for the real thing which I do not know and am trying to discover by means of dream analysis Again the difference is that when I forget a name I know perfectly well that the ub ti tute is not the right one whereas we only arrived at this conception of the dream element by a laborious process of investigation Now there also is a way in which when we forget a name we can by starting from the substi tute arrive at the real thing eluding our consciousness at the moment i e the forgotten name If I turn my attention to these substitute names and let further associations to them come into my mind I arrive after a short or

a long way around at the n me I have forgot ten, and in so doing I discover that the substitutes I have spontaneously produced had a defin..e connection with and were determined by the forgotten name

I will gi e you an instance of an analysis of thi sort One day I found that I could not call to mind the ame of the small country on the R era of which Monte Ca lo is the capital. It was most an oy ng but so it was I del d into all my knowledge about the coun try I th ught f Princ Albert of the Ho se of Lu gnan of his marriages of his pass n for deep-sea explorati n—in fact of everything I could ummo up but all to no purpo e So I gave up trying to th k and inst ad of the name I had lost let s b tit te names come in to my mi d They came qu ckly Monte Ca lo itself then Piedmo t Alban a, Montev deo Colico Albania was the first to attract my at tention t was immediat ly replaced by Mo tenegro p bably b cause of the co trast between black and white Then I n ticed th t four of the s b t t te ames ha e the same syll ble m and immed ately I recalled the forg tten wo d and cried out Mo a o You see the substit tes eall or nated in the for gotten name th fou first came fr m th first syllab e and the la t ga e the seque ce of the syllables and th wh le of the fi al syllable Incid tally I co ld qu t eas ly fi d out what had made me fo get th me fo the t me being M naco s th It l an name fo Mun h and t w s some th ghts onnected with this t wn whi h had ted a inhib t on

Now that a ery p etty example but t is too s mpl I other cases y m ht ha to tak l c e n of sociat ons to th subst tute nam a d then the analogy to dream anal s would be cleare I ha e had experi es f th t sort too A stra ge once in ted m t drink m Ital an w with him and the inn h found h had f rg tten the nam f th wine whi h h had me nt to orde count of his ry pleasant recollec ti ns of t A umber of d m l b t tute names occurred to h m and fr m these I wa bl t inf that th thought of som o called Hed had m d h m forg t the name of the win S re e gh t nly d d he t ll me that th re had bee a H dw g w th him on the occa on wh he first ta t d th wi but th di ery b ought b k t him the nam h wa ted H wa now happ ly married and H dw g belon ed to ea li days whi h he did ot care t recall.

What is po s'ble in the case of forgotten names must be also possible in the interpreta tion of dreams starti g from the substitute, we must be able to arrive at the re l object of our se rch by means of a train of associa tions and further argu ng from what happens w th forgotten names we may assume that the associations to the *dream-element will have* been determined not only by that element but also by th real thought *which is not in con* sciousness If we could do this we should have *gone some way* towards justifying our technique

SEVENTH LECTURE

Manifest Content a d Latent Thoughts

You see that our study of errors has not been fruitless Thanks to our exertions in that d ec tion we have—rea oning from the hypotheses with wh ch you are familiar—secured two results a conception of the nature of the dream element and a technique of dream interpreta *tion The concept on of the dream-element* is as foll ws it is not in tself a primary and esse t al thing a *tho ght p ope* but a substi tute for something else unknown to the per son c cerned just as is the underlying inten tion of the error s bst tute for some hin the knowledge f which s ind ed pos e sed by the dreame but is inaccess ble to him We hope to

the sa d el ments

I am now g ng to propose that we introduce an alteratio in our omenclature order to make our term ology more flexible Instead of u ng the words *hidden naccessible* or *prop er* let us gi more preci e descriptio a d say *nacce bl to the conscious ss of the d m consc*io s By that we mean n thi g m e than was impl ed in the case of th f rg tt n w d th und lying inte t n r spo s bl f th error that s to say *unc nsc ous t the m ment* It follows that n co tradi tin tion we may call the dream-ele m ts themsel es d those substitute-ideas rri ed at by the pro f associat *con*-*sc ou* \ theoretical mpl cat o is so fa con ta ed in these t rms n cept n ca be tak en t th use f the w d *unc nsc us* as de cripti at o ce applicable and easy to understand.

Now transferring our conception from the single element to the dream as a whole it fol lows that the latter is the distorted substitute for something else something unconscious and that the task of dream interpretation is to dis cover these unconscious thoughts Hence are derived three important rules which should be observed in the work of dream interpretation

1 We are not to trouble about the surface meaning of the dream whether it be reasonable or absurd clear or confused in no case does it constitute the unconscious thoughts we are seeking (An obvious limitation of this rule will force itself upon us later)

2 We are to confine our work to calling up substitute ideas for every element and not to ponder over them and try to see whether they contain something which fits in nor to trouble ourselves about how far they are taking us from the dream element

3 We must wait until the hidden uncon scious thou hts which we are seeking appear of their own accord just as in the case of the missing word Monaco in the experiment which I described

Now we understand also how entirely indif ferent it is whether we remember much or lit tle of our dreams above all whether we re member them accurately or not The dream as remembered is not the real thing at all but *a distorted substitute* which by calling up other substitute ideas provides us with a means of approaching the thought proper of brin ing into consciousness the unconscious thou hts underlying the dream If our recollection was at fault all that has happened is that a further distortion of the substitute has taken place and this distortion itself cannot be without motivation

We can interpret our own dreams as well as those of others indeed we learn more from our own and the process carries more convic tion Now if we experiment in this direction we notice that something is working against us Associations come it is true but we do not admit them all we are moved to criticize and to select We say to ourselves of one associa tion No that does not fit in—it is irrelevant and of another That is too absurd and of a third That is quite beside the point and then we can observe further that in making such objections we stifle and in the end actu ally banish the associations before they have become quite clear So on the one hand we tend to hold too closely to the initial idea that is the dream element itself and on the other by allowing ourselves to select we vitiate the results of the process of free association If we are not attemptin the interpretation by ourselves but are allowin omeone else to interpret we shall clearly perceive another motive impelling us to this selection forbid den as we know it to be We find ourselves thinking at times No this association is too unpleasant I cannot or will not tell it to him

Clearly these objections threaten to spoil the success of our work We must guard a ainst them when we are interpretin our own dreams by resolving firmly not to yield to them and in interpreting those of someone el e by laying down the hard and fast rule that he must not withhold any association even if one of the four objections I have named rises up again t it namely that it is too unimportant too ab surd too irrelevant or too unpleasant to peak of He promises to keep this rule and we may well feel annoyed when we find how badly he fulfils his promise later on At first we account for this by imaginin that in pite of our authoritative assurance he is not convinced that the process of free association will be justified by its results and perhaps our next idea will be to win him over first to our theory by giving him books to read or sendin him to lectures so that he may be converted to our views on the subject But we shall be saved from any such fal e steps by observing that the same critical objections against certain as ociations arise even in ourselves whom we surely cannot suspect of doubt and can only subsequently on second thoughts as it were be overcome

Instead of being annoyed at the dreamer s disobedience we can turn this experience to good account as a means of learning something new something which is the more important the more unprepared we were for it We realize that the work of dream interpretation is en countering opposition by a *resistance* which expresses itself in this very form of critical objections This resistance is independent of the theoretical conviction of the dreamer We learn even more than this Experience shows that a critical objection of this nature is never justified On the contrary the associations which people wish to suppress in this way prove *without except on* to be the most important to be decisive for the discovery of the unconscious thought When an association is accompanied by an objection of this sort it positively calls for special notice

This resistance is omething entirely new a phenomeno which we ha e found by *follow ing* out our h potheses alth ugh t was not in *cluded* in them We are not altog ther agree-ably surpri ed by this new f ctor which we have t recko with, for we uspect already that i will n t make our work any ea ier it might almost tempt us to gi e up the effort with dreams al gether To take uch a trivial subject and th to ha e so m ch trouble in stead f spinning alon smoothly with our tech niq B t we might n th oth hand find these difficult s fa cinating and be led to sus pect that the w k will be worth the tr uble Resistan es in ariably confro t us when we try t penetrate to th hidden uncon cious thought from the sub titute offered by the dream-ele ment. We may suppo e therefore that some thing ery ignificant must be con ealed be-

thing which he ought ot to ha e

As soo as w introduce into our subj ct the *dynamic c cepti f resi tan* we mu t bea in mind that this f ctor s something quantitati ely ariable The e re great r and lesse res tan es and w are prepared to find these differences showing themsel es in the course of w k. P haps we ca c nnect with this another experi ce als met w th in the proces f dre m int rpret t on I mean that som times nly a few a ciations—per haps n t more than o e—suffice t lead us from th dream-element t th uncon ous thought behind t, whilst ther occa ns lo g chains f associations are necessary and many critical bjections ha e t be ove com W hall prob-bly think that th umbe of a sociations nec essary varies with the arying trength f the resistances and ery lik ly we shall be right. If there i only a l ght resistance the substi tut s t far removed f m th unconsciou thought trong resistance th ther hand causes great di tortio of the latt r and there by enta ls l g journey back from the sub-stitut to the unconsc ous thought tself

Pe haps this would be g od mom t t s lect a dream d try our techniqu upo it to see wheth th xpectat ons we h e te tained are ealized. V ry w ll but what dream hall we choose? W d not know how difficult t is f m t dec d can I mak t clear t you yet what th difficulties Ob iously there mu t be dreams in which on the whole there is very little distortion and one would think it would be best to begin w th these. But wh ch are the lea t distorted dreams? Those wh ch make good ense and are not con fu ed of which I have already gi en you two examples? In assum g this we should make a h ws that these high hat I make no special condition but take any dream at random you would probably be very much disappointed. We m gh have to observe and record such a vast number of as ociations to the single dream-elements that it would be qu te impos ble to gain an clear view of the work as a whole If we write the dream down a d c mpare with it ll the as ociat ons which it produces we are lik ly to find that they ha e multiplied the length f the text of th dream many times So the most practical method would seem to be that of selectin for analysis several h rt dream each of which can at least convey some idea to us or co firm ome sup-po t n This w ll be the course we shall de c de to tak unless experi ce gives us a hint where we ou ht *really to look for* lightly dis torted dreams

B t I can suggest an ther means of mpl fying matters o e which lies right before us. I stead f attempting the interpretat on of *whole dre ms let us confi e oursel es to s ngle* dream-elements and fi d o t by taking a series of examples h w the pplication of our tech niqu explains them

(*a*) A lady related that as a child he ery *often dreamt that God had a poi ted paper c p on his head* How re ou going to understand that without the h lp of the dreamer? It sounds quite nonsens cal but the absurdity disappears when the lady says that as a littl girl she u ed t ha e cap like that put on her head at table because sh wouldn t gi e up looki g at the plates f her br th rs and sisters t ee wh th e y f them had been gi en m re than she. E d tly th cap was meant to serve the pur po f blink rs thi p e of hi t rical infor

f th dreamer As I had been t ld that God knew everything and s w everythi th dream could onl mean that I knew nd s w every thing as God did even when they tri d to pre ent me Thus example perhaps too simple

(b) A sceptical patient had a longer dream in which certain people were telling her about my book on *Wit* and praising it very highly Then something else came in about a *canal* *it might have been another book in which the word* canal *occurred or something else to do with a canal she did not know it was quite vague*

Now you will certainly be inclined to suppose that the *canal* in the dream will defy interpretation on account of its vagueness You are right in expecting difficulty but the difficulty is not caused by the vagueness on the contrary the difficulty in interpretation is caused by something else by the same thing that makes the element vague The dreamer had no association to the word *canal* naturally I did not know what to say either Shortly afterwards to be accurate on the next day she told me that an association had occurred to her which *perhaps* had something to do with it It was in fact a witty remark which some one had told her On board ship between Dover and Calais a well known author was talking to an Englishman who in some particular context quoted the words *Du sublime au ridicule il n y a qu'un pas* The author answered *Oui le Pas-de Calais* meaning that he regarded France as sublime and England as ridiculous Of course the Pas de Calais is a *canal*—that is to say the Canal la Manche—the English Channel Now you ask do I think that this association had anything to do with the dream? Certainly I think so it gives the true meaning of the puzzling dream-element Or are you inclined to doubt that the joke already existed before the dream and was the unconscious thought behind the element *canal* and to maintain that it was a subsequent invention? The association reveals the scepticism dis ui ed under the obtrusive admiration and resistance was no doubt the cause both of the association being so long in occurring to her and of the corresponding dream element being so vague Observe here the relation between the dream element and the unconscious thought underlying it it is as it were a fragment of the thought an allusion to it by being isolated in that way it became quite incomprehensible

(c) A patient had a fairly long dream part of which was as follows *Several members of his family were seated at a table of a particular shape* etc This table reminded the dreamer that he had seen one of the same sort when he was visiting a certain family From that his thoughts ran on thus in this family the relation between father and son was a peculiar one and the patient presently added that his own relations with his father were as a matter of fact of the same nature So the table was introduced into the dream to indicate this parallelism

It happened that this dreamer had long been familiar with the demands of dream interpretation otherwise he might have taken exception to the idea of investigating so trivial a detail as the shape of a table We do literally deny that anything in the dream is a matter of chance or of indifference and it is precisely by enquiring into such trivial and (apparently) unmotivated details that we expect to arrive at our conclusion You may perhaps still be surprised that the dream work should happen to choose the table in order to express the thought Our relationship is just like theirs. But even this is explicable when you learn that the family in question was named *Tischler* (*Tisch* = table) In making his relations sit at this table the dreamer s meaning was that they too were *Tischler* And notice another thing that in relating dream interpretations of this sort one is forced into indiscretion There you have one of the difficulties I alluded to in the matter of choosing examples I could easily have given you another example instead of this one but probably I should have avoided this indiscretion only to commit another in its place

This seems to me a good point at which to introduce two new terms which we might have used already Let us call the dream as related *the manifest dream content* and the hidden meaning which we should come by in following out the associations *the latent dream thoughts* Then we must consider the relation between the manifest content and the latent thoughts as shown in the above examples There are many varieties of these relations In examples (a) and (b) the manifest dream-element is also an integral part of the latent thoughts but only a fragment of them A small piece of a great composite mental structure in the unconscious dream thoughts has made its way into the manifest dream also in the form of a fragment or in other cases as an allusion like a catch word or an abbreviation in a telegraphic code The interpretation has to complete the whole to which this scrap or allusion belongs which it did most successfully in example (b) One method of the distorting process in which the dream work consists is therefore that of substituting for something else a

fragment of an allusion. In example (c) we notice, moreover, another possible relation between manifest content and latent thought, a relation which is even more plainly and distinctly expressed in the following examples:

(d) The dreamer was pulling a certain lady of his acquaintance out of a ditch. He himself found the meaning of this dream-element by means of the first association. It meant: he picked her out, preferred her.*

(e) Another man dreamt that his brother was digging up his garden all over again. The first association was to deep-trenching, for very trenches, the second gave the meaning. The brother was *retrenching*. (Retrenching his expenses.)

(f) The dreamer was climbing a mountain from which he had a remarkably wide view. This sounds most reasonable, perhaps no interpretation is called for, and we have only to find out what recollection is referred to in the dream, and what had aroused it. No, you are mistaken; it comes out that this dream needed interpretation just as much as any other more confused. For the dreamer remembers nothing about mountain-climbing himself; instead, it occurs to him that an acquaintance is publishing a *Rundschau* (Review) on the subject of our relations with the most distant parts of the earth. Hence, the latent thought is one in which the dreamer identifies himself with the 'surveyor' (lit. one who takes a survey).

Here you come across a new type of relation between the manifest and the latent element in dreams. The former is not so much a distortion of the latter as a representation—a plastic, concrete piece of imagery originating in the sound of a word. It is true that this amounts in effect to distortion, for we have long forgotten from what concrete image the word sprang and hence fail to recognize it when that image is substituted for it. When you consider that the manifest dream consists of visual images in by far the greatest number of cases and less frequently of thoughts and words, you will easily realize that this kind of relation between the manifest and the latent has special significance in the structure of dreams. You see too that in this way it becomes possible for a long series of abstract thoughts to create substitute-images in the manifest dream which do indeed serve the purpose of concealment. This is how our picture-puzzles are made up. The source of the semblance of wit which goes with this type of representation is a special question which we need not touch on here.

There is a fourth kind of relation between the manifest and the latent elements which I will say nothing about until the time comes for it in my account of our technique. Even then I shall not have given you a full list of these possible relations, but we shall have sufficient for our purpose.

Now do you think you can summon up courage to venture on the interpretation of a whole dream? Let us see whether we are *adequately* equipped for the task. I shall not, of course, choose one of the most obscure, but all the same it shall be one which shows the characteristics of dreams in a well marked form.

A young woman who had already been married for a number of years dreamt as follows: *She was at the theatre with her husband, and one side of the stalls was quite empty. Her husband told her that Elise L. and her fiancé also wanted to come, but could only get bad seats, three for a florin and a half, and of course they could not take those. She realised then on her own they did not lose much by this.*

The first thing stated by the dreamer is that the occasion giving rise to the dream is alluded to in the manifest content: her husband had really told her that Elise L., an acquaintance of about her own age, had become engaged, and the dream is the reaction to this piece of news. We know already that in many dreams it is easy to point to some such occasion occurring on the day before, and that this is often traced by the dreamer without any difficulty. This dreamer supplies us with further information of the same sort about other elements in the manifest dream. To what did she trace the detail of one side of the stalls being empty? It was an allusion to a real occurrence of the week

anxiety had been quite superfluous, for one side of the stalls was almost empty. It would have been time enough if she had bought the tickets on the actual day of the performance and her husband did not fail to tease her about having been in too *great a hurry*. Next, what about the one florin and a half (1 fl. 50 kr.)? This was traced to quite another context which had nothing to do with the former, but it again refers

* This example has been altered in translation to bring in the play upon words in English.—TR.

See note on preceding example.—T.

to some news received on the previous day Her sister in law had had a present of 150 florins from her husband and had rushed off *in a hurry* like a silly goose to jeweller s shop and spent it all on a piece of jewellery What about the number three? She knew nothing about that unless this idea could be counted an association that the engaged girl Elise L was only three months younger than she her self who had been married ten years And the absurdity of taking three tickets for two peo ple? She had nothing to say to this and refused to give any more associations or information whatever

Nevertheless her few associations have pro vided us with so much material that it is pos sible to discover the latent dream thoughts We are struck by the fact that in her statements references to time are noticeable at several points which form a common basis for the different parts of this material She had got the theatre tickets *too soon* taken them in *too great a hurry* so that she had to pay extra for them in the same way her sister in law had *hurried* off to the jeweller s with her money to buy an ornament with it as though she might *miss something* If the strongly emphasized points *too early too great a hu ry* are con nected with the occasion for the dream (name ly the news that her friend only three months *younger* than herself had now found a good husband after all) and with the criticism ex pressed in her asperity about her sister in law that it was *folly* to be so precipitate there oc curs to us almost spontaneously the following construction of the latent dream thoughts for which the manifest dream is a highly distorted substitute

It was really *foolish* of me to be in such a hurry to marry! Elise s example shows me that I too could have found a husband later on (The over haste is represented by her own con duct in buying the tickets and that of her sister in law in buying the jewellery Going to the theatre is substituted for getting married) This would be the main thought perhaps we may go on though with less certainty because the analysis in these passages ought not to be unsupported by statements of the dreamer And I might have had one a hundred times better for the money! (150 florins is 100 times more than one florin and a half) If we may substitute the dowry for the money it would mean that the husband is bought with the dowry both the jewellery and the bad seats would stand for the husband It would be still more de irable if we could see some connection between the element *three tickets* and a hus band but our knowled e does not as yet ex tend to this We have only found out that the dream expresses *depreciation* of her own hus band and regret at having *married so early*

In my opinion we shall be more surprised and confused by the result of this our first at tempt at dream interpretation than satisfied with it Too many ideas force themselves upon us at once more than as yet we can master We see already that we shall not come to the end of what the interpretation of this dream can teach us Let us immediately sin le out those points in which we can definitely ee some new knowledge

In the first place we note that in the latent thoughts the chief emphasis falls upon the ele ment of hurry in the manifest dream that is exactly a feature about which we find nothin Without analysis we could have had no sus picion that this thought entered in at all It seems possible therefore that precisely the main point round which the unconscious thoughts centre does not appear in the mani fest dream at all This fact must radically change the impression made upon us by the whole dream In the second place in the dream there is a nonsensical combination of ideas (three for one florin and a half) in the dream thoughts we detect the opinion It was folly (to marry so early) Can one reject the con clusion that this thought It was *folly* is represented by the introduction into the mani fest dream of an *absurd* element? In the third place comparison shows us that the relation between manifest and latent elements is no simple one certainly not of such a kind that a manifest always replaces a latent element The relation between the two is of the nature of a relation between two different groups so that a manifest element can represent several latent thoughts or a latent thought be replaced by several manifest elements

As regards the meaning of the dream and the dreamer s attitude towards it here again we might find many surprising things to say The lady certainly admitted the interpretation but she wondered at it she had not been aware that she had such d sparaging thoughts of her husband she did not even know why she should so disparage him So there is still much that is incomprehensible about it I really think that as yet we are not properly equipped for inter preting a dream and that we need further in struction and preparation first

EIGHTH LECTURE

CHILDREN'S DREAMS

WE HAD the impression that we had advanced too rapidly. Let us therefore retrace our steps a little. Before we made our last experiment in which we tried to overcome the difficulty of dream-distortion by means of our technique, we said that it would be best to circumvent it by confining ourselves to dreams in which distortion is absent or occurs only to a very slight extent, if there are any such dreams. In doing this we are again deviating from the actual course of development of our knowledge, for in reality it was only after consistently applying our method of interpretation and after exhaustive analysis of dreams in which distortion occurred, that we became aware of the existence of those in which it is lacking.

The dreams we are looking for are met with in children, short, clear, coherent and easy to understand, they are free from ambiguity and yet are unmistakable dreams. You must not think, however, that all dreams in children are of this type. Distortion in dreams begins to appear very early in childhood, and there are on record dreams of children between five and six years old which already show all the characteristics of the dreams of later life. But, if you confine yourselves to those occurring in the period between the dawn of recognizable mental activity and the fourth or fifth year of life, you will discover a series which we should characterize as infantile, and, in the later years of childhood, you may find single dreams of the same type; indeed, even in grown-up people under certain conditions dreams appear which are not very different from the typically infantile.

Now from these children's dreams it is possible to obtain without any difficulty trustworthy information about the essential nature of dreams, which we hope will prove to be decisive and universally valid.

1. In order to understand these dreams there is no need for an analysis nor for the employment of any technique. It is not necessary to question the child who relates his dream. But we must know something about his life, in every instance there is some experience from the previous day which explains the dream. The dream is the mind's reaction in sleep to the experience of the previous day.

Let us consider some examples in order to base our further conclusions upon them.

(a) A boy of a year and ten months old had to present someone with a basket of cherries as a birthday gift. He plainly did it very unwillingly, although he had been promised some of them for himself. The next morning, he told his dream: "Hermann eaten all the cherries."

(b) A little girl of three and a quarter years went for the first time for a trip on the lake. When they came to land she did not wish to leave the boat and cried bitterly: the time on the water had evidently gone too quickly for her. Next morning she said: "Last night I was sailing on the lake." We may probably infer that this trip lasted longer.

(c) A boy five and a quarter years old was taken on an excursion to the Escherntal near Hallstatt. He had heard that Hallstatt lay at the foot of the Dachstein and had shown great interest in that mountain. From the lodgings in Aussee there was a fine view of the Dachstein, and with a telescope it was possible to make out the Simony Hut on top. The child had repeatedly endeavoured to see the hut through the telescope but nobody knew whether he had succeeded. The excursion began in a mood of joyful expectation. Whenever a new mountain came into sight, the little boy asked: "Is that the Dachstein?" Every time his question was answered in the negative he grew more out of sorts and presently became silent and refused to climb a little way up to the waterfall with the others. He was thought to be overtired, but the next morning he said quite happily: "Last night I dreamt that we were in the Simony Hut." So it was with this expectation that he had taken part in the excursion. The only detail he gave was one he had heard before: "You have to climb up steps for six hours."

These three dreams will be enough to give us all the information we need at this point.

2. We see that these childhood dreams are no meaningless; they are complete comprehensible mental acts. Remember the medical verdict about dreams which I told you, and the comparison with unskilled fingers wandering over the keys of the piano. You cannot fail to notice how sharply this conception is contradicted by the children's dreams I have quoted. Now it would surely be most extraordinary if a child were able to achieve the performance of complete mental acts during sleep and the grown-up person in the same situation contented himself with spasmodic reactions. Besides we have every reason for attributing better and deeper sleep to the child.

3. In these dreams there is no distortion and therefore they need no interpretation; the

manifest and the latent content is here identical From this we conclude that *distortion is not essential to the nature of the dream* I expect that this statement will take a weight off your minds Nevertheless closer consideration forces us to admit that even in these dreams distortion is present though in a very slight degree that there is a certain difference between the manifest content and the latent dream thought

4 The child s dream is a reaction to an experience of the previous day which has left behind a regret a longing or an unsatisfied wish *In the dream we have the direct undisguised fulfilment of this wish* Now consider our discussion as to the part played by the external or internal somatic stimuli as disturbers of sleep and be etters of dreams We learnt certain quite definite facts on this point but this explanation only held good in a small number of dreams In these children s dreams there is nothing to indicate the influence of such somatic stimuli we can make no mistake about it for the dreams are perfectly comprehensible and each can easily be grasped as a whole But we need not on that account give up our notion of the stimulus as causing the dream We can only ask why we forget from the outset that there are *mental* as well as bodily sleep disturbing stimuli surely we know that it is these which are mainly responsible for disturbing the sleep of the grown up person in that they hinder him from bringing about in himself the mental condition essential for sleep i e the withdrawal of interest from the outside world He wi hes not to have any interruption in his life be would prefer to continue working at whatever occupies him and that is the reason why he does not sleep The mental stimulus which disturbs sleep is therefore for a child the unsatisfied wish and his reaction to this is a dream

5 This takes us by a very short step to a conclusion about the function of dreams If dreams are the reaction to a mental stimulus their value must lie in effecting a discharge of the excitation so that the stimulus is removed and sleep can continue We do not yet know how this discharge through the dream [illegible]

[illegible] against them) but are guardians and deliverers of it from disturbing influences True we are apt to think we should have slept better if we had not dreamed but there we are wrong the truth is that without the help of the dream we should not have slept at all and we owe it to the dream that we slept as well as we did It could not help disturbing us a little just as a policeman often cannot avoid making a noise when driving off disturbers of the peace who would wake us

6 That dreams are brought about by a wish and that the content of the dream expresses this wish is one main characteristic of dreams. The other equally constant feature is that the dream does not merely give expression to a thou ht but represents this wish as fulfilled in the form of an hallucinatory experience. I hould like to sail on the lake runs the wish which gives rise to the dream the content of the dream itself is I am sailing on the lake So that even in these simple dreams belongin to childhood there is still a difference between the latent and the manifest dream and still a distortion of the latent dream thought *in the translation of the thought into an experience* In interpretin a dream we must first of all undo this process of alteration If this is to be regarded as one of the most universal characteristics of all dreams we the [illegible]

[illegible] wish my brother would retrench he *is to* retrench Of the two universal characteristics here mentioned the second is obviously more likely to be acknowledged without opposition than the first

It is only by extensive investigations that we can make sure that what produces the dream must always be a *wish* and cannot sometimes be a preoccupation a purpose or reproach but the other characteristic remains unaffected namely that the dream does not merely reproduce this stimulus but by a kind of living it throu h removes it sets it aside relieves it.

7 In connection with these characteristics of dreams we may take up again our comparison between dreams and errors In the latter we distinguished between a disturbing tendency and one which is disturbed the error being a compromise between the two Dreams fall into the same category the disturbed tendency can only of course be the tendency to sleep while the disturbing tendency resolves itself into the mental stimulus which we may call the *wish* (clamouring for gratification) since at present we know of no other mental stimulus disturbing sleep Here again the dream is the result of a compromise we sleep and yet we experience the satisfaction of a wish we gratify a wish and at the same time continue to

sleep Each ach eves part uccess and part failure

8 Y u w'll remember that at one po nt we hoped to find a path to an understanding of the pro l ms p esented by dreams in the fact that certai very tran parent phan asy forma ti ns are called *d y-d eams* Now these day dreams are literally wi h fulfilme ts fulfilments f amb tiou or erotic w shes wh ch we recog nize as such they are however carried out in thought and howe er dly im mned they never take the form of hallucinat ry experi ences H re th refore the less cert n of the two main characterist cs of the dream s re tained, whereas the other t whi h the condi tion f sleep i esse tial and whi h cann t be realized i wakin life s entirely lacking So in languag we fi d a hint that a wish f lfil ment is a main characteri t c of dreams And further if the xperie ce we have in dreams is only anoth form f imaginati e representa tion a form which becomes poss'ble under the peculiar co ditions f the leeping state—*a noc turnal d y-d m* as we mi ht call t—we un derstand at once how t s that the process of dream formation ca abrogat the stimulus operating at night a d ca bring gratificat on fo day-dreaming also mode f activ ty closely linked up with grat ficat on which is in fact th only reaso why people practise t.

Again, there are other lingui t c expre s ns, besides this which imply the same thing We are familiar with the p o erbs "The p g dreams of ms and the goose of maize "What d hickens dream of? Of mill t The proverb you see goes even l w in the scale than we d beyond the child to the an mal d asserts that th t t of dreams is th *satisf cti n f* want. And there re many phrases which seem to point t the ame thing ay as beautiful as dr am I sh uld ever h e dreamt f su h thi g I eve m mned that in my wild t d eams H e col loquial spee h lea ly parti l in ts judg ment Of ourse there are also anxi ty-d eams d dreams the onte t f whi h is painful diff rent but these ha e t gi en rise to an special phrases W d deed speak f bad dreams but by a *d m* pure a d simpl rmo usa lw ys u d rstands som s rt of xqui t wi h f lfilment. N is there any p ove b whi h tt mpt to ssert th t pig o geese dream of be la gh red!

It of ours incon ivable that this w h f l lli g charact r l dreams hould ha es caped the otic f wr t rs on the subject. On the contrary they have very often remarked upon it but it has not occurred to any of them to recognize this characteristic as un versal and to take it as the key to the explanation of dreams We can ea ily imagine what may have deterred them and later we will discuss the question

Now see how much informat on we have gai ed and that with hardly any trouble from our st dy of ch ldren s dreams! We have learnt that the function of dreams is to p otect sleep that they arise out of two conflicting tenden cies of wh ch the o e the des e for sleep re mains constant whilst the other endeavours to

re wi h fulfilments and hallucinatory experi ences And meanwhile we could almost have forgotten that we were studying psycho-a aly sis Apart from the connect on we have made between dreams a d errors our work has not borne any specific stamp Any psycholog t know g nothing of the assumpt ons of psycho-analysis could ha e gi en this explanation of children s d eams Why has no one done so?

If only all d eams were of the infantile type th problem would be s l ed and ou task al ready ach eved a d that w thout quest on g the dreamer referri g to the unco c ous or having r course to the process of free associa t o Clea ly it is in this d rection that we m t co t ue our work We ha e already repeatedly f d that characteri t cs alleged to be uni versally alid ha e aft rwards p o ed to hold good only fo a certa kind a d a limited num ber f d eams So the question we now have t dec de i whethe th common character i t cs revealed by child en s dreams are any more stable than these and whether they hold also for those dreams whose meaning is not ob- us and in whose manifest co tent we can cognize no ref enc t a wi h remaini g from the day bef Ou dea s that these ther d eams ha e und go e a good deal of d to t on and on th t ccount we mu t refrain from immediate judgment. We su pect to that to unra el this distortion we shall eed the h lp of

perative physical needs—hunger thirst sexual desire—and are wish fulfilments in the sense of being reactions to internal somatic stimuli Thus I have on record the dream of a little girl one year and seven months old which consisted of a kind of menu to ether with her name (Anna F strawberries bilberries egg pap) the dream being a reaction to a day of fasting enforced on account of indi estion due to eating the fruit which appeared twice in the dream At the same time her grandmother—their combined ages totalled seventy—was obliged owing to a floating kidney to go without food for a day and dreamt that night that she had been invited out and had had the most tempting delicacies set before her Observations on prisoners who are left to go hungry and on people who suffer privations whilst traveling or on expeditions show that in these circumstances they regularly dream about the satisfaction of their wants Thus Otto Nordenskjold in his book on the Antarctic (1904) tells us of the band of men in whose company he spent the winter (Vol I p 336) Our dreams showed very clearly the direction our thoughts were taking Never had we dreamt so frequently and so vividly as at that time Even those of our comrades who usually dreamt but rarely had now long stories to tell in the mornings when we exchanged our latest experiences in this realm of phantasy All the dreams were about that outside world now so far away but often they included a reference to our condition at the time eating and drinking were incidentally the pivot on which our dreams most often turned One of us who was particularly good at going out to large dinners in his sleep was deli hted when he could tell us in the morning that he had had a three course dinner Another dreamt of tobacco whole mountains of tobacco another of a ship which came full sail over the water at last clear of ice Yet another dream deserves mention the postman came with the letters and gave a long explanation of why they were so late he said he had made a mistake in delivering them and had had great trouble in getting them back again Of course things even more impossible occupied our minds in sleep but the lack of ima ination in almost all the dreams which I dreamt myself or heard the others tell was quite striking It would certainly be of great psychological interest if we had a record of all these dreams You can imagine how we longed for sleep when it offered each one of us all that he most eagerly desired Another quotation this time from Du Prel Mungo Park, when nearly dying of thirst on a journey in Africa dreamt continually of the well watered hills and valleys of his home So Trenck tormented with hunger in the redoubt at Magdebourg saw himself in his dream surrounded by sumptuous meals and George Back who took part in Franklin s first expedition when on the point of dying of hunger owing to their terrible privations dreamt regularly of abundant food to eat

Anyone who has made himself thirsty at ni ht by eating highly seasoned dishes at supper is likely to dream of drinking Of course it is not possible to relieve acute hunger or thirst by dreaming in that case we awake thirsty and are obliged to drink real water The service of the dream is here of little practical accou t but it is none the less clear that it was called up for the purpose of protecting sleep from the stimulus impelling us to wake up and act Where the intensity of the desire is less *sat s faction* dreams do often answer the purpose

In the same way when the stimulus is that of sexual desire the dream provides sati fac tion but of a kind which shows peculiarities worthy of mention Since it is a characteristic of the sexual impulse that it is a degree le s dependent on its object than are hunger and thirst the satisfaction in a pollution dream can be real and in consequence of certain difficulties in the relation to the object (which will be discussed later) it particularly often happens that the real satisfaction is yet connected with a vague or distorted dream content This peculiarity of pollution dreams makes them as O Rank has observed suitable objects for the study of dream distortion Moreover with adults dreams of desire usually contain besides the satisfaction something else springing from a purely mental source and requiring interpretation if it is to be understood

We do not maintain by the way that wish fulfilment dreams of the infantile type occur in adults solely as reactions to the imperative desires I have mentioned We are equally familiar with short clear dreams of this type occasioned by certain dominating situations and unquestionably produced by mental stimuli For example there are *impatience*-dreams in which someone making preparations for a journey for a theatrical performance in which he is specially interested or for a lecture or a visit has his expectations prematurely reali ed in a dream and finds himself the night before the actual experience already at his journey s

end, at the the tre or talk ng to the friend he is g e to vis t. Or ga n there is the *comfort* dream, rightly s -called, in which s m one who wants *to go o sleeping dreams* that he has already got up that he is wa hi g or is at

dreams the des re for leep whi n us e recognized as regula ly participat g n dr m f rmation, exp e ses itself plainly nd appears as their ct al originat r The eed for sl ep ranks tself qu te rightly w th the th r great phys cal needs.

I w uld ref r ou at this point to a pic ture by Schwind in the Schack Gall ry at Mun ch and would k you to notic how cor rectly the artist has reali ed the wa in which a dream arises ut of dom nating s t ati n Th p ct re s called *Th Prisoner's D e m* and the subj ct of th dream must undoubtedly be hi escape It is happy tho ht that the prisoner is to escape by th wi dow f it is through the window that th ray of light has e t red and roused him f om sl p Th gnomes tandin one above the other no d bt repre sent the suc e pos t s h would ha e to sum in climb g up to the wind w and if I am not mistak n a d d not attrib te too m ch intent nal d gn t th artist the fea

own.

I have said that in all dream other than those of hildre and s h as form t the infantile type w encount the obsta le of dist rtion. We cann t immed at ly say whether they too re wish-f lfilm ts as we are in lined t uppos an w guess f om thei man fest c tent in what mental timulu they nemate, prov that they l'k th thers ndea our t rem e or relie th timulus They must in f ct be int rp eted i e trans- lated the process f d tort mu t be re- versed d the manifest cont t repl d by the latent tho ght bef re we can mak any d fini pron un ement wh th what we have found out bo t f til d ams may cla m to h ld g od fo all d eams alike

NINTH LECTURE

The Dream-C sorship

Ou st dy f hildrens d am has t ght us how dreams originat what th es ential charact r is a d what the r funct on Dreams

ha e bee able to explain o e group o y tu e wh ch we termed dreams of the infa t le type We do not yet know how t may be w th others neither do we und rstand them The re lt we ha e arrived at already is one however of wh ch th significance is not to be under-esti mated E ery time that we fully understand a dre m it p oves to be a wish fulfilment and this c ncidence cannot be accidental or un import t

Dreams of another type are assumed by us to be di torted ubst tutes for an unknown content which first of all has to be traced we ha e arious ground for this a sumption am ngst others the analogy to our concept on f rror Our ext task s to investigate and underst d this *d eam-d stort on*

It is d eam-d stortion which makes dreams seem strange and i comprehe sible There are several things we want to know about it first wh ce t comes (its d namics) econdly what t does a d fi ll how it does t Further we can say that distortio is the production of the *d eam w k* Let us describe the dre m w rk and trace ut th forces in it

Now let me tell yo a dream recorded by a lady w ll known in ps cho-analytical circles who said that the d eame was an eld ly woma highly culti ated and held i great e teem The dream was not a al sed a d our inform nt bserved that for psycho analysts it eded n interpreti g Nor d d the dreamer herself interp et it but she crit cized it nd co demned t in such way as though she knew what it meant Imagi she sa d ch abominable no ense be g dreamt by a woman of fifty whose ly thou ht day and night is c m fo h child.

I w ll w tell y u th d eam which is abo t lo e ers w r time Sh we t t the First M lit ry H sp tal d said to the sentin l t the gate that she must speak t the phys ci ch f (gi ing a am whi h she did not kn w) as he wi hed to offe hers lf for serv in the hosp tal I say g this she empha ized the word serv ce in such way that th ergeant at ce pe ed that she w s speaking f lo e rv ce As h wa an old lady he let b pa s afte som hesitation,

Fra D on H g H llm th.
Li b dien = l service pop l xpres- adapted f m "mil tary service. —Tr.

but instead of finding the chief physician she came to a large gloomy room where a number of officers and army doctors were standing or sitting around a long table She turned to a staff doctor and told him her proposal he soon understood her meaning The words she said in her dream were I and countless other women and girls of Vienna are ready for the soldiers officers or men to This ended in a murmur She saw however by the half embarrassed half malicious expressions of the officers that all of them grasped her meaning The lady continued I know our decision sounds odd but we are in bitter earnest The soldier on the battlefield is not asked whether he wishes to die or not There followed a minute of painful silence then the staff doctor put his arm round her waist and said Madam supposing it really came to this that (murmur) She withdrew herself from his arm thinking They are all alike and replied Good heavens I am an old woman and perhaps it won t happen to me And one condition must be observed age must be taken into account so that an old woman and a young lad may not (murmur) that would be horrible The staff doctor said I quite understand but some of the officers amongst them one who as a young man had made love to her laughed loudly and the lady asked to h

[illegible] mation that she did not know his name The staff doctor however with the utmost respect and courtesy showed her the way to the second floor up a very narrow iron spiral staircase leading direct from the room where they were to the upper storeys As she went up she heard an officer say That is a tremendous decision no matter whether she is young or old all honour to her! With the feeling that she was simply doing her duty she went up an endless staircase

This dream was repeated twice within a few weeks with alterations here and there which as the lady remarked were quite unimportant and entirely meaningless

The way in which this dream progresses corresponds to the course of a day dream there are only a few places where an interruption occurs and many individual points in its content might have been cleared up by enquiry this however as you know was not undertaken But the most striking and to us the most interesting thin about it is the occurrence of many gaps not in the recollection but in the content In three places the latter is as it were blotted out where these gaps occur the speeches are interrupted by a *murmur* As we did not analyse the dream we have strictly speaking no right to say anything about its meaning but there are certain indications from which we may draw conclusions e.g the words *love service* and above all the broken speeches immediately preceding the murmurs require completion of a kind which admits of only one construction If we do so complete them a phantasy results in which the content is that the dreamer is ready at the call of duty to offer herself to gratify the sexual needs of the troops irrespective of rank This is certainly shocking a model of a shamelessly libidinous phantasy but—the dream says nothing about this Just where the context demands this confession there is in the manifest dream an indistinct murmur something has been lost or suppres ed

I hope you recognize how obvious is the inference that it is just the shocking nature of these passages which has led to their suppression Now where will you find a parallel to what has taken place here? In these times you have not far to seek Take up any political paper and you will find that here and there in the text something is omitted and in its place the blank white of the paper meets your eye you know that this is the work of the press censor Where these blank spaces occur there originally stood something of which the official censors disapproved and which has been deleted on that account You probably think it a pity for that must have been the most interesting part the *cream* of the news

On other occasions the official censor has not dealt with the sentence in its completed form for the writer foreseeing which passages were likely to be objected to by the censor has forestalled him by softening them down making some slight modification or contenting himself with hints and allusions to what he really wants to write In this case there are no blanks but from the roundabout and obscure mode of expression you can detect the fact that at the time of writing the author had the censorship in mind

Now keeping to this parallel we say that tho e speeches in the dream which were omitted or disguised by a murmur have also been sacrificed to some form of censorship We actually use the term DREAM CENSORSHIP and ascribe part of the distortion to its agency Wherever there are gaps in the manifest dream we know

that the cens rsh.p ı respon 'ble and ındeed we should go furth r and recognize that wh rever amongst other more clea ly defined elements one ppears which ıs fainter more ınd finite o m re dub us ın *recollect on* ıt ı es dence of the wo k of the censorship It ıs however seldom that t takes a form s und s gused, so na 'e, as we m ght say as t does ın the case f the *dream* bout *lo e service* far more ften the censorship makes ıt elf felt ın the se o d way I me tioned by effectın modificatio s hints and allusı ns ın place of the true meaning

Th re ıs a third way ın which the dream censorsh p works to which the ordinances of th press censorship supply *no parallel* but t happens that I can dem nstrate to you this part cula mode of activity n the part of the dream-censorship ın the only dream hith rto an lysed by us You will remember the dream f the "three b d theatre t ckets co ting one florin and a half In the latent thoughts under lying this dream the element *to great a hurry too early* was ın the foreground th meaning was It was folly t marry so *early* t was foo sh also to take the tickets o *early* ıt was ridiculous f the ste ın law to spend her mo ey so *hurriedly* on p ce of jewell ry N thing of this central element of the dream thoughts appeared ın th manifest content where ev rything was f cussed on going to the theat e and takın tick ts By this displacement f the *cent and regr upı g f the dream* elements, the manifest co tent was m de so unlike the latent th ghts th t n body would suspect th prese ce f the latter behind the f rm This *displa ement of a cent* ıs o e of the principal means employ d ın dı tort on and ıt ıs this which gı 'es th dream that character of trangeness which makes th dream *r him* self l ctant to re gnize t as the prod ct of hı own mind

Omıs modificatı n, *regroup ng* f ma terial—thes then re th modes f the dream *censorship s* ctivity a d th mea employed ın distort on. Th censorship ıts lf s th riginator o on of th riginat rs of d t t on the subject f our present enquiry *Modification* and *alterat* ın arrangement are c mmonly ıncluded under th term *displace ment*

Aft these rema ks th ctivities f the dream-censorsh p let u turn ur attentı t ts dynam cs I hope you re ot taking th xpression *censor h p* ın too anth opomorphic sense picturing t yourselves the censo as a stern l ttle man'kin or a p nt who l es ın a little chamber of the brain and there d charges the duties of his office and neither mu t you

th t you imagine a

onal

d s

ıt we

may *regard ıt merely as* hich to express a dynamic relation hip Th s need ot hı d r us fr m ask n what sort of tend encies exe cı e this influence a d ıs t exercised upon a d further we must not be surprised to disc ver that we have already *come across* the censorship pe haps without recognizing ıt.

we discovered that our efor s to p *from the d eam-eleme t* to the unc scious thought proper for which the former ıs a sub-stitute encountered a certa n *resistance* The strength of this res tance we said varies be ing sometimes enormous and at other t mes very slight. In th latter case we need only a few connecting links f r the work of ı terpreta tıo but whe e there *ıs great res tance* we are compelled to go through long chain of associ ations which carry us f r from the ınıt al ıd a, and on the way we ha 'e to o ercome all the difficult es of profes edly critical objections to s.ociations arising That which we encoun tered as resista ce ın the wo k of ı terpret tion w n w *meet again as the censorship* ın the d eam w k the res stance ıs s mply the cen sorship objectified ıt pr 'es to us that the power of the c nsorship ıs not exhausted n effecting distortion being thereby ext guı.hed b t that the censorship remains as a perman nt

ance e countered d ring ı terpretatio varies w th each eleme t so too th degree of distor tı n effected by th cens rship diff r t for ea h element of a whole dream A ompari on of th manifest a d the late t dream shows that ertain l te t elements are *completely* eliminat d other m re o less modified and others again appe ın the manif t dream content unaltered or pe haps e 'e ten fied

Ou purpose however was to find out which are th tendenc e e cısing the censorship and upo which t ndenc es ıt ı ex r ısed Now this question which ıs fundamental for the under tanding of dream a d perhaps of human life alt g th ıs easy to answer when we survey

the series of dreams which we have succeeded in interpreting The tendencies which exercise the censorship are those which are acknowledged by the waking judgment of the dreamer and with which he feels himself to be at one You may be sure that when you repudiate any correctly found interpretation of a dream of your own you do so from the same motives as cause the censorship to be exercised and distortion effected and make interpretation necessary Consider the dream of our lady of fifty her dream although it had not been interpreted struck her as shock [illegible] h [illegible] t [illegible] attitude of c [illegible] mination which caused the offensive passages in the dream to be replaced by a murmur

Those tendencies against which the dream censorship is directed must next be described from the point of view of this inner critical standard When we do this we can only say that they are invariably of an objectionable nature offensive from the ethical aesthetic or ocial point of view things about which we do not dare to think at all or think of only with abhorrence Above all are these censored wishes which in dreams are expressed in a distorted fashion manifestations of a boundless and ruthless egoism for the dreamer s own ego makes its appearance in every dream and plays the principal part even if it knows how to disguise itself completely as far as the manifest content is concerned This *sacro egoismo* of dreams is certainly not unconnected with the attitude of mind essential to sleep the withdrawal of interest from the whole outside world

The ego which has discarded all ethical bonds feels itself at one with all the demands of the sexual impulse those which have long been condemned by our aesthetic training and those which are contrary to all the restraints imposed by morality The striving for pleasure —the libido as we say—chooses its objects unchecked by any inhibition preferring indeed those which are forbidden not merely the wife of another man but above all the incestuous objects of choice which by common consent humanity holds sacred—the mother and the sister of men the father and the brother of women (Even the dream of our fifty year old lady is an incestuous one the libido being unmistakably directed towards the son) Desires which we believe alien to human nature show themselves powerful enough to give rise to dreams Hate too rages unrestra nedly wishes for revenge and death wishes against thos who in life are nearest and dearest—parents brothers and sisters husband or wife the dreamer s own children—are by no means uncommon These censored wishes seem to rise up from a veritable hell when we know their meaning it seems to us in our waking moments as if no censorship of them could be severe enough Dreams themselves however are not to blame for this evil content you surely have not forgotten that their harmless nay useful, function is to protect sleep from disturbance Depravity does not lie in the nature of dreams in fact you know that there are dreams which can be recognized as gratifyin justifiable desires and urgent bodily needs It is true that there is no distortion in these dreams but then there is no need for it they can perform their function without offending the ethical and aesthetic tendencies of the ego Remember too that the degree of distortion is proportionate to two factors on the one hand the more shocking the wish that must be censored the greater will be the distortion but it is also great in proportion as the demands of the censorship are severe Hence in a strictly brou ht up and prudish young girl a rigid censorship will distort dream excitations which we medical men would have recognized as permissible and harmless libidinous desires and which the dreamer herself would judge in the same way ten years later

Besides we are still not nearly far enou h advanced to allow ourselves to be outraged at the result of our work of interpretation I think we still do not understand it properly but first of all it is incumbent upon us to secure it against certain possible attacks It is not at all difficult to detect weak points in it. Our interpretations were based on hypotheses which we adopted earlier that there really is some meaning in dreams that the idea of mental processes being unconscious for a time which was first arrived at throu h hypnotic sleep may be applied also to normal sleep and that all associations are subject to determination Now if reasoning from these hypotheses we had obtained plausible results in our dream interpretation we should have been justified in concluding that these hypothe es were correct But what if these discoveries are of the kind I have described? In that case surely it seems natural to say The e results are impossible absurd at the very least highly improbable so there must have been something wrong about the hypotheses Either the dream is after all

not a mental phenomenon, or there is nothing which is unconscious in our normal condition, or there is a flaw somewhere in our technique. Is it not simpler and more satisfactory to as[sume] this than to accept all the abominable conclusions which we profess to have deduced from our hypotheses?

Both! It is both simpler and more satisfactory but it does not necessarily more correct. Let us give ourselves time, the matter [is] not yet ripe for judgment. First of all, we can make the case against our interpretations even stronger. The fact that our results are so unpleasant and repellent would not perhaps weigh so very heavily with us. A stronger argument is the emphatic and well-grounded repu[diation] given by dreamers of the wish-tendencies which we try to foist upon them after interpreting their dreams. "What," says one, "you want to prove to me from my dream that I grudge the money I have spent on my sister's dowry and my brother's education? But it is [out] of the question. I spend my whole time working for my brothers and sisters and my only interest in life is to do my duty by them, as, being the eldest, I promised our dead mother I would." Or a woman says, "I am supposed to wish that my husband were dead! Really that is outrageous nonsense. Not only is our married life very happy, though perhaps you won't believe that, but if he died I should lose everything I possess in the world." Or someone else will reply, "Do you mean to suggest that I entertain sexual desires towards my sister? The thing is ludicrous, she is nothing to me; we get on badly with one another and for years I have not exchanged a word with her."

We still might not be much impressed if these dreamers neither admitted nor denied the tendencies attributed to them; we might say that these are just the things of which they are quite unconscious. But when they detect in their own minds the exact opposite of such a wish as is attributed to them, and when they can prove to us by their whole conduct in life that the contrary desire predominates, surely we must be nonplussed. Is it not about time now for us to discard our whole work of dream interpretation as something which has led to a reductio ad absurdum?

No, not even now. Even this stronger argument falls to pieces when subjected to critical attack. Assuming that unconscious tendencies do exist in mental life, the fact that the opposite tendencies predominate in conscious life goes to prove nothing. Perhaps there is room in the mind for opposite tendencies, for contradictions existing side by side; indeed, possibly the very predominance of the one tendency conditions the unconscious nature of the opposite. So the first objections raised only amount to the statement that the results of dream interpretation are not simple and are very disagreeable. To the first charge we may reply that, however much enamoured of simplicity you may be, you cannot thereby solve one of the problems of dreams; you have to make up your mind at the outset to accept the fact of complicated relations. And, as regards the second point, you are manifestly wrong in taking the fact that something pleases or repels yourself as the motive for a scientific judgment. What does it matter if you do find the results of dream interpretation unpleasant, or even mortifying and repulsive? *Ça n'empêche pas d'exister*[1]—as I, when a young doctor, heard my chief Charcot say in a similar case

[illegible]

a physicist could prove to you that organic life on the earth was bound to become extinct before long, would you venture to say to him also, "That cannot be so, I dislike the prospect too much"? I think you would say nothing until another physicist came along and convicted the first of a mistake in his premises or his calculations. If you repudiate whatever is distasteful to you, you are repeating the mechanism of a dream structure rather than understanding and mastering it.

Perhaps then you will undertake to overlook the offensive nature of the censored dream wishes and will fall back upon the argument that it is surely very improbable that we ought [illegible]

[illegible] nothing of how you may appear in your own eyes, but have you met with so much goodwill in your superiors and rivals, so much chivalry in your enemies and so little envy amongst your acquaintances that you feel it incumbent on you to protest against the idea of the part played by egoistic baseness in human nature? Do you not know how uncontrolled and unreliable the average human being is in all that concerns sexual life? Or are you ignorant of the fact that all the excesses and aberrations of which we dream at night are crimes actually committed every day by men who are wide

[1] It won't kill you.—Ed.

awake? What does psycho analysis do in this connection but confirm the old saying of Plato that the good are those who content themselves with dreaming of what others the wicked actually do?

And now look away from individuals to the great war still devastating Europe think of the colossal brutality cruelty and mendacity which is now allowed to spread itself over the civilized world Do you really believe that a handful of unprincipled place hunters and corrupters of men would have succeeded in letting loose all this latent evil if the millions of their followers were not also guilty? Will you venture even in these circumstances to break a lance for the exclusion of evil from the mental constitution of humanity?

You will accuse me of taking a one sided view of war and tell me that it has also called out all that is finest and most noble in mankind heroism self sacrifice and public spirit That is true but do not now commit the injustice from which psycho analysis has so often suffered of reproaching it that it denies one thing because it affirms another It is no part of our intention to deny the nobility in human nature nor have we ever done anything to disparage its value On the contrary I show you not only the evil wishes which are censored but also the censorship which suppresses them and makes them unrecognizable We dwell upon the evil in human beings with the greater emphasis only because others deny it thereby making the mental life of mankind not indeed better but incomprehensible If we give up the one sided ethical valuation then we are sure to find the truer formula for the relation of evil to good in human nature

Here the matter rests We need not give up the results of our work of dream interpretation even though we cannot fail to find them strange Perhaps later we shall be able to come nearer to understanding them by another path For the present let us hold fast to this dream distortion is due to the censorship exercised by certain recognized tendencies of the ego over desires of an offensive character which stir in us at night during sleep Obviously when we ask ourselves why it is just at night that they appear and what is the origin of these reprehensible wishes we find that there is still much to investigate and many questions to answer

It would however be wrong if we neglected to give due prominence at this point to another result of these investigations The dream wishes which would disturb our sleep are unknown to us we first learn about them by dream interpretation they are therefore to be designated *unconscious at the moment* in the sense in which we have used the term But we must recognize that they are also more than unconscious at the moment for the dreamer denies them as we have so frequently found, even after he has learnt of them through the interpretation of his dream Here we have a repetition of the case which we first met with when interpreting the slip of the tongue hic cough where the after dinner speaker indignantly assured us that neither then nor at any time had he been conscious of any feeling of disrespect towards his chief We ventured even then to doubt the value of this assertion and assumed instead that the speaker was permanently ignorant of the existence of this feeling within him We meet with the same situation every time we interpret a dream in which there is a high degree of distortion and this lends an added significance to our conception We are now prepared to assume that there are processes and tendencies in mental life of which we know nothing have known nothing have for a very long time perhaps even never known anything about at all This gives the term *unconscious* a fresh meaning for us the qualification *at the moment or temporary* is seen to be no essential attribute the term may also mean *permanently unconscious* not merely *latent at the moment* You see that later on we shall have to discuss this point further

TENTH LECTURE

SYMBOLISM IN DREAMS

WE HAVE found out that the distortion in dreams which hinders our understanding of them is due to the activities of a censorship directed against the unacceptable unconscious wish impulses But of course we have not asserted that the censorship is the only factor responsible for the distortion and as a matter of fact a further study of dreams lead to the discovery that there are yet other causes contributing to this effect that is as much as to say if the censorship were eliminated we should nevertheless be unable to understand dreams nor would the manifest dream be identical with the latent dream thoughts

This other cause of the obscurity of dreams this additional contribution to distortion is revealed by our becoming aware of a gap in our technique I have already admitted to you

that there are occa ons when persons being analysed really ha e no assoc t ons to single elements in their dreams To be sure this does n t happe so often as they declare that it does in very many in_tances the ass ciation may yet be elicited by perseverance but still there remain a cert in number of cases where a_oci tion fa ls altogether or if someth ng s finally extorted it is not what we need If this happens during psycho analyt c treatment t ha certain s gnifica te which does not con c rn us h but t al o occurs in the course of interpretai o of d eams in norm l people or whe e re i terp et g our own When we are con inced in s ch c rcumstanc s that no amount of pres i g i of any use we finally di cover th t th s u welcome co t ngency reg ularly present itself whe e spec al dre m elements a in q estio and we begin to rec ogni e the operati n of s me new princ ple whereas at first we thou ht we h d nly come across an e c ptional c se in which our tech niqu had failed

In this w y it comes bout that we try to interpret the e *silent* el ments and attempt to translate th m by drawing *upon our own* re sou ce It c nnot fail t trike us that we arri at a satisf ctory mea g in every in sta c n whi h we e ture o this s b t tut o wh eas th dream remains m an ngle s a d di co cted s lo g s we do not esolve t use this m thod The acc m latu of many exa tly simil r tances th n affo ds us the required rtainty o r expe me t hav g been tried at first w th o s derable diffid nce

I am p ese tin all this om hat n o tline but that s ely allowable f purpo es of instructio t fals fied by so do g b t me ly mad impl

We a e in this way t c tant transla tion f e es f d eam-elements j st as in popular books d am we fi d su h trans latio f rything that curs n dreams Y u will t ha e f rg tte that when we em pl y the m thod of fre assoc t on u h c ta t s b titut ns for dream-eleme ts e er make th ppea an e

Now you w ll t ce say that this mod of int rpretati e m to y u fa m re un e t n and open to criti m than even th forme m thod f f oc t n. But the t ll something more t be said when we ha coll ct d f m ctual xperi nc a ufficient number f h nstant tra slat s we e n tually realiz that w ould tually ha e filled in these porti ns of the int rp etati f om ur own knowledge and that they really could have been understood without us ng the dream er s *associations* How it is that we are bound to know their meaning is a matter which will be dealt w th in the econd half of our d scussion.

We call a constant relation of this k nd be tween a dream-element and its translat on a *symbol c* one and the dream-element it elf a *symbol* of the unconsc ous dream thought You will *remember* that ome time ago when we were exam nin the different relations which may exist between dream-elements and the

very interesting points fo discuss on to which we will turn attention before sett ng forth our special observations on this subject Symbolism is pe haps the mo t remarkable part of our theory of dreams

F rst of all s ce the *relation* between a symbol and the idea symbolized *is an i vari* able one the latter being as it were a transla tion of th former ymbolism does in some mea ure realize the ideal f both ancie t a d popular dream interpretation one from wh ch we ha e moved ery far n our technique Symbols make it pos ble for us in certain c r cumstan es to int rpret a d eam without ques *tion g the dreamer* who *indeed in* a y case can tell us othi g about the symbols If the symbols c mmo ly appearing in dreams are kn wn nd al o the personality of the dreamer the co dit on nder which he li es and the impress ons in h s mind after wh ch his dream occurred we are often in a position to i terpret it traightaway to translate it at sight as it we e Such a feat flatt rs the anity of the interpret and mpres es the dreamer it is in plea ing c tr st to the labo s method of que t ni g the l tt B t do not let thi le d you away t s n part f our t sk to perform tricks nor s that m thod of interpretat on whi h s ba ed o a knowledge of symbol m on which can replace o even compa with that f f e ss c at on It is complementary to this latte and the result it yields are o ly us ful when appl d n connection w th the l tt As regard our k owledge f th dream e s mental s tu ti n, mo eov you m t c fl ct that y ha e n t nly to interpret d eam f peopl whom you kn w well that as a rule

you know nothing of the events of the previous day which stimulated the dream and that the associations of the person analysed are the very source from which we obtain our knowledge of what we call the mental situation

Further it is especially remarkable particularly with reference to certain considerations upon which we shall touch later that the most strenuous opposition has manifested itself again here over this question of the existence of a symbolic relation between the dream and the unconscious Even persons of judgment and standing who in other respects have gone a long way with psycho analysis have renounced their adherence at this point This behaviour is the more remarkable when we remember two things first that symbolism is not peculiar to dreams nor exclusively characteristic of them and in the second place that the use of symbolism in dreams was not one of the discoveries of psycho analysis although this science has certainly not been wanting in surprising discoveries If we must ascribe priority in this field to anyone in modern times the discoverer must be recognized in the philosopher K. A Scherner (1861) psycho analysis has confirmed his discovery although modifying it in certain important respects

Now you will wish to hear something about the nature of dream symbolism and will want some examples I will gladly tell you what I know but I confess that our knowledge is less full than we could wish

The symbolic relation is essentially that of a comparison but not any kind of comparison We must suspect that this comparison is subject to particular conditions although we can not say what these conditions are Not every thing with which an object or an occurrence can be compared appears in dreams as symbolic of it and on the other hand dreams do not employ symbolism for anything and every thing but only for particular elements of latent dream thoughts there are thus limitations in both directions We must admit also that we cannot at present assign quite definite limits to our conception of a symbol for it tends to merge into substitution representation etc and even approaches closely to allusion In one set of symbols the underlying comparison may be easily apparent but there are others in which we have to look about for the common factor the *tertium comparationis* contained in the supposed comparison Further reflection may then reveal it to us or on the other hand it may remain definitely hidden from us Again if the symbol is really a comparison it is remarkable that this comparison is not exposed by the process of free association and also that the dreamer knows nothing about it but makes use of it unawares nay more that he is actually unwilling to recognize it when it is brought to his notice So you see that the symbolic relation [illegible] iar kind [illegible] clear to [illegible] found [illegible] which will throw some light upon this unknown quantity

The number of things which are represented symbolically in dreams is not great The human body as a whole parents children brothers and sisters birth death nakedness—and one thing more The only typical that is to say regularly occurring representation of the human form as a whole is that of a *house* as was recognized by Scherner who even wanted to attribute to this symbol an overwhelming significance which is not really due to it People have dreams of climbing down the front of a house with feelings sometimes of pleasure and sometimes of dread When the walls are quite smooth the house means a man when there are ledges and balconies which can be caught hold of a woman Parents appear in dreams as *emperor* and *empress* *king* and *queen* or other exalted personages in this respect the dream attitude is highly dutiful Children and brothers and sisters are less tenderly treated being symbolized by *little animals* or *vermin* Birth is almost invariably represented by some reference to *water* either we are falling into water or clambering out of it saving someone from it or being saved by them i e the relation between mother and child is symbolized For dying we have setting out upon a *journey* or *travelling* by train while the state of death is indicated by various obscure and as it were timid allusions *clothes* and *uniforms* stand for nakedness You see that here the dividing line between the symbolic and the allusive kind of representation tends to disappear

In comparison with the poverty of this enumeration it cannot fail to strike us that objects and matters belonging to another range of ideas are represented by a remarkably rich symbolism I am speaking of what pertains to the sexual life—the genitals sexual processes and intercourse An overwhelming majority of symbols in dreams are sexual symbols A curious disproportion arises thus for the matters dealt with are few in number whereas the symbols for them are extraordinarily numerous

so that ea h of these few things can be ex pressed by many ymbols pract cally equ a le t When they are interpreted th refore the result of this pecul rity gi es universal ffense fo m contrast to the multifariou forms of its representation in dreams the interpretation of the symbols is very monotonous This is displeasin to everyo e wh com s to know of it but how can we help it?

As this is the first time in the course of these lectures that I ha e touched upon the exual life I owe you some explanation of the m nner in which I propose to treat thi subject Psycho analysis sees no occa ion for concealments r indirect allusions a d does not think it necessary to be a hamed of c nc rning itself with material so important t is of the opinion that it is right and proper t call everythin by its true nam hoping in this way the m re easily t avo d disturbin s ggest on The fact that I am peaking t a mixed udience can mak o difference in this No cience can be treated *in usum delph* or in a manne dapted to s hool gi ls the wom n present by appearing in this lect re-room ha e ta tly expre ed thei des r to be regarded on the same footin s th men

The mal genital organ is symbolically represented in dreams many diffe e t ways with most of which the c mmon dea u der lying th c mpari n s ea ily apparent I th first place the s cred number *thr* is symbolic of the whol m l genitalia. Its more o p cu ous and, to both se es more int resting part the penis, is symb lized primarily by obj cts whi h resemble t in form bein l g and up- ... *mbr llas b les t ees* ... the ... e ... body —that is t say pointed weapo t all sort *kni d ggers la s s b* fire-arm are imila ly sed *g ns pistols nd volvers* these last being very ppropriate symbol on ...

... haps the m st f eque tly occurring dream symbol y can n w ea ily tran lat t f yo rsel es. The s b titution f th mal o gan by bjects f om which wat fl ws is gain ... or other *mplements* are undoubtedly male sexual symbols based on an dea of the male organ wh ch is equally ea ily perceived.

The peculiar property of this member of be n able to raise it elf upright in defiance of the law of gravity part of the phenomenon of erect on leads to symbolic representation by means of *balloons aeroplanes* and, just recently *Zeppelins* But dreams ha e another much more imp ess ve way of symbol ng erection they make the organ of sex into the essential part of the whole person so that the *d amer h mself f es* Do not be upset by hear ing that dre ms of fly ng which we all kn w and which are often so beaut ful must be n terp eted as dreams of general sexual excitement, d eams of erection One psycho anal tic m e t gator P Federn has established th truth of thi interpretation beyond doubt but bes des th s Mou ly Vold, a man hi hly prai ed f h s sober judgment who carried out the ... h rms ... by h s own in est gations to the s... s on No mu t you think to object to this on the gr und that women can also have dream of flyi g you hould rather rem nd yoursel es that the purpose of dreams is wish-fulfilment and th t the wi h to be a man is frequently met with in w men, whether they are consci us of it r n t Further no one fam liar with anat my w ll be mi led by supposing that it is impos bl fo a woman to realize this wish by sensat ons imilar to those of a man for the w man s sexual organs include a small o e which resembles the pe s and this little organ the litoris does actually play during child hood and in the years before sexual intercourse th ame part as the large male o gan

Mal sexual symbols les easy to und rstand ar c rtain *eptil s a d fish s* abo e all th famous ymbol f the *serp t* Why *hat nd cloaks* a u ed in the ame way is c rta nly difficult t d e but thei symbolic meani g is quit unq est onable Finally t may be a ked wh th r the ep se tation of the male orga by some ther member such as th *ha d* or th *foot* m y be termed symbolic I th k th c text in which thi s wont to occur d the femal counterparts with which we meet f ce this c ncl s o upo us

Th female gen talia ar symbol cally rep e ent d by ll ch objects as shar with them th property of enclo g a space or ar capa

ble of acting as receptacles such as *pits hol lows and caves* and also *jars and bottles* and *boxes* of all sorts and sizes *chests coffers pockets* and so forth *Ships* too come into this category Many symbols refer rather to the uterus than to the other genital organs thus *cupboards stoves* and above all *rooms* Room symbolism here links up with that of houses whilst *doors and gates* represent the genital opening Moreover material of different kinds is a symbol of woman—*wood paper* and ob jects made of these such as *tables* and *books* From the animal world *snails and mussels* at any rate must be cited as unmistakable female symbols of the parts of the body the *mouth* as a representation of the genital opening and amongst buildings *churches and chapels* are symbols of a woman You see that all these symbols are not equally easy to understand

The breasts must be included amongst the organs of sex these as well as the larger hemi spheres of the female body are represented by *apples peaches and fruit* in general The pubic hair in both sexes is indicated in dreams by *woods and thickets* The complicated topogra phy of the female sexual organs accounts for their often being represented by a *landscape* with rocks woods and water whilst the im posing mechanism of the male sexual apparatus lends it to symbolization by all kinds of com plicated and indescribable *machinery*

Yet another noteworthy symbol of the fe male genital organ is a *jewel case* whilst *jewel* and *treasure* are used also in dreams to repre sent the beloved person and *sweetmeats* fre quently stand for sexual pleasures Gratification derived from a person s own genitals is indi cated by any kind of *play* including playing the piano The symbolic representation of onanism by *slid ng or gliding* and also by *pulling off a branch* is very typical A particularly remark able dream symbol is the *falling out* or *extrac tion of teeth* the primary significance of this is certainly castration as a punishment for onan ism Special representations of sexual inter course are less frequent in dreams than we should expect after all this but we may men tion in this connection rhythmical activities such as *dancing riding* and *climbing* and also *experiencing some violence* e g being run over To these may be added certain manual occu pations and of course being threatened with weapons

You must not imagine that these symbols are either employed or translated quite simply on all sides we meet with what we do not expect For instance it seems hardly credible that there is often no sharp discrimination of the different sexes in these symbolic representa tions Many symbols stand for sexual organs in general whether male or female for in stance a *little* child or a *little* son or daughter At another time a symbol which is generally a male one may be used to denote the female sexual organ or vice versa This is incompre hensible until we have acquired some knowl edge of the development of conceptions about sexuality amongst human beings In many cases this ambiguity of the symbols may be apparent rather than real and moreover the most strik ing amongst them such as weapons pockets and chests are never used bisexually in this way

I will now give a brief account beginning with the symbols themselves instead of with the objects symbolized to show you from what spheres the sexual symbols have for the most part been derived and I will add a few re marks relating particularly to those in which the attribute in common with the thing sym bolized is hard to detect An instance of an ob scure symbol of this kind is the *hat* or per hap head coverin s in general this usually has a masculine significance though occasionally a feminine one In the same way a *cloak* be tokens a man though perhaps sometimes with out special reference to the organs of sex It is open to you to ask why this should be so A *tie* being an object which hangs down and is not worn by women is clearly a male symbol, whilst *underlinen* and *linen* in general stands for the female *Clothes and uniforms* as we have heard represent nakedness or the human form *shoes and slippers* symbolize the female genital organs *Tables and wood* we have men tioned as being puzzling but nevertheless cer tain female symbols the *act of mounting lad ders* steep places or stairs is indubitably sym bolic of sexual intercourse On closer reflection we shall notice that the rhythmic character of this climbing is the point in common between the two and perhaps also the accompanying increase in excitation—the shortening of the breath as the climber ascends

We have already recognized that *landscapes* represent the female sexual organs mountains and rocks are symbols of the male organ *gar dens* a frequently occurring symbol of the fe male genitalia *Fru t* stands for the breasts not for a child *W ild a mals* denote human beings

Cf sweeth rt w t st —TR

whose senses are excited and, hence evil impulses or passions. *Blossoms and flowers* represent the female sexual organ, more particularly in virginity. In this connection you will recollect that the blossoms are really the sexual organs of plants.

We already know how rooms are used symbolically. This representation may be extended so that *windows and doors* (entrances and exits from rooms) come to mean the openings of the body, the fact of rooms being *open or closed* also accords with this symbolism, the *key* which opens them, is certainly a male symbol.

This is some material for a study of dream symbolism. It is not complete and could be both extended and made deeper. However I think it will seem to you more than enough, perhaps you may dislike it. You will ask, Do I then really live in the midst of sexual symbols? Are all the objects round me, all the clothes I wear, all the things I handle, always sexual symbols and nothing else? There really is good reason for surprised questions and the first of these would be: How do we profess to arrive at the meaning of these dream-symbols about which the dreamer himself can give us little or no information.

My answer is that we derive our knowledge from widely different sources, from fairy tales and myths, jokes and witticisms, from folk lore, i.e. from what we know of the manners and customs, sayings and songs of different peoples, and from poetic and colloquial usage of language. Everywhere in these various fields the same symbolism occurs, and in many of them we can understand it without being taught anything about it. If we consider these various sources individually, we shall find so many parallels to dream-symbolism that we are bound to be convinced of the correctness of our interpretations.

The human body is, we said, according to Scherner frequently symbolized in dreams by a house; by an extension of this symbolism windows, doors and gates stand for the entrances to cavities in the body, and the façades may either be smooth, or may have balconies and ledges to hold on to. The same symbolism is met with in colloquialisms; for instance, we speak of a *thatch of hair* or a *tile hat*, or say of someone that he is not right *in the upper storey*. In anatomy too we speak of the openings of the body as its *portal*.

We may at first find it surprising that parents appear in our dreams as kings and emperors and their consorts, but we have a parallel to this in fairy tales. Does it not begin to dawn upon us that the many fairy tales which begin with the words "Once upon a time there were a king and queen," simply mean, "Once upon a time there were a father and mother"? In family life the children are sometimes spoken of jestingly as *princes*, and the eldest son as the *crown prince*. The king himself is called the *father* of his people. Again in some parts little children are often playfully spoken of as *little animals*, e.g. in Cornwall, as *little toad*, or in Germany as *little worm*, and, in sympathizing with a child, Germans say *poor little worm*.

Now let us return to the house symbolism. When in our dreams we make use of the projections of houses as supports, does that not suggest a well known, popular German saying with reference to a woman with a markedly developed bust: "She has something for one to hold on to" *(Die hat etwas zum Anhalten)*, whilst another colloquialism in the same connection is "She has plenty of wood in front of her house" *(Die hat viel Holz vor dem Hause)*, as though our interpretation were to be borne out by this when we say that wood is a female maternal symbol.

There is still something to be said on the subject of wood. It is not easy to see why wood should have come to represent a woman or mother, but here a comparison of different languages may be useful to us. The German

named Madeira, and this name was given to it by the Portuguese when they discovered it, because at that time it was covered with dense forests, for in Portuguese the word for wood is *madeira*. But you cannot fail to notice that this *madeira* is merely a modified form of the Latin *materia*, which again signifies material in general. Now *materia* is derived from *mater* = mother, and the material out of which anything is made may be conceived of as giving birth to it. So in the symbolic use of wood to represent woman or mother we have a survival of this old idea.

Birth is regularly expressed by some connection with water; we are plunging into or emerging from water, that is to say, we give birth or are being born. Now let us not forget that this

symbol has a twofold reference to the actual facts of evolution Not only are all land mammals from which the human race itself has sprung descended from creatures inhabiting the water—this is the more remote of the two considerations—but also every single mammal every human being has passed the first phase of existence in water—that is to say as an embryo in the amniotic fluid of the mother s womb—and thus at birth emerged from water I do not maintain that the dreamer knows this on the other hand I contend that there is no need for him to know it He probably knows something else from having been told it as a child but even this I will maintain has contributed nothing to symbol formation The child is told in the nursery that the stork brings the babies but then where does it get them? Out of a pond or a well—again out of the water One of my patients who had been told this as a child (a little count as he was then) afterwards disappeared for a whole afternoon and was at last found lying at the edge of the castle lake with his little face bent over the clear water eagerly gazing to see whether he could catch sight of the babies at the bottom of the water

In the myths of the births of heroes a comparative study of which has been made by O Rank—the earliest is that of King Sargon of Akkad about 2800 B C—exposure in water and rescue from it play a major part Rank perceived that this symbolizes birth in a manner analogous to that employed in dreams When anyone in his dream rescues somebody from the water he makes that person into his mother or at any rate *a* mother and in mythology whoever rescues a child from water confesses herself to be its real mother There is a well known joke in which an intelligent Jewish boy when asked who was the mother of Moses answers immediately The Princess He is told No she only took him out of the water That s what *she* said he replies showing that he had hit upon the right interpretation of the myth

Going away on a journey stands in dreams for dying similarly it is the custom in the nursery when a child asks questions as to the whereabouts of someone who has died and whom he mis es to tell him that that person has gone away Here again I deprecate the idea that the dream symbol has its origin in this evasive reply to the child The poet uses the same symbol when he speaks of the other side as the undiscovered country from whose bourne *no traveller* returns Again in every day speech it is quite usual to peak of the la journey and everyone who is acquainted wi h ancient rites knows how seriously the idea of a journey into the land of the dead was taken, for instance in ancient Egyptian belief In many cases the *Book of the Dead* survives, which was given to the mummy like a Baedeker to take with him on the last journey Since burial grounds have been placed at a d tance from the houses of the living the last journey of the dead has indeed become a reality

Nor does sexual symbolism belong only to dreams You will all know the expression a *baggage* as applied contemptuously to a woman but perhaps people do not know that they are using a genital symbol In the New Testamen we read The woman is the weaker *vessel* The sacred writin s of the Jews the style of which so closely approaches that of poetry are full of expressions symbolic of sex which have not always been correctly interpreted and the exegesis of which e g in the Song of Solomon, has led to many misunderstandings In later Hebrew literature the woman is very frequently represented by a house the door standing for the genital opening thus a man complains when he finds a woman no longer a virgin that he has found the door open The symbol *table* for a woman also occurs in this literature the woman says of her husband I pread the table for him but he overturned it Lame children are said to owe their infirmity to the fact that the man overturned the table I quote here from a treatise by L Levy in Brunn *Sexual Symbolism in the B ble and the Talmud*

That ships in dreams signify women is a belief in which we are supported by the etymologists who assert that *ship (Schiff)* was originally the name of an earthen vessel and is the same word as *Schaff* (a tub or wooden vessel) That an oven stands for a woman or the mother s womb is an interpretation confirmed by the Greek story of Periander of Corinth and his wife Melissa According to the version of Herodotus the tyrant adjured the shade of his wife whom he had loved passionately but had murdered out of jealousy to tell him something about herself whereupon the dead woman identified herself by reminding him that he Periander had put his bread into a cold oven thus expressing in a disgui ed form a circumstance of which everyone else was ignorant In the *Anthropophyteia* edited by F S Kraus a work which is an indispensable textbook on

e g So g of S I 8

everything concerning the sexual life of different persons, we read that in a certain part of Germany people say of a woman who is delivered of a child that her oven has fallen to pieces. The kindling of fire and everything connected with this is permeated through and through with sexual symbolism, the flame always standing for the male organ and the fire-place or the hearth for the womb of the woman.

If you have chanced to wonder at the frequency with which landscapes are used in dreams to symbolize the female sexual organs, you may learn from mythologists how large a part has been played in the ideas and cults of ancient times by *Mother Earth* and how the whole conception of agriculture was determined by this symbolism. The fact that in dreams a room represents a woman you may be inclined to trace to the German colloquialism by which *Frauenzimmer* (lit. woman's room) is used for *Frau*, that is to say the human person is represented by the place assigned for her occupation. Similarly we speak of the Porte, meaning thereby the Sultan and his government, and the name of the ancient Egyptian ruler Pharaoh, merely means *great court*. (In the ancient Orient the courts between the double gates of the city were places of assembly like the market place in classical times.) But I think this derivation is too superficial, and it strikes me as more probable that the room came to symbolize woman on account of its property of enclosing within it the human being. We have already met with the house in this sense; from mythology and poetry we may take towns, citadels, castles and fortresses to be further symbols for women. It would be easy to decide this point by reference to the dreams of people who neither speak nor understand German. Of late years I have mainly treated foreign patients, and I think I recollect that in their dreams rooms stand in the same way for women, even though there is no word analogous to our *Frauenzimmer* in their language. There are other indications that symbolism may transcend the boundaries of language, a fact already maintained by the old dream-interpreter, Schubert, in 1862. Nevertheless, none of my patients were wholly ignorant of German, so that I must leave this question to be decided by those analysts who can collect instances in other countries from persons who speak only one language.

Amongst the symbols for the male sexual organ, there is scarcely one which does not appear in jests or in vulgar or poetic phrases, especially in the old classical poets. Here, however, we meet not only with such symbols as occur in dreams but also with new ones, e.g., the *implements* employed in various kinds of work, first and foremost, the *plough*. Moreover, when we come to male symbols, we tread on very extensive and much-contested ground which, in order not to waste time we will avoid. I should just like to devote a few remarks to the one symbol which stands, as it were, by itself. I refer to the number *three*. Whether this number does not in all probability owe its sacred character to its symbolic significance is a question which we must leave undecided, but it seems certain that many tripartite natural *objects*, e.g., the clover leaf, are used in coats-of-arms and as emblems on account of their symbolism. The so-called French Lily with its three parts and, again, the *triscelles*, that curious coat-of-arms of two such widely separated islands as Sicily and the Isle of Man (a figure consisting of three bent legs projecting from a central point) are supposed to be merely disguised forms of the male sexual organ, images of which were believed in ancient times to be the most powerful means of warding off evil influences (*apotropaea*) connected with this is the fact that the lucky *charms* of our own time may all be easily recognized as genital or sexual symbols. Let us consider a collection of such charms in the form of tiny silver pendants: a four-leaved clover, a pig, a mushroom, a horse shoe, a ladder and a chimney-sweep. The four leaved clover has taken the place of that with three leaves, which was really more appropriate for the purpose; the pig is an ancient symbol of fruitfulness; the mushroom undoubtedly symbolizes the penis: there are mushrooms which derive their name from their unmistakable resemblance to that organ (*Phallus impudicus*); the horseshoe reproduces the contour of the female genital opening, while the chimney-sweep with his ladder belongs to this company because his occupation is one which is vulgarly compared with sexual intercourse. (Cf. *Anthropophyteia*.) We have learnt to recognize his ladder in dreams as a sexual symbol; expressions in language show what a completely sexual significance the word *steigen* (to mount) has as in the phrases *Den Frauen nachsteigen* (to run after women) and *ein alter Steiger* (an old roué). So in French, where the word for step is *la marche*, we find the quite analogous expression for an old rake *un vieux marcheur*. Probably the fact that with many of the larger animals sexual intercourse necess

This is certainly so with English patients.—Tr.

tates a mounting or *climbing upon* the female has something to do with this association of ideas

Pulling off a branch to symbolize onanism is not only in agreement with vulgar descriptions of that act but also has far reaching parallels in mythology But especially remarkable is the representation of onanism or rather of castration as the punishment for onanism by the falling out or extraction of teeth for we find in folk lore a counterpart to this which could only be known to very few dreamers I think that there can be no doubt that circumcision a practice common to so many peoples is an equivalent and replacement of castration And recently we have learnt that certain aboriginal tribes in Australia practice circumcision as a rite to mark the attaining of puberty (at the celebration of the boy s coming of age) whilst other tribes living quite near have substituted for this practice that of knocking out a tooth

I will end my account with these examples They are only examples we I now more about this subject and you can imagine how much richer and more interesting a collection of this sort might be made not by dilettanti like our selves but by real experts in mythology anthropology philology and folk lore We are forced to certain conclusions which cannot be exhaustive but nevertheless will give us plenty to think about

In the first place we are confronted with the fact that the dreamer has at his command a symbolic mode of expression of which he knows nothing and does not even recognize in his waking life This is as amazing as if you made the discovery that your housemaid understood Sanscrit though you know that she was born in a Bohemian village and had never learnt that language It is not easy to bring this fact into line with our views on psychology We can only say that the dreamer s knowledge of symbolism is unconscious and belongs to his unconscious mental life but even this assumption does not help us much Up till now we have only had to assume the existence of unconscious tendencies which are temporarily or permanently unknown to us but now the question is a bigger one and we have actually to believe in unconscious knowledge thou ht relations and comparisons between different objects in virtue of which one idea can constantly be substituted for an other These compari ons are not instituted afresh every time but are ready to hand perfect for all time this we infer from their identity in different persons even probably in spite of linguistic differences

Whence is our knowledge of this symbolism derived? The usages of speech cover only a small part of it whilst the manifold parallels in other fields are for the most part unknown to the dreamer we ourselves had to collate them laboriously in the first instance

In the second place these symbolic relations are not peculiar to the dreamer or to the dream work by which they are expressed for we have discovered that the same symbolism is employed in myths and fairy tales in popular sayings and songs in colloquial speech and poetic phantasy The province of symbolism is extraordinarily wide dream symbolism is only a small part of it it would not even be expedient to attack the whole problem from the side of dreams Many of the symbols commonly occurring elsewhere either do not appear in dreams at all or appear very seldom on the other hand many of the dream symbols are not met with in every other department but as you have seen only here and there We get the impression that here we have to do with an ancient but obsolete mode of expression of which different fragments have survived in different fields one here only another there only a third in various spheres perhaps in slightly different forms At this point I am reminded of the phantasy of a very interestin insane patient who had ima ined a *primordial language (Grundsprache)* of which all these symbols were survivals

In the third place it must strike you that the symbolism occurring in the other fields I have named is by no means confined to sexual themes whereas in dreams the symbols are almost exclusively used to represent sexual objects and relations This again is hard to account for Are we to suppose that symbols originally of sexual si nificance were later employed differently and that perhaps the decline from symbolic to other modes of representation is connected with this? It is obviously impossible to answer these questions by dealing only with dream symbolism all we can do is to hold fast to the supposition that there is a specially close relation between true symbols and sexuality

An important clue in this connection has recently been given to us in the view expressed by a philologist (H Sperber of Upsala who works independently of psycho analysis) that sexual needs have had the largest share in the origin and development of language He says

that the first sounds uttered were a means of communication and of summoning the sexual partner and that, in the later development, the elements of speech were used as an accompaniment to the different kinds of work carried on by primitive man. This work was performed by associated efforts, to the sound of rhythmically repeated utterances, the effect of which was to transfer sexual interest to the work. Primitive man thus made his work agreeable, so to speak, by treating it as the equivalent of and substitute for sexual activities. The word uttered during the communal work had therefore two meanings, the one referring to the sexual act, the other to the labour which had come to be equivalent to it. In time the word was dissociated from its sexual significance and its application confined to the work. Generations later the same thing happened to a new word with sexual signification, which was then applied to a new form of work. In this way a number of root words arose which were all of sexual origin but had all lost their sexual meaning. If the statement here outlined be correct, a possibility at least of understanding dream-symbolism opens out before us. We should comprehend why it is that in dreams, which retain something of these primitive conditions, there is such an extraordinarily large number of sexual symbols and why weapons and tools in general stand for the male and materials and things worked on for the female. The symbolic relations would then be the survival of the old identity in words; things which once had the same name as the genitalia could now appear in dreams as symbolizing them.

Further, our parallels to dream-symbolism may assist you to appreciate what it is in psycho-analysis which makes it a subject of general interest in a way that was not possible to either psychology or psychiatry: psycho-analytic work is so closely intertwined with so many other branches of science, the investigation of which gives promise of the most valuable conclusions: with mythology, philology, folk-lore, folk psychology and the study of religion. You will not be surprised to hear that a publication has sprung from psycho-analytic soil, of which the exclusive object is to foster these relations. I refer to *Imago*, first published in 1912 and edited by Hans Sachs and Otto Rank. In its relation to all these other subjects psycho-analysis has in the first instance given rather than received. True, analysis reaps the advantage of receiving confirmation of its own results, seemingly so strange, again in other fields; but on the whole it is psycho-analysis which supplies the technical methods and the points of view, the application of which is to prove fruitful in these other provinces. The mental life of the human individual yields, under psycho-analytic investigation, explanations which solve many a riddle in the life of the masses of mankind or at any rate can show these problems in their true light.

I have still given you no idea of the circumstances in which we may arrive at the deepest insight into that hypothetical *primordial language* or of the province in which it is for the most part retained. As long as you do not know this you cannot appreciate the true significance of the whole subject. I refer to the province of neurosis; the material is found in the symptoms and other modes of expression of nervous patients, for the explanation and treatment of which psycho-analysis was indeed devised.

My fourth point of view takes us back to the place from which we started and leads into the track we have already marked out. We said that even if there were no dream-censorship we should still find it difficult to interpret dreams, for we should then be confronted with the task of translating the symbolic language of dreams into the language of waking life. Symbolism, then, is a second and independent factor in dream-distortion, existing side by side with the censorship. But the conclusion is obvious that it suits the censorship to make use of symbolism, in that both serve the same purpose: that of making the dream strange and incomprehensible.

Whether a further study of the dream will not introduce us to yet another contributing factor in the distortion, we shall soon see. But I must not leave the subject of dream-symbolism without once more touching on the puzzling fact that it has succeeded in rousing such strenuous opposition amongst educated persons, although the prevalence of symbolism in myth, religion, art and language is beyond all doubt. Is it not probable that, here again, the reason is to be found in its relation to sexuality?

ELEVENTH LECTURE

The Dream-Work

When you have successfully grasped the dream-censorship and symbolic representation, you will not, it is true, have mastered dream-distortion in its entirety, but you will nevertheless be in a position to understand most dreams.

To do so you will make use of the two complementary methods you will call up the dreamer s associations till you have penetrated from the substitute to the thought proper for which it stands and you will supply the meaning of the symbols from your own knowledge of the subject We will speak later of certain doubtful points which may arise in the process

We can now return to a task which we attempted earlier with inadequate equipment when we were studying the relations between dream elements and the thoughts proper underlying them We then determined the existence of four such main relations substitution of the part for the whole hints or allusions symbolic connection and plastic word representation (images) We will now try to deal with this subject on a larger scale by a comparison of the *manifest* dream content as a whole with the *latent* dream as laid bare by our interpretation

I hope you will never again confuse these two things If you succeed in distinguishing between them you will have advanced further towards an understanding of dreams than in all probability most of the readers of my *Interpretation of Dreams* have done [illegible]

[illegible] cess which seeks to progress from the manifest to the latent thoughts is our work of interpretation the work of interpretation therefore aims at demolishing the dream work In dreams of the infantile type in which the obvious wish fulfilments are easily recognized the process of dream work has nevertheless been operative to some extent for the wish has been transformed into a reality and usually the thoughts also into visual images Here no interpretation is necessary we only have to retrace both these transformations The further operations of the dream work as seen in the other types of dreams we call *dream distortion* and here the original ideas have to be restored by our interpretative work

Having had the opportunity of comparing many dream interpretations I am in a position to give you a comprehensive account of the manner in which the dream work deals with the material of the latent dream thoughts But please do not expect to understand too much it is a piece of description which should be listened to quietly and attentively

The first achievement of the dream work is CONDENSATION by this term we mean to convey the fact that the content of the manifest dream is less rich than that of the latent thoughts is as it were a kind of abbreviated translation of the latter Now and again condensation may be lacking but it i present as a rule and is often carried to a very high degree It never works in the opposite manner i e it never happens that the manifest dream is wider in range or richer in content than is the latent dream Condensation is accomplished in the following ways (1) certain latent elements are altogether omitted (2) of many complexes in the latent dream only a fragment passes over into the manifest content (3) latent elements sharing some common characteristic are in the manifest dream put together blended into a single whole

If you prefer to do so you can reserve the term condensation for this last process the effects of which are particularly easy to demonstrate Taking your own dreams you will be able without any trouble to recall instances of the condensation of different persons into a single figure Such a composite figure resembles A in appearance but is dressed like B pursues some occupation which recalls C and yet all the time you know that it is really D The composite picture serves of course to lay special emphasis upon some characteristic common to the four people And it is possible also for a composite picture to be formed with objects or places as with persons provided only that the single objects or places have ome common attribute upon which the latent dream lays stress It is as though a new and fugitive concept were formed of which the common attribute is the kernel From the superimposition of the separate parts which undergo condensation there usually results a blurred and indistinct picture as if several photographs had been taken on the same plate

The formation of such composite figures must be of great importance in the dream work for we can prove that the common properties necessary to their formation are purposely manufactured where at first sight they would seem to be lacking as for example by the choice of some particular verbal expression for a thought We have already met with instances of condensation and composite formation of this sort they played an important part in originating many slips of the tongue You will remember the case of the young man who wished to insort a lady (*beleidigen* = insult *begleiten* = escort composite word *begleidigen*) Besides there are jokes in which the

technique is traceable t c ndensat on of this sort. Apart from this however we may en ture to as.ert that this process is s mething quite unusual a d strange It is true that in ma y a creation of phantasy we meet with counterparts to th formation f the compos te perso s of o r dreams mpo e t parts wh ch do t belong t ne an the n reality be ng readily united into a single wh l by phantasy as, f instance in the cent urs and fabul us a.imals of ancient mythol gy r of Boecklin s pictures. *C e t ve phantasy* can in fa t m ent othing ew but can only ut up elements from different o es But the peculiar thing about the way in which the dream w k p o ceeds is this ts material onsi.ts of thou.hts, som of which may be bjectionable and disagreeable b t which nevertheless are correctly f rmed a d expres ed The dream work transmutes these thou.hts int another form and t is curious nd inc mprehensible that in th s process f tran lati n—of endering them as it were into n ther script o language—the means of ble ding and c mbining are emplo ed. The tran.lat r e dea o i ther cases m t surely be to respect the distinct ons bserved in the text and especially to different ate be tween things which are milar but n t th same the dream w k on the co trary tri es t ondense two differe t th ughts by lecting after the mann of wit an ambigu s w rd which can suggest both tho ght We mu t ot expect to und rstand this characterist c straight away but t may a.sum gre t significance f r our con eption f the dre m wo k

Althou.h ond nsat on rend rs the dream bscure yet t doe n t g ve th mpress f

manifest elements Again when we come to interpret dreams we see that the associations to a single manifest element do not commo ly make their appearance in orderly success on we often ha e to wait until we have the int r pretation of the whole dream.

The dream work, then follows a very un usual mode of transcript on for the dream tho ghts not a tran.lation word for wo d, or gn fo sign nor yet a process of select on acco ding to s me defin te rule for instance as though the c nsonants only of the words were reproduced a d the vowels omitted nor again what on m ht call a proce s of representation one element being always p cked out to represent several others It works by a different and much more complicated method

The second ach evement of the dream wo k is DIS LACEMENT Fortunately here we are not breakin pe fectly f esh ground indeed we know that it is e ti ely the work of the dream ensorsh p D splacement takes two forms first a latent element may be *replaced* not by a part

we gi ing th dream fore gn appearance

Substitutio by allu on is familiar to us in ou waki g th ughts also but with a differen e f it s essential in th latter that the allus on should be as ly comp ehens bl a d that the co te t of the sub titute should be sociated to that of th thou ht proper Allus on is also frequ ntly mployed in wit where the con diti of ociati n in ontent is di pensed w th and epl ced by unfamiliar external assoc ations s h as similarity of sound, am

lat t trains f thou ht to be united in a gle manifest dream so that w arri e t an pparently dequate interpretat on f a d eam and yet look s cond poss ble meaning

M reove one of th ff cts f o d sation upo th relation.hip betwee the man fest a d the la ent d eam is th t th ect be t een th l ment of the and f the the owhe rema mple on fo by ki d f interla in a manifest leme t repr sents simultaneo sly several latent es and con versely latent thou ht may ent r int se eral

allus by di.plac m nt i unrestri t d by eith r l mitation It is c nn cted most uper ficially d m t rem tely w th th element fo whi h t stands d for that reason s n t readily *mp h s bl* and when the connec ti tra d the int rpretati n gives the mp ss *of* an unsucces f l joke of *for ed* f r f tched and *d gg d in* xplanati n. Th bj ct of th dream-cens rship is only obtained when t has succ ed d in making it impo sibl t tra the th u.ht prope ba k from th allus on.

Displacement of accent is not a legitimate device if our object be the expression of thought though we do sometimes admit it in waking life in order to produce a comic effect I can to some extent convey to you the impression of confusion which then results by reminding you of an anecdote according to which there was in a certain village a smith who had committed a capital offence The court decided that the smith was guilty but since he was the only one of his trade in the village and therefore indispensable whereas there were three tailors living there one of these three was hanged in his place!

The third achievement of the dream work is the most interesting from the psychological point of view It consists in the transformation of thoughts into *visual images* Let us be quite clear that not everything in the dream thou hts is thus transformed much keeps its original form and appears also in the manifest dream as thought or knowledge on the part of the dreamer again translation of them into visual images is not the only possible transformation of thoughts But it is nevertheless the essential feature in the formation of dreams and as we know this part of the dream work is if we except one other case the least subject to variation for single dream elements moreover *plastic word representation* is a process already familiar to us

Obviously this achievement is by no means an easy one In order to get some idea of its difficulty ima ine that you had undertaken to replace a political leading article in a newspaper by a series of illustrations you would have to abandon alphabetic characters in favour of hieroglyphics The people and concrete objects mentioned in the article could be easily represented perhaps even more satisfactorily in pictorial form but you would expect to meet with difficulties when you came to the portrayal of all the abstract words and all those parts of speech which indicate relations between the various thoughts e g particles conjunctions and so forth With the abstract words you would employ all manner of devices for instance you would try to render the text of the article into other words more unfamiliar perhaps but made up of parts more concrete and therefore more capable of such representation This will remind you of the fact that most abstract words were originally concrete their original significance having faded and therefore you will fall back on the original concrete meaning of these words wherever possible So you will be glad that you can represent th possessing of an object as a literal physical *sitting upon* it (possess=*potis+sedeo*) This is just how the dream work proceed In such circumstances you can hardly demand gre accuracy of representation neither will you quarrel with the dream work for replacing an element which is difficult to reduce to pictorial form such as the idea of breakin marria vows by some other kind of breaking e that of an arm or leg In this way you will to som extent succeed in overcoming the awkwardness of rendering alphabetic characters into hieroglyphs

When you come to represent those parts of speech which indicate thou ht relations e g *because therefore but* and so on you have no such means as those described to assist you so that the e parts of the text must be lost so far as your translation into pictorial form is concerned Similarly the content of the dream

themes is resolved by the dream work into its raw material consisting of objects and activities. You may be satisfied if there is any possibility of indicating somehow by a more minute elaboration of the images certain relations which cannot be represented in themselves. In a precisely similar manner the dream work succeeds in expressing much of the content of the latent thoughts by means of peculiarities in the *form* of the manifest dream, by its distinctness or obscurity, its division into various parts, etc. The number of parts into which a dream is divided corresponds as a rule with the number of its main themes, the successive trains of thought in the latent dream; a short preliminary dream often stands in an introductory or causal relation to the subsequent detailed main dream, while a subordinate dream thought is represented by the interpolation into the manifest dream of a change of scene and action. The form of dreams, then, is by no means unimportant in itself and itself demands interpretation. Several dreams in the same night often have the same meaning and indicate an endeavour to control more and more completely a stimulus of increasing urgency. In a single dream a specially difficult element may be represented by doublings, i.e., by more than one symbol.

If we continue the comparison of dream thoughts with the manifest dreams representing them, we discover in all directions things we would never have expected, e.g. that even nonsense and absurdity in dreams have their meaning. In fact at this point the contrast between the medical and the psycho-analytic view of dreams becomes more marked than ever before. According to the medical view the dream is absurd because while dreaming our mental activity has renounced its functions; according to our view, on the other hand, the dream becomes absurd when it has to represent a criticism implicit in the latent thoughts—the opinion: It is absurd. The dream I *told you*, about the visit to the theatre (three tickets for one florin and a half) is a good example of this. The opinion thus expressed was as follows: It was *absurd* to marry so early.

Similarly we find out when we interpret dreams what is the real meaning of the doubts and uncertainties so frequently mentioned by dreamers whether a certain element did actually appear in the dream, whether it was really this and not rather something else. As a rule there is nothing in the latent thoughts corresponding with these doubts and uncertainties; they originate wholly through the operation of the censorship and are comparable to a not entirely successful attempt at erasure.

One of our most surprising discoveries is the manner in which opposites in the latent dream are dealt with by the dream work. We know already that points of agreement in the latent material are replaced by condensation in the manifest dream. Now contraries are treated in just the same way as similarities, with a marked preference for expression by means of the same manifest element. An element in the manifest dream which admits of an opposite may stand simply for itself or for its opposite, or for both together; only the sense can decide which translation is to be chosen. It accords with this that there is no representation of a No in dreams, or at least none which is not ambiguous.

A welcome analogy to this strange behaviour of the dream work is furnished in the development of language. Many philologists have maintained that in the oldest languages opposites such as strong—weak, light—dark, large—small, were expressed by the same root word (*the antithetical sense of primal words*). Thus in old Egyptian *ken* stood originally for both strong and weak. In speaking, misunderstanding was guarded against in the use of such ambivalent words by the intonation and accompanying gestures; in writing, by the addition of a so-called determinative, that is to say of a picture which was not meant to be expressed orally. Thus *ken* = strong was written in such a way that after the letters there was a picture of a little man standing upright; when *ken* meant "weak," there was added the picture of a man in a slack, crouching attitude. Only at a later period did the two opposite meanings of the same primal word come to be designated in two different ways by slight modifications of the original. Thus from *ken* meaning strong—weak were derived *two words*: *ken* = strong, and *kan* = "weak." Nor is it only the oldest languages, in the last stages of their development, which have retained many survivals of these early words capable of meaning either of two opposites, but the same is true of much younger languages, even those which are today still living. I will quote some illustrations of this taken from the work of C. Abel (1884).

In Latin, such ambivalent words are *altus* = high—deep, *sacer* = sacred or accursed.

As examples of modifications of the original root, I quote

clamare = to shout *clam* = quietly silently secretly
siccus = dry *succus* = juice

and in German *Stimme* = voice *stumm* = dumb

A comparison of kindred languages yields a large number of examples

English lock = to shout German *Loch* = hole *Lucke* = gap
English cleave German *kleben* = to stick adhere

The English word without originally carrying with it both a positive and a negative connotation is today used in the negative sense only but it is clear that with has the signification not merely of adding to but of depriving of from the compounds with draw withhold (cf the German *wieder*)

Yet another peculiarity of the dream work has its counterpart in the development of language In ancient Egyptian as well as in other later languages the sequence of sounds was transposed so as to result in different words for the same fundamental idea Examples of this kind of parallels between English and German words may be quoted

Topf (pot)—pot Boat—tub Hurry—*Ruhe* (rest)
Balken (beam)—*Kloben* (club) wait—*tauwen* (to wait)

Parallels between Latin and German

capere—*packen* (to seize) *ren*—*Niere* (kidney)

Such transpositions as have taken place here in the case of single words are made by the dream work in a variety of ways The inversion of the meaning i e substitution by the opposite is a device with which we are already familiar but besides this we find in dreams inversion of situations or of the relations existing between two persons as though the scene were laid in a topsy turvy world In dreams often enough the hare chases the hunter Again inversion is met with in the sequence of events so that in dreams cause follows effect which reminds us of what sometimes happens in a third rate theatrical performance when first the hero falls and then the shot which kills him is fired from the wings Or there are dreams in which the whole arrangement of the elements is inverted so that in interpreting them the last must be taken first and the first last in order to make sense at all You remember that we also found this in our study of dream symbolism in which the act of plunging or falling into water has the same meaning as that of emerging from water namely giving birth or being born and going up steps or a ladder means the same as coming down them We can not fail to recognize the advantage reaped for dream distortion by this freedom from restrictions in representing the dream thoughts

These features of the dream work may be termed *archaic* They cling to the primitive modes of expression of languages or scripts and yield the same difficulties which we shall touch upon later in the course of some critical observations on this topic

Now let us consider some other aspects of the subject Clearly what has to be accomplished by the dream work is the transformation of the latent thoughts as expressed in words into perceptual forms most commonly into visual images Now our thoughts originated in such perceptual forms their earliest material and the first stages in their development consisted of sense impressions or more accurately of memory pictures of these It was later that words were attached to these pictures and then connected so as to form thoughts So that the dream work subjects our thoughts to a *regressive* process and retraces the steps in their development in the course of this regression all new acquisitions won during this development of memory pictures into thoughts must necessarily fall away

This then is what we mean by the dream work Besides what we have learnt of its processes our interest in the manifest dream is bound to recede far into the background I will however devote still a few more remarks to the manifest dream for after all that is the only part of the dream with which we have any direct acquaintance

It is natural that the manifest dream should lose some of its importance in our eyes It must strike us as a matter of indifference whether it is carefully composed or split up into a succession of disconnected pictures Even when the outward form of the dream is apparently full of meaning we know that this appearance has been arrived at by the process of dream-distortion and can have as little organic connection with the inner content of the dream as exists between the *façade* of an Italian church and its general structure and ground plan At times however this *façade* of the dream has a

B th es of cl e t ll al E gl h t cl e (= sep te) d t cl t (= db) —TR.

means too reproduces an important part of the latent thoughts with little or no distortion. But we cannot know this until we have interpreted the dream and thus arrived at an opinion with regard to the degree of distortion present. A similar doubt obtains where two elements seem to be closely connected; such connection may contain a valuable hint that the corresponding elements in the latent dream are similarly related, but at other times we can convince ourselves that what is connected in thought has become widely separated in the dream.

In general we must refrain from attempting to explain one part of the manifest dream by another part, as though the dream were a coherent conception and a pragmatic representation. It is in most cases comparable rather to a piece of Breccia stone composed of fragments of different kinds of stone cemented together in such a way that the markings upon it are not those of the original pieces contained in it. There is, as a matter of fact, one mechanism in the dream work, known as secondary elaboration, the object of which is to combine the immediate results of the work into a single and fairly coherent whole; during this process the material is often so arranged as to give rise to total misunderstanding, and for this purpose any necessary interpolations are made.

On the other hand, we should not overrate the dream work or attribute to it more than is its due. Its activity is limited to the achievements here enumerated: condensation, displacement, plastic representation and secondary elaboration of the whole dream; these are all that it can effect. Such manifestations of judgment, criticism, surprise or deductive reasoning as are met with in dreams are not brought about by the dream work and are only very rarely the expression of subsequent reflection about the dream; but are for the most part fragments of the latent thoughts introduced into the manifest dream with more or less modification and in a form suited to the context. Again, the dream work cannot create conversation in dreams; save in a few exceptional cases it is imitated from, and made up of, things heard or even said by the dreamer himself on the previous day which have entered into the latent thoughts as the material or incitement of his dream. Neither do mathematical calculations come into the province of the dream work; anything of the sort appearing in the manifest dream is generally a mere combination of numbers, a pseudo-calculation, quite absurd as such and again only a copy of some calculation comprised in the latent thoughts. In these circumstances it is not surprising that the interest which was felt in the dream work soon becomes directed instead toward the la

... themselves in a

a

theoretical consideration of them by letting our interest stray so far that we altogether substitute the latent thoughts for the dream as a whole and make some pronouncement on the latter which is only true of the former. It is strange that the findings of psycho-analysis could be so misused as to result in confusion between the two. The term *dream* can only be applied to the *results of the dream work*, i.e. to the *form* into which the latent thoughts have been rendered by the dream work.

This work is a process of a quite peculiar type; nothing like it has hitherto been known in mental life. This kind of condensation, displacement, and regressive translation of thoughts into images is a novelty, the recognition of which in itself richly rewards our efforts in the field of psycho-analysis. You will again perceive from the parallels to dream work the connections revealed between psycho-analytic and other research, especially in the fields of the development of speech and thought. You will only realize the further significance of the insight so acquired when you learn that the mechanism of the dream work is a kind of model for the formation of neurotic symptoms.

I know too that it is not possible for us yet

—if this indeed is the nature of the latent dream thoughts—and to the promise dream interpretation gives of an approach, wider than we ever guessed it, to the knowledge of the unconscious life of the mind.

Now however I think the time has come to give you individual examples of various short dreams which will illustrate the points for which I have already prepared you.

TWELFTH LECTURE

Examples of Dreams and Analysis of Them

You must not be disappointed if I present you once more with *fragments* of dream interpretations, instead of inviting you to participate in the interpretation of one fine long dream. You

clamare=to shout *clam*=quietly silently secretly

siccus=dry *succus*=juice

and in German *Stimme*=voice *stumm*=dumb

A comparison of kindred languages yields a large number of examples

English lock=to shut German *Loch*=hole *Lucke*=gap

English cleave German *kleben*=to stick adhere

The English word without originally carrying with it both a positive and a negative connotation is today used in the negative sense only but it is clear that with has the signification not merely of adding to but of depriving of from the compounds with draw withhold (cf the German *wieder*)

Yet another peculiarity of the dream work has its counterpart in the development of language In ancient Egyptian as well as in other later languages the sequence of sounds was transposed so as to result in different words for the same fundamental idea Examples of this kind of parallels between English and German words may be quoted

Topf (pot)—pot Boat—tub Hurry—*Ruhe* (rest)

Balken (beam)—*Kloben* (club) wait—*tauen* (to wait)

Parallels between Latin and German

capere—*packen* (to seize) *ren*—*Niere* (kidney)

Such transpositions as have taken place here in the case of single words are made by the dream work in a variety of ways The inversion of the meaning i e substitution by the opposite is a device with which we are already familiar but besides this we find in dreams inversion of situations or of the relations existing between two persons as though the scene were laid in a topsy turvy world In dreams often enough the hare chases the hunter Again inversion is met with in the sequence of events so that in dreams cause follows effect which reminds us of what sometimes happens in a third rate theatrical performance when first the hero falls and then the shot which kills him is fired from the wings Or there are dreams in which the whole arrangement of the elements is inverted so that in interpreting them the last must be taken first and the first last in order to make sense at all You remember that we also found this in our study of dream symbolism in which the act of plunging or falling into water has the same meaning as that of emerging from water namely giving birth or being born and going up steps or a ladder means the same as coming down them We cannot fail to recognize the advantage reaped for dream-distortion by this freedom from restrictions in representing the dream thoughts

These features of the dream work may be termed *archaic* They cling to the primitive modes of expression of languages or scripts and yield the same difficulties which we shall touch upon later in the course of some critical observations on this topic

Now let us consider some other aspects of the subject Clearly what has to be accomplished by the dream work is the transformation of the latent thoughts as expressed in words into perceptual forms most commonly into visual images Now our thoughts originated in such perceptual forms their earliest material and the first stages in their development consisted of sense impressions or more accurately of memory pictures of these It was later that words were attached to these pictures and then connected so as to form thoughts So that the dream work subjects our thoughts to a *regressive* process and retraces the steps in their development in the course of this regression all new acquisitions won during this development of memory pictures into thoughts must necessarily fall away

This then is what we mean by the dream work Besides what we have learnt of its processes our interest in the manifest dream is bound to recede far into the background I will however devote still a few more remarks to the manifest dream for after all that is the only part of the dream with which we have any direct acquaintance

It is natural that the manifest dream should lose some of its importance in our eyes It must strike us as a matter of indifference whether it is carefully composed or split up into a succession of disconnected pictures Even when the outward form of the dream is apparently full of meaning we know that this appearance has been arrived at by the process of dream-distortion and can have as little organic connection with the inner content of the dream as exists between the *façade* of an Italian church and its general structure and ground plan At times however this *façade* of the dream has a

Both senses of cleave [illegible] till [illegible] E[illegible] lea[illegible] (=separate) [illegible] cle[illegible] (= [illegible]) —TR.

and our task in interpreting is to reinsert these connections which have been omitted.

2. My writings on the subject of dreams have placed me to some extent in the position of public consultant on the question and for many years now I have received letters from the most diverse quarters communicating dreams to me or asking for my opinion. Naturally I am grateful to all those who have given me sufficient material with their dreams to make an interpretation possible or have themselves volunteered one. The following dream of a medical student in Munich dating from 1910 belongs to this category and I quote it because it may prove to you how hard it is generally speaking to understand a dream until the dreamer has given us what information he can about it. For I have a suspicion that in the bottom of your hearts you think that the translation of the symbols is the ideal method of interpretation and that you would like to discard that of free association. I want therefore to clear your minds of so pernicious an error.

July 13th, 1910. Towards morning I had the following dream: *I was bicycling down a street in Tübingen when a brown dachshund came running after me and caught hold of one of my heels. I rode a little further and then dismounted, sat down on a step and began to beat the creature off for it had set its teeth in my heel.* (The dog's biting me and the whole scene roused no unpleasant sensations.) *Two elderly ladies were sitting opposite watching me with grinning faces. Then I woke up, and, as has frequently happened before, with the transition to waking consciousness the whole dream was clear to me.*

In this instance symbolism cannot help us much, but the dreamer goes on to tell us: "I recently fell in love with a girl, just from seeing her in the street, but I had no means of introduction to her. I should have liked best to make her acquaintance through her dachshund, for I am a great animal-lover myself and was attracted by seeing she was one too." He adds that several times he had separated fighting dogs very skilfully, often to the amazement of the onlookers. Now we learn that the girl who has taken his fancy was always seen walking with this particular dog. She however has been eliminated from the manifest dream; only the dog associated with her has remained. Possibly the elderly ladies who grinned at him represented her, but the rest of what he tells us does not clear up this point. The fact that he was riding a bicycle in the dream was a direct repetition of the situation as he remembered it, for he had not met the girl with the dog except when he was bicycling.

3. When a man has lost someone dear to him, for a considerable period afterwards he produces a special type of dream in which the most remarkable compromises are effected between his knowledge that that person is dead and his desire to call him back to life. Sometimes the deceased is dreamt of as being dead, and yet still alive because he does not know that he is dead, as if he would only really die if he did know it; at other times he is half dead and half alive and each of these conditions has its distinguishing marks. We must not call these dreams merely nonsensical, for to come to life again is no more inadmissible in dreams than in fairy-tales in which it is quite a common fate. As far as I have been able to analyse such dreams, it appeared that they were capable of a reasonable explanation, but that the pious wish to recall the departed is apt to manifest itself in the strangest ways. I will submit a dream of this sort to you which certainly sounds strange and absurd enough, and the analysis of which will demonstrate many points already indicated in our theoretical discussions. The dreamer was a man who had lost his father some years previously.

My father was dead, but had been exhumed and looked ill. He went on living, and I did all I could to prevent his noticing it. Then the dream goes on to other matters apparently very remote.

That the father was dead we know to be a fact, but the exhumation had not taken place in reality; indeed the question of real fact has nothing to do with anything that follows. But the dreamer went on to say that after he returned from his father's funeral one of his teeth [illegible]

was not the way to treat a tooth; one must have patience with it. I will put something in it," he said, "to kill the nerve and you must come back in three days time when I will take it out again." "This 'taking out,'" said the dreamer suddenly, "is the exhuming."

Now was he right? True the parallel is not exact, for it was not the tooth which was taken out but only a dead part of it. As a result of experience however we can well credit the dream work with inaccuracies of this sort. We

will say that after so much preparation you surely have a right to expect that and you will express your conviction that after successful interpretations of so many thousands of dreams it should long ago have been possible to collect a number of striking examples by which the truth of all our assertions about the dream work and dream thoughts could be demonstrated Yes but there are too many difficulties in the way of fulfilling this wish of yours

In the first place I must confess that there is nobody who makes the interpretation of dreams his main business In what circumstances then do we come to interpret them? At times we may occupy ourselves for no particular purpose with the dreams of a friend or we may work out our own dreams over a period of time in order to train ourselves for psycho analytic work but chiefly we have to do with the dreams of nervous patients who are undergoing psycho analytic treatment These last dreams provide splendid material and are in no respect inferior to those of healthy persons but the technique of the treatment obliges us to subordinate dream interpretation to therapeutic purposes and to desist from the attempt to interpret a large number of the dreams as soon as we have extracted from them something of use for the treatment Again many dreams which occur during the treatment elude full interpretation altogether since they have their ori in in the whole mass of material in the mind which is as yet unknown to us it is not possible to understand them until the completion of the cure To relate such dreams would necessarily involve revealing all the secrets of a neurosis this will not do for us since we have taken up the problem of dreams in preparation for the study of the neuroses

Now I expect you would willingly dispense with this material and would prefer to listen to the explanation of dreams of healthy persons or perhaps of your own But the content of these dreams makes that impossible One cannot expose oneself nor anyone whose confidence has been placed in one so ruthlessly as a thorough interpretation of a dream would necessitate for as you already know they touch upon all that is most intimate in the personality Apart from the difficulty arising out of the nature of the material there is another difficulty as regards relating the dreams You are aware that the dream seems foreign and strange to the dreamer himself how much more so to an outsider to whom his personality is unknown The literature of psycho analysis shows no lack of good and detailed dream analyses I myself have published some which formed part of the history of certain pathological cases Perhaps the best example of a dream interpretation is that published by O Rank consisting of the analysis of two mutually related dreams of a young girl These cover about two pa es of print while the analysis of them runs into 76 pages It would need almost a whole term s lectures in order to take you through a work of this magnitude If we selected some fairly long and considerably distorted dream we should have to enter into so many explanations to adduce so much material in the shape of associations and recollections and to go down so many sidetracks that a single lecture would be quite inadequate and would give no clear idea of it as a whole So I must ask you to be content if I pursue a less difficult course and relate some fragments from dreams of neurotic patients in which this or that isolated feature may be recognized Symbols are the easiest features to demonstrate and after them certain peculiarities of the regressive character of dream representation I will tell you why I regard each of the following dreams as worth relating

1 A dream consistin only of two short pictures *The dreamer s uncle was smoking a cigarette although it was Saturday A woman was fondling and caressing the dreamer as though he were her child*

With reference to the first picture the dreamer (a Jew) remarked that his uncle was a very pious man who never had done and never would do anything so sinful as smokin on the Sabbath The only association to the woman in the second picture was that of the dreamer s mother These two pictures or thoughts must obviously be related to one another but in what way? Since he expressly denied that his uncle would in reality perform the action of the dream the insertion of the conditional *if* will at once suggest itself If my uncle that deeply religious man were to smoke a cigarette on the Sabbath then I myself might be allowed to let my mother fondle me Clearly that is as much as to say that being fondled by the mother was something as strictly forbidden as smoking on the Sabbath is to the pious Jew You will remember my telling you that in the dream work all relations among the dream thoughts disappear the thoughts are broken up into their raw material

: and our task in m erpret..., is to reinsert these connections which have been omi ted.

cur ons. The dreamer was a man who had lost his father som years previously

My f her was d ... but had been exhum d ... I ... ed ill He wen on living and I did all I could t prevent his ... t Then the dream goes on to other matters apparently very rem e.

That the father was dead we know to be a f ct but th exhumation had no taken place in reality indeed the question of real fact has nothing t do with an thing that follows. But the dreamer wen on t say that af er he returned from his f her s funeral one of his teeth began to ache H wanted to treat t according to the Jewish precept If thy tooth offend thee, pluck t out, and accordingly went to the dentist. The latt however said that that was n the way to treat tooth one must have patience with t. I will put something in it, he said, "to kill the nerve, and you must come back in three da tim when I will take t out again. "This 'taking out, said the dreamer suddenly "is the exhuming"

Now was he right True the para... l is not exact, for it was n t the tooth which was taken out but only a dead part f ... As result of experience, however we can well credit the dream work with inaccuracies of this sort. We

must suppose that the dreamer had by a process of condensation combined the dead father with the tooth which was dead and which he yet retained No wonder then that an absurdity was the result in the manifest dream for obviously not all that was said about the tooth could apply to the father What then are we to regard as the *tertium comparationis* between the father and the tooth what common factor makes the comparison possible?

Such a factor must have existed for the dreamer went on to observe that he knew the saying that if one dreams of losing a tooth it means that one is about to lose a member of his family

We know that this popular interpretation is incorrect or at least correct only in a very distorted sense We shall therefore be the more surprised actually to discover the subject thus touched upon behind the other elements of the dream content

Without being pressed further the dreamer then began to talk of his father s illness and death and of the relations which had existed between father and son The illness had been a long one and the care and

that

on h

and on his strict observance of the Jewish law Does not a certain contradiction strike us here in the thoughts relating to the dream? He had identified the tooth with the father He wanted to treat the former according to the Jewish law which commanded that a tooth which causes pain and annoyance should be plucked out His father he also wanted to treat according to the precepts of the law but here the command was that he must pay no heed to expense and annoyance must take the whole burden upon himself and not allow any hostile intention to arise against the cause of the trouble Would not the agreement between the two situations be much more convincing if he had really gradually come to have the same feelings towards his sick father as he had towards his diseased tooth that is to say if he had wished for death to put a speedy end to his father s superfluous painful and costly existence?

I have no doubt that this was in reality his attitude towards his father during the protracted illness and that his ostentatious assertions of filial piety were designed to divert his mind from any recollections of the sort Under conditions such as these it is no uncommon thing for the death wish against the father to be roused and to mask itself with some ostensibly compassionate reflection such as It would be a blessed release for him But I want you particularly to notice that here in the latent thoughts themselves a barrier has been broken down The first part of the thoughts was we may be sure only temporarily unconscious that is during the actual process of the dream work the hostile feelings towards the father on the other hand had probably been permanently so possibly dating from childhood and having at times during the father s illness, crept as it were timidly and in a disguised form into consciousness We can maintain this with even greater certainty of other latent thoughts which have unmistakably contributed to the content of the dream There are it is true no indications in it of hostile feelings toward the father but when we enquire into the origin of such hostility in the life of the child we remember that fear of the father arises from the fact that in the earliest years of life it is he who opposes the sexual activity of the boy as he is usually compelled to do again after puberty from motives of social expediency This was the relation in which our dreamer stood to his father his affection for him had been tinged with a good deal of respect and dread the source of which was early sexual intimidation.

We can now explain the further phrases in the dream from the onanism complex *He looked ill* was an allusion to another remark of the dentist s—that it did not look well for a tooth to be missing just there—but it also refers at the same time to the *looking ill* by which the young man during the period of puberty betrays or fears lest he might betray his excessive sexual activity It was with a lightening of his own heart that in the manifest dream the dreamer transferred the look of illness from himself to his father an inversion with which you are familiar as a device of the dream work *He went on living* accords both with the wish to recall the father to life and the promise of the dentist to save the tooth. The phrase *I did everything I could to prevent his noticing* is extremely subtly designed to lead us to complete it with the words that he was dead The only completion of them that really makes sense however is again to be traced to the onanism complex where it is a matter of course that the young man should do all he can to conceal his sexual life from his father Finally I would remind you that the

so-called "tooth ache dreams always refer to on..ism and the pun hment for it that is feared.

You see how this incomprehens'ble dream is bu.t up by a p ce of remarkabl and mi lead ng co densat o by om ttin from t all the thou.ht that belon to the c re of th latent trai f thought a d by the creation of amb guous bstitute formations to represent those tho hts whi h were deepest and most rem e in time.

4. We ha e alre dy tried repeat dly to get to the bottom of th e prosaic and banal d eams hich have othin ab urd o strange in th m but which ugge t th qu tion Why should we dream bo t s ch tri l tes t all I w'll t. refore qu te a fresh example f thi rt in the hape of three dreams conne ted with o e an ther a d dreamt by a young lady in the course of a sin le n ght

( ) She was goi g th o gh the h ll in he k us c d s ruck her he d on a low h ging cham' er with such f c as to d aw blood Th ep sode d d t rem nd her f a thing t.at had ct ally happened he remarks led in qui another d rect You kn w how ter ribly my ha is coming t W ll terday my mother said t m My d child if it goes like thi your h ad will oon be s bald s ou b tt cks. W ee here that the h ad stands f th ther e d of the body N fur th a s tance is required t und rsta d the symbolism f th chand lie all by ts c pa bl f l matio re mbols f the male o gan. The real s bject of th dream then a bleedir t th l we end of the body aused by tact with th pen s Thi might till ha e othe meanings th dreamer further as oc t on h w that th dream has t do with the beli f that m n.truat results from sexual terc rse with man a t on bout exu l m tt wh h s b o m ns u comm n mongst immat e gi l

(b Th d mer aw tr yard a deep k wh k k k ew h d b en c is d by the r t g f t H rem k this point was th t the t ee wa m si g me ning that he did t see the tree in the dre m but th sam thra e serves t express a other th ht .u h lea es us d bt t th symbolic erpre.at n. Th dream refers t an the f l t on the bject f se t th be h f that gi ls m ll had the m gen tal ra bo s d that th lat onf rmatio f th rga has been b ught bo t by c stra ti (uproot g th tree)

(c) The dreamer was standing in front of he writ g table d awer wh ch she k ows so well that if a yo e to ched it she wo ld im med ately be aware of it The writing table drawer like ll drawers chest and boxes is a symbol of the female genital. She knew that when sexual intercourse (or as she thou ht any contact at all) has t ken place the genital hows certa n indications of the fact and she had lo g had a fear of bein co cted of this I think that in all three dreams the main empha s lies on th idea of *k owing* She had in mind th time of childi h in estigations into exual matters of the results of which she had been very proud t the time

Here is an th r example of symbolism. But this time I must preface it with a hort account of the me tal s tuat on in which the dream occurred A man and a woman who were i love had spent a night togeth he described her ture as maternal she was one of those women wh se des re t have a child comes out irresist'bly d ring caresses The cond t ons of th meeting however mad it necessary to t k precaution to prevent the semen from e tering the womb On wakin the next morn ing the woman related the following dream

An fficer with a ed cap was purs g her the st et She fled f om h m and a up the staircas with h m after her B eathl s she each d her oms a d slammed and lo k d the d o behind her The man emained o ts d a d peepi g th o gh the keyhol the door sh saw h m sitt g on a bench o t d w epi g

I the p rsu t by the officer with the r d cap and the breathles cl mbin of the sta rs o will ec gnize th repre entat on of the sexual act That the dreamer shut her pursue out may erve as an example of the de ce of in ers o o frequently emplo ed in dream fo in reality t was the man who withdrew before the mpl t n f th xual act In the same w y h has p jected he own feelin f grief on t h r part er f t h wh weep n the d am hi tears at th same time alluding t th s minal fluid

You will certa l ha e heard it sa d at some t me o th r that psycho-analysis mainta that ll dreams ha e a sexual meani You are now in a posit yoursel es to f rm an pinio a t th false ess f this rep oach. Y u ha learnt f w h fulfilment d eams, d h w th th gratificat on f the mo t bvi- us needs—hu th rst and th longi g f r liberty—c mfort-d ms and impatient dreams as w ll as tho e which are frankly

avaricious and egoistical You may however certainly bear it in mind that according to the results of psycho analysis dreams in which a marked degree of distortion is pre ent *mainly* (but here again not exclusively) give expression to sexual desires

6 I have a special motive in giving many instances of the use of symbols in dreams In our first lecture I complained of the difficulty of demonstrating my statements in such a way as to carry conviction with regard to the findings of psycho analysis and since then you have doubtless agreed with me Now the separate propositions of psycho analysis are never theless so intimately related that conviction on a single point easily leads to acceptance of the greater part of the whole theory It might be said of psycho analysis that if you give it your little fin er it will soon have your whole hand If you accept the explanation of errors as satisfactory you cannot logically stop short of belief in all the rest Now dream symbolism provides another equally good approach to such acceptance I will recount to you a dream which has already been published of a woman of the poorer classes whose husband was a watchman and of whom we may be sure that she had never heard of dream symbolism and psycho analysis You can then jud e for yourselves whether the interpretation arrived at with the help of sexual symbols can justly be called arbitrary or forced

Then someone broke into the house and in terror she cried for a watchman But the watchman accompanied by two tramps had gone into a church which had several steps leading up to it Behind the church there was a mountain and up above a thick wood Th watc

had a

had g

y with him had ap ons twisted round their hips like sacks A path led from the church to the mountain and was over grown on both sides with grass and bushes which grew denser and dense and at the top of the mountain there was a regular wood

You will reco nize without any trouble the symbols here employed the male organ is represented by the trinity of *three* persons appearing whilst the female sexual organs are symbolized by a landscape with a chapel a mountain and a wood and once more you have the act of going up steps as symbolic of the sexual act The part of the body called in the dream *a mountain* is similarly termed in anatomy the *mons veneris*

7 I will tell you another dream which is to be explained in the light of symbolism a dream moreover which is noteworthy and convincing from the fact that the dreamer himself translated all the symbols though he brought no previous theoretical knowledge to the interpretation This is a very unusual circumstance and we have no accurate idea of the conditions which give rise to it

He was walking with his father in a pl which must have been the Prater for they saw the Rotunda with a little building in front of it to which was made fast a captive balloon which looked rather slack His father asked him what it was all for the son wondered at his asking but explained it nevertheless Then they came to a cou t yard where a large sheet of metal lay spread out His father wanted to break off a big piece but looked round first in case anyone should notice him He said to his son that all the same he need only tell the o er seer and then he could take it straightaway Some steps led down from this court to a shaft the sides of which were upholstered with some soft stuff something like a leather armchair At the bottom of this shaft was a rather long platform and beyond it another shaft

The following is the dreamer s own interpretation The Rotunda stands for my genitals and the captive balloon in front of it for the penis which I have had to complain of for being limp A more detailed translation would then run thus the rotunda stands for the buttocks (regularly included by children amongst the genitals) the smaller structure in front is the scrotum In the dream his father asks him what all this is i e what are the purpo e and function of the genital To invert this situation so that the son asks the questions is an obvious id a and since these questions were never a ked in reality we must construe the dream thoughts as a wi h or take them in a conditional sense If I had asked my father to expla n The sequel to this thought we hall find pre ently

The court yard where the sheet metal lay is not in the first place to be explained symbolically but is a reference to the father s place of busine s From motives of discretion I have substituted *sheet metal* for the actual material dealt with by him but otherwise I have made no alteration in the words of the dream The dreamer had entered his father s bu iness and had been much scandal zed by the extremely questionable practices upon which the high

profits largely depended Hence the sequel to the dream thou,ht me t o ed above wo ld run (If I had asked him) he w uld ha e dece ed m as h decei es his cu tomers The dreamer himself gi es a seco d explanati n for the pull ing off the p ece of m tal which serves to represent commer al disho e ty it m an he says, the practice of mastu bati n. Not o ly is this an explan ti n with which we ha e long been familia b t it is well cco danc with th mt rp etat n that the s cret practice of ma t b t n h uld be exp essed by the p- posit idea (*W e may do t openly'*) So the fact that this pra tice is imputed to the father as was the que ti ning in the first cene of the *dream is exactly what we should expect* The dreamer immediately interpreted the shaft on a count of the soft uphol t ing of the walls

se d shaft, w explained by th dream r

t

by a f eame with ma k d polyg m us te u encies bec se they m y serve t illustrate the tatement that th dreame s wn person is prese t in ev ry d eam even when t s disguised th manife t o tent The trunks in th dreams re f mal ymbols

(b) A ne t a cust ms hous A fellow- t ller pen d his trunk nd said noncha lantly smok g cig ett Ther is th g t d clare that The cust ms ficial seem d to bel eve him but felt in the trunk aga n and found a st ictly proh b ted art cle The t avel le the said n a resigned way W ell it can t be helped The dreamer himself is the traveller and I am the official He is generally very stra ghtforward with me but had made up his mind to conceal from me a relation which he had recently formed with a lady for he as sumed quite correctly that I knew her He displaces on t a strang r the embarras ing itua t o of being detected so that he himself does not seem to come into the dream at all.

9 Here we have an example of a symbol which I have not y t mentio ed

The d eamer met his sister with two friends who were themselves sisters He sh ok hands with these two b t not with his sister

The e was n real ep sode connected with thi in his mind I tead hi thoughts went back t a time when his bservations led h m to wo d r why a girl s breasts are so late in dev lop ng The two sisters therefore stand for the breasts he would have liked t grasp th m with his hand if only it had not been his ister

10. Here is n example of death symbolism in dreams *The dreame was crossi g a very h gh st ep iron bridge with two people whose names he knew but forgot on w k g Suddenly both of them had v shed and he saw a ghostly ma a cap and an o e all He asked h m whether he were the telegraph messe ger No O the co chma ? No He then went on* and in th d eam had a fe lin f great dread on w king he f llowed t up w th the pha ta y that the iron bridge suddenly broke and that he f ll into the bys

When stres is la d upo the f ct th t people in a dream re unknown to the dreamer or that h has f gotten the r names they are s a rul persons with whom h is ntimately con n cted The dre mer was o e of a family of three hildren f h had e er wi hed f th death f th oth tw t would be ly ju that h sh uld be vi ted w th the f of death W th refer ce to the t legraph messenge h rema k d that they always bring bad new

Uhland s poem of th vo ag of King Ka and recalled a d g ro s sail n lak w tw compan ns when he pl y d the part the kin in the poem The iron bridge sugges

to him a recent accident also the stupid saying Life is a suspension bridge

11 The following may be regarded as another example of a death dream

An unknown gentleman was leaving a black edged visiting card on the dreamer

1 I give another dream which will interest you from several points of view it is to be traced partly however to a neurotic condition in the dreamer

He was in a train which stopped in the open country He thought there was going to be an accident and that he must make his escape so he went through all the compartments killing everyone he met—driver guard and so on

This dream recalls a story told him by a friend On a certain Italian line an insane man was being conveyed in a small compartment but by some mistake a passenger was allowed to get in with him The madman murdered the other traveller Thus the dreamer identified himself with this insane man his reason being that he was at times tormented by an obsession that he must make away with everyone who shared his knowledge Then he himself found a better motivation for the dream The day before he had seen at the theatre a girl he had meant to marry but had given up because she gave him cause for jealousy Knowing the intensity which jealousy could assume in him he would really have been mad to want to marry her That is to say he thought her so unreliable that his jealousy would have led him to murder everyone who got in his way The going through a number of rooms or as here compartments we have already learnt to know as a symbol of marriage (the expression of monogamy according to the rule of opposites)

With reference to the train s stopping in the open country and the fear of an accident he told the following story

Once when such a sudden halt occurred on the line outside a station a young lady who was in the carriage said that perhaps there was going to be a collision and that the best thing to do was to raise the legs high This phrase raise the legs had associations with many walks and excursions into the country which he had shared with the girl mentioned above in the happy early days of their love Here was a new argument for the contention that he would be mad to marry her now nevertheless my knowledge of the situation led me to regard it as certain that there existed in him all the same the desire to fall a victim to this form of madness

THIRTEENTH LECTURE

Archaic and Infantile Features in Dreams

Let us start afresh from our conclusion that under the influence of the censorship the dream work translates the latent dream thoughts into another form These thoughts are of the same nature as the familiar conscious thoughts of waking life the new form in which they are expressed is owing to many peculiar characteristics incomprehensible to us We have said that it goes back to phases in our intellectual development which we have long outgrown—to hieroglyphic writing to symbolic connections possibly to conditions which existed before the language of thought was evolved On this account we called the form of expression employed by the dream work *archaic* or *regressive*

From this you may draw the inference that a more profound study of the dream work must lead to valuable conclusions about the initial stages of our intellectual development of which at present little is known I hope it will be so but so far this task has not been attempted The era to which the dream work takes us back is *primitive* in a two fold sense in the first place it means the early days of the *individual*—his childhood—and secondly in so far as each individual repeats in some abbreviated fashion during childhood the whole course of the development of the human race the reference is *phylogenetic* I believe it not impossible that we may be able to discriminate between that part of the latent mental processes which belongs to the early days of the individual and that which has its roots in the infancy of the race It seems to me for instance that symbolism a mode of expression which has never been individually acquired may claim to be regarded as a racial heritage

This however is not the only archaic feature in dreams You are all familiar from actual experience with the peculiar *amnesia of childhood* to which we are subject I mean that the first years of life up to the age of five six, or eight have not left the same traces in memory as our later experiences True we come across individuals who can boast of continuous recollection from early infancy to the present time but it is incomparably more common for the opposite a blank in memory to be found In my opinion this has not aroused suf

ficient surprise At two years old the child can speak well and soon shows his capacity for adapting himself to complicated mental situations, and, moreover says things which he himself has forgotten when they are repeated to him years later And yet memory is more efficient in early years being less overburdened than it is later Again, there is no reason to regard the function of memory as an especially high or difficult form of mental activity on the contrary excellent memory may be found in people who are yet on a very low plane intellectually

But I must draw your attention to a second peculiarity based upon the first—namely that from the oblivion in which the first years of childhood are shrouded certain clearly retained recollections emerge mostly in the form of plastic images for the retention of which there seems no adequate ground. Memory deals with the mass of impressions received in later life by a process of selection, retaining what is important and omitting what is not but with the recollections retained from childhood this is not so They do not necessarily reflect important experiences in childhood, not even such as must have seemed important from the child's standpoint, but are often banal and meaningless in themselves that we can only ask ourselves in amazement why just this particular detail has escaped oblivion. I have tried, with the help of analysis, to attack the problem of childhood amnesia and of the fragments of recollection which break through it and have come to the conclusion that, whatever may appear to the contrary the child no less than the adult only retains in memory what is important but that what is important is represented (by the processes of condensation and, more especially of displacement already familiar to you) in the memory by something apparently trivial. For this reason I have called these childhood recollections *screen memories* thorough analysis can evolve from them all that has been forgotten.

It is a regular task in psycho-analytic treatment to fill in the blank in infantile memories and, in so far as the treatment is successful to any extent at all (very frequently therefore) we are enabled to bring to light the content of those early years long buried in oblivion. These impressions have never really been forgotten but were only inaccessible and latent, having become part of the unconscious But sometimes it happens that they emerge spontaneously from the unconscious, and it is in connection with dreams that this happens. It is clear that the dream life knows the way back to these latent, infantile experiences. Many good illustrations of this are to be found in psycho-analytical literature, and I myself have been able to furnish a contribution of this sort. I once dreamt in a particular connection of someone who had evidently done me a service and whom I saw plainly He was a one-eyed man short, fat and high shouldered from the context I gathered that he was a doctor Fortunately I was able to ask my mother who was still living what was the personal appearance of the doctor who *attended us at the place* where I was born and which I left at the age of three she told me that he had only one eye and was short, fat and high shouldered I learnt also of the accident which was the occasion of this doctor's being called in and which I had forgotten This command of the forgotten material of the earliest years of childhood is thus a further *archaic* feature of dreams

This knowledge has a bearing on another of the problems which up to the present have proved insoluble You will remember the astonishment caused by our discovery that [illegible]

[illegible]

essary Supposing now that we have interpreted a dream of this sort and the circumstances are specially favourable in that the dreamer does not quarrel with the interpretation itself he does nevertheless in variably ask how any such wish could come into his mind, since it seems quite foreign to him and he is conscious of desiring the exact opposite We need have no hesitation in pointing out to him the origin of the wish he repudiates these evil impulses may be traced to the past often indeed to a past which is not so very far away It may be demonstrated that he once knew and was conscious of them, even if this is no longer so A woman who had a dream meaning that she wished to see her only daughter (then seventeen years old) lying dead found, with our help that at one time she actually had cherished this death wish. The child was the offspring of an unhappy marriage, which ended in the speedy separation of husband and wife. Once when the child was as yet unborn the mother in an access of rage after a violent scene with her husband, beat her body with her clenched fists

in order to kill the baby in her womb How many mothers who today love their children tenderly perhaps with excessive tenderness yet conceived them unwillingly and wished that the life within them might not develop further and have indeed turned this wish into various actions fortunately of a harmless kind The later death wish against beloved persons which appears so puzzling thus dates from the early days of the relationship to them

A father whose dream when interpreted shows that he wished for the death of his eldest and favourite child is in the same way obliged to recall that there was a time when this wish was not unknown to him The man whose marriage had proved a disappointment often thought when the child was still an infant that if the little creature who meant nothing to him were to die he would again be free and would make better use of his freedom A large number of similar impulses of hate are to be traced to a similar source they are recollections of something belonging to the past something which was once in consciousness and played its part in mental life From this you will be inclined to draw the conclusion that such dreams and such wishes would not occur in cases where there have been no changes of this sort in the relations between two persons that is to say where the relation has been of the same character from the beginning I am prepared to grant you this conclusion only I must warn you that you have to consider not the literal meaning of the dream but what it signifies on interpretation It may be that the manifest dream of the death of some beloved person was only using this as a terrible mask whilst really meaning something totally different or it is possible that the beloved person is an illusory substitute for someone else

This situation will however raise in you another and much more serious question You will say Even though this death wish did at one time actually exist and this is confirmed by recollection that is still no true explanation for the desire has long since been overcome and surely at the present time can exist in the unconscious merely as a recollection of no affective value and not as a powerful exciting agent For this later assumption we have no evidence Why is the wish recollected at all in dreams? This is a question which you are really justified in asking the attempt to answer it would take us far afield and would oblige us to define our position with regard to one of the most important points in the theory of dreams But I must keep within the limits of our discussion and must forbear to follow up this question so you must be reconciled to leaving it for the present Let us content ourselves with the actual evidence that this wish, long since subdued can be proved to have given rise to the dream and let us continue our enquiry whether other evil wishes also can be traced in the same way to the past.

Let us keep to the death wishes which we shall certainly find mostly derived from the unbounded egoism of the dreamer Wishes of this sort are very often found to be the underlying agents of dreams Whenever anyone gets in our way in life—and how often must this happen when our relations to one another are so complicated!—a dream is immediately prepared to make away with that person even if it be father mother brother or sister husband or wife It appeared to us amazing that such wickedness should be innate in humanity and certainly we were not inclined to admit without further evidence that this result of our interpretation of dreams was correct But when once we had seen that the origin of wishes of this sort must be looked for in the past we had little difficulty in finding the period in the past of the individual in which there is nothing strange in such egoism and such wishes even when directed against the nearest and dearest A child in his earliest years (which later are veiled in oblivion) is just the person who frequently displays such egoism in boldest relief invariably unmistakable tendencies of this kind or more accurately surviving traces of them are plainly visible in him For a child loves himself first and only later learns to love others and to sacrifice something of his own ego to them Even the people whom he seems to love from the outset are loved in the first instance because he needs them and cannot do without them—again therefore from motives of egoism Only later does the impulse of love detach itself from egoism it is a literal fact that the child learns how to love through his own egoism

In this connection it will be instructive to compare a child s attitude towards his brothers and sisters with his attitude towards his parents The little child does not necessarily love his brothers and sisters and often he is quite frank about it It is unquestionable that in them he sees and hates his rivals and it is well known how commonly this attitude persists

without interruption for many years till the child reaches maturity and even later Of course it often gives place to a more tender feeling or perhaps we should say it is overlaid by this but the hostile attitude seems very generally to be the earlier We can most easily observe it in children of two and a half to four years old when a new baby arrives, which generally meets with a very unfriendly reception remarks such as "I don't like it. The stork is to take it away again are very common. Subsequently every opportunity is seized to disparage the new-comer attempts are even made to injure it and actual attacks upon it are by no means unheard-of If the difference in age is less, by the time the child's mental activity is more fully developed the rival is already in existence and he adapts himself to the situation if on the other hand there is a greater difference between their ages the new baby may rouse certain kindly feelings from the first as an object of interest a sort of living doll and when there is as much as eight years or more between them especially if the elder child is a girl, protective motherly impulses may at once come into play But, speaking honestly when we find a wish for the death of brother or sister latent in a dream we need seldom be puzzled, for we find its origin in early childhood without much trouble or in deed, quite often in the later years when they still lived together

There is probably no nursery without violent conflicts between the inhabitants, actuated by rivalry for the love of the parents competition for possessions shared by them all, even for the actual space in the room they occupy Such hostility is directed against older as well as younger brothers and sisters. I think it was Bernard Shaw who said If there is anyone whom a young English lady hates more than her mother it is her elder sister Now there is something in this dictum which jars upon us it is hard enough to bring ourselves to understand hatred and rivalry between brothers and sisters but how can feelings of hate force themselves into the relation between mother and daughter parents and children?

This relationship is no doubt a more favourable one also from the children's point of view and this too is what our expectations require we find it far more offensive for love to be lacking between parents and children than between brothers and sisters We have so to speak, sanctified the former love while allowing the latter to remain profane. Yet everyday observation may show us how frequently the sentiments entertained towards each other by parents and grown up children fall short of the ideal set up by society and how much hostility lies smouldering ready to burst into flame if it were not stifled by considerations of filial or parental duty and by other tender impulses. The motives for this hostility are well known, and we recognize a tendency for those of the same sex to become alienated daughter from mother and father from son. The daughter sees in her mother the authority which imposes limits to her will, whose task it is to bring her to that renunciation of sexual freedom which society demands in certain cases too the mother is still a rival, who objects to being set aside. The same thing is repeated still more blatantly between father and son. To the son the father is the embodiment of the social compulsion to which he unwillingly submits the person who stands in the way of his following his own will, of his early sexual pleasures and when there is family property of his enjoyment of it. When a throne is involved, this impatience for the death of the father may approach tragic intensity The relation between father and daughter or mother and son would seem less liable to disaster the latter relation furnishes the purest examples of unchanging tenderness undisturbed by any egoistic consideration.

Why, you ask, do I speak of things so banal and so well known to everybody? Because there exists an unmistakable tendency in people's mind to deny the significance of these things in real life and to pretend that the social ideal is much more frequently realized than it actually is. But it is better that psychology should tell the truth than that it should be left to cynics to do so This general denial is only applied to real life, it is true for fiction and drama are free to make use of the motives laid bare when these ideals are rudely disturbed.

There is nothing to wonder at therefore in the dreams of a great number of people bring to light the wish for the removal of their parents especially of the parent whose sex is the same as the dreamer's We may assume that the wish exists in waking life as well, sometimes even in consciousness if it can disguise itself behind another motive as the dream in our third example disguised his real thought by pity for his father's useless suffering It is but rarely that hostility reigns alone—far more

often it yields to more tender feelings which finally suppress it when it has to wait in abeyance till a dream shows it as it were in isolation That which the dream shows in a form magnified by this very isolation resumes its true proportions when our interpretation has assigned to it its proper place in relation to the rest of the dreamer s life. (H Sachs) But we also find this death wish where there is no basis for it in real life and where the adult would never have to confess to entertaining it in his waking life The reason for this is that the deepest and most common motive for estrangement especially between parent and child of the same sex came into play in the earliest years of childhood I refer to that rivalry of affections in which sexual elements are plainly emphasized The son when quite a little child already begins to develop a peculiar tenderness towards his mother whom he looks upon as his own property regarding his father in the light of a rival who disputes this sole possession of his similarly the little daughter sees in her mother someone who disturbs her tender relation to her father and occupies a place which she feels she herself could very well fill Observation shows us how far back these sentiments date sentiments which we describe by the term *Oedipus complex* because in the Oedipus myth the two extreme forms of the wishes arising from the situation of the son—the wish to kill the father and to marry the mother—are realized in an only slightly modified form I do not assert that the Oedipus complex exhausts all the possible relations which may exist between parents and children these relations may well be a great deal more complicated Again this complex may be more or less strongly developed or it may even become inverted but it is a regular and very important factor in the mental life of the child we are more in danger of underestimating than of overestimating its influence and that of the developments which may follow from it Moreover the parents themselves frequently stimulate the children to react with an Oedipus complex for parents are often guided in their preferences by the difference in sex of their children so that the father favours the daughter and the mother the son or else where conjugal love has grown cold the child may be taken as a substitute for the love object which has ceased to attract

It cannot be said that the world has shown great gratitude to psycho analytic research for the discovery of the Oedipus complex on the contrary the idea has excited the most violent opposition in grown up people and those who omitted to join in denying the existence of sentiments so universally reprehended and tabooed have later made up for this by proffering interpretations so wide of the mark as to rob the complex of its value My own unchanged conviction is that there is nothing in it to deny or to gloss over We ought to reconcile ourselves to facts in which the Greek myth itself saw the hand of inexorable destiny Again, it is interesting to find that the Oedipus complex, repudiated in actual life and relegated to fiction has there come to its own O Rank in a careful study of this theme has shown how this very complex has supplied dramatic poetry with an abundance of motives in countless variations modifications and disguises in short, subject to just the distortion familiar to us in the work of the dream censorship So we may look for the Oedipus complex even in those dreamers who have been fortunate enough to escape conflicts with their parents in later life and closely connected with this we shall find what is termed the *castration complex* the reaction to that intimidation in the field of sex or to that restraint of early infantile sexual activity which is ascribed to the father

What we have already ascertained has guided us to the study of the child s mental life and we may now hope to find in a similar way an explanation of the source of the other kind of prohibited wishes in dreams i e the excessive sexual desires We are impelled therefore to study the development of the sexual life of the child and here from various sources we learn the following facts In the first place it is an untenable fallacy to suppose that the child has no sexual life and to assume that sexuality first makes its appearance at puberty when the genital organs come to maturity On the contrary he has from the very beginning a sexual life rich in content though it differs in many points from that which later is regarded as normal What in adult life are termed *perversions* depart from the normal in the following respect [illegible]

gust (3) in the transgression of the incest barrier (the prohibition against seeking sexual gratification with close blood relations) (4) in homosexuality and (5) in the transferring of the part played by the genital organs to other organs and different areas of the body All

these barriers are not in existence from the outset but are only gradually built up in the course of development and education. The little child is free from them. He does not perceive any immense gulf between man and beast; the arrogance with which man separates himself from the other animals only dawns in him at a later period. He shows at the beginning of life no disgust for excrement, but only learns this feeling slowly under the influence of education; he attaches no particular importance to the difference between the sexes, in fact he thinks that both have the same formation of the genital organs; he directs his earliest sexual desires and his curiosity to those nearest to him or to those who for other reasons are specially beloved—his parents, brothers and sisters or nurses; and finally we see in him a character which manifests itself again later at the height of love relationship—namely, he does not look for gratification in the sexual organs only but discovers that many other parts of the body possess the same sort of sensibility and can yield analogous pleasurable sensation, playing thereby the part of genital organs. The child may be said then to be *polymorphously perverse*, and even if mere traces of all these impulses are found in him, this is due on the one hand to their lesser intensity as compared with that which they assume in later life and, on the other hand, to the fact that education immediately and energetically suppresses all sexual manifestations in the child. This suppression may be said to be embodied in a theory, for grown up people endeavour to overlook some of these manifestations and, by misinterpretation, to rob others of their sexual nature until in the end the whole thing can be altogether denied. It is often the same people who first inveigh against the sexual naughtiness of children in the nursery and then sit down to their writing tables to defend the sexual purity of the same children. When they are left to themselves or when they are seduced, children often display perverse sexual activity to a really remarkable extent. Of course grown-up people are right in not taking this too seriously and in regarding it as they say as childish tricks and play, for the child cannot be judged either by moral or legal code as if he were mature and fully responsible. Nevertheless these things do exist and they have their significance both as evidence of innate constitutional tendencies and as much as they cause and foster later developments; they give us an insight into the child's sexual life and so into that of humanity as a whole. If then we find all these perverse wishes behind the distortions of our dreams, it only means that dreams in *this respect also* have regressed completely to the infantile condition.

Amongst these forbidden wishes special prominence must still be given to the incestuous desires, i.e. those directed towards sexual intercourse with parents or brothers and sisters. You know in what abhorrence human society holds, or at least professes to hold, such intercourse, and what emphasis is laid upon the prohibitions of it. The most preposterous attempts have been made to account for this horror of incest: some people have assumed that it is a provision of nature for the preservation of the species manifesting itself in the mind by these prohibitions, because inbreeding would result in racial degeneration; others have asserted that propinquity from early childhood has deflected sexual desire from the persons concerned. In both these cases, however, the avoidance of incest would have been automatically secured and we should be at a loss to understand the necessity for stern prohibitions, which would seem rather to point to a strong desire. Psycho-analytic investigations have shown beyond the possibility of doubt that *an incestuous love-choice is in fact* the first and the regular one, and that it is only later that any opposition is manifested towards it, the causes of which are not to be sought in the psychology of the individual.

Let us sum up the results which our excursions into child-psychology have brought to the understanding of dreams. We have learnt not only that the material of the forgotten childish experiences is accessible to the dream, but also that the child's mental life with all its peculiarities, its egoism, its incestuous object-choice persists in it and therefore in the unconscious and that our dreams take us back every night to this infantile stage. This corroborates the belief that *the Unconscious is the infantile mental life*, and with this the objectionable impression that so much evil lurks in human nature grows somewhat less. For this terrible evil is simply what is original, primitive and infantile in mental life, what we find in operation in the child but in part overlook in him because it is on so small a scale and in part do not take greatly to heart because we do not demand a high ethical standard in a child. By regressing to this infantile stage our dreams

appear to have brought the evil in us to light but the appearance is deceptive though we have let ourselves be dismayed by it we are not so evil as the interpretation of our dreams would lead us to suppose

If the evil impulses of our dreams are merely infantile a reversion to the beginnings of our ethical development the dream simply making us children again in thought and feeling it is surely not reasonable to be ashamed of these evil dreams But the reasoning faculty is only part of our mental life there is much in it besides which is not reasonable and so it happens that although it is unreasonable we nevertheless are ashamed of such dreams We subject them to the dream-censorship and are ashamed and indignant when one of these wishes by way of exception penetrates our consciousness in a form so undisguised that we cannot fail to recognize it yes we even at times feel just as much ashamed of a distorted dream as if we really understood it Just think of the outraged comment of the respectable elderly lady upon her dream about *love service* although it was not interpreted to her So the problem is not yet solved and it is still possible that if we pursue this question of the evil in dreams we may arrive at another conclusion and another estimate of human nature

Our whole enquiry has led to two results which however merely indicate the beginning of new problems and new doubts In the first place the regression in dreams is one not only of form but of substance Not only does it translate our thoughts into a primitive form of expression but it also re awakens the peculiarities of our primitive mental life—the old supremacy of the ego the initial impulses of our sexual life even restores to us our old intellectual possession if we may conceive of symbolism in this way And secondly all these old infantile characteristics which were once dominant and solely dominant must today be accounted to the unconscious and must alter and extend our views about it *Unconscious* is no longer a term for what is temporarily latent the unconscious is a special realm with its own desires and modes of expression and peculiar mental mechanisms not elsewhere operative Yet the latent dream thoughts disclosed by our interpretation do not belong to this realm rather they correspond to the kind of thoughts we have in waking life also And yet they are unconscious how is the paradox to be resolved? We begin to realize that here we must discriminate Something which has its origin in our conscious life and shares its characteristics—we call it *the residue* from the previous day—meets together with something from the realm of the unconscious in the formation of a dream, and it is between these two regions that the dream work is accomplished The influence of the unconscious impinging upon this residue probably constitutes the condition for regression This is the deepest insight into the nature of dreams possible to us until we have explored further fields in the mind but soon it will be time to give another name to the unconscious character of the latent dream thoughts in order to distinguish it from that unconscious material which has its origin in the province of the infantile

We can of course also ask What is it that forces our mental activity during sleep to such regression? Why cannot the mental stimuli that disturb sleep be dealt with without it? And if on account of the dream censorship the mental activity has to disguise itself in the old and now incomprehensible form of expression what is the object of re animating the old impulses desires and characteristics now surmounted what in short is the use of *regression in substance* as well as in *form?* The only satisfactory answer would be that this is the one possible way in which dreams can be formed that dynamically considered the relief from the stimulus giving rise to the dream cannot otherwise be accomplished But this is an answer for which at present we have no justification

FOURTEENTH LECTURE

WISH FULFILMENT

SHALL I remind you once more of the steps by which we have arrived at our present position? When in applying our technique we came upon the distortion in dreams we made up our mind to avoid it for the moment and turned to the study of infantile dreams for some definite information abo h
general N
investigatic
dream-distortion directly and I hope that bit by bit we have also mastered that Now however we are bound to admit that our findings in these two directions do not exactly tally and it behooves us to combine and correlate our results

Both enquiries have made it plain that the essential feature in the dream work is the transformation of thoughts into hallucinatory experi

ence. It is puzzlin, enough to see how this process is accompli ed, b t th s is a pro em for general psychology and we have n to deal

understood how to i erpret them, bu from the outset we expected to be able to brin our ideas abo t them into li with our views on inf tile dream. This expectation was for the first tim fulfilled when we recognized that all dreams are really children s dreams that they make use of infantile material and are charac

dreams also.

We have just subjected a series of dreams to in erpretation, but wit out taking the question of wi h fu men in o consideration all. I feel certa n t at w e w were talking about them, t e ques on repea edly f rced tself upon you What has becom of th wi h-fulfilment which is supposed to be the object of the dream work Now t s ques on is importa t, for is t e on which our lay critics e con sta t a As you know ma kin has an instinctive a tipathy to in ellectual novelties on of t ways in wh h th s s ows elf is that any such nove y is immediat ly reduced to ts very smallest compass and if possible embodied in som ca ch word. *Wish fulfilment* has be com the catch-word fo the new theory of dreams Directly they hear that dreams are said to be wish-fulfilments the la ty ks Where does the wi h-fulfilment com in? and their a king th quest on amoun s t a repudia tion f t idea. They can immediat l think f ountless dreams of the r own which were accompanied by feeling so unpleasant as ometim s t reach the point of agonizing dread and so this statement f the psycho-a alytical theory f dreams appears t them highly im probable It is easy to reply that in distorted dreams the wish f ilment is t openly ex pressed but has to be looked for so that t ca ot be own until the dreams ha e been interpreted. W know too tha the wi hes un derlying t ese dist rted dreams re those which are prohib ted and rejected by the censorship, and that i is just thei ex ence w h is the cause of distortion a d t e motive for the in tervention of the censorship But it is difficult to make the lay cri c understa d that we must not a k about the wi h-fulfilment in a dream before it has been interpre ed he always for gets this His reluct nce to accept the theory of wi h fulfilment is really no hing but the e ect of the dream-censorship causi g him to re pl ce the real though by a substi ute, and fol lowi g from his repudiation of these censored dream wi hes.

Of course we oursel es must feel the need to explain why so many dreams are painful in con ent a d in particular we h ll wan to kn w how we come to have *anxiety-d e ms* Here for the first time we are confronted with the problem of the affects in dreams a problem which deserves special study but one which we can ot concern ourselves with just now unf rtunat ly If the dream is wish fulfil men t ould be impossible for ny painful emotions to come i o it on this point the l y critics seem to be righ But th matter is com pl ca ed by three considerations which they have overlooked.

First, t may happen tha the dream work is not wholly successful in creating a wi h fulfil ment, so that part of the painful fee ing in the latent thoughts is carried over into the mani fest dream Analysis would then have to how that these thou hts were a great deal more painful than th dream which is formed from them th s much can be proved in every in stance. We admit then tha the dream work has failed in i s purpose, just as a dream of drink ing excited by the stimulus of thirs fails to quench tha thirst. One is still thirsty after i and has to wake up a d drink. Neverthele s it is a proper dream it has renounced nothing of i s essential n ture We must say "*Ut desint vires t men e t l u d vo a ur as*" The clearly recognizab intention remains a praiseworthy one, at any ra e. S ch instances of f ilure in the work re by no mea s rare and one reason is that is so much more difficult for the dream-work t produce the required change in t nature of the affect than to modify the con tent fects are often very i tractable. So t happens ha in the process of the dream work the painful *con ert* of th dream-thoughts is tran ormed in a wi h fu lmen whi e the painful *a ect* persists unchanged. When th s occurs the affect is qu t out of harmony with the content, w ich gives our critics th oppor

The will is commenda le, though the a ty may be wanting.

tunity of remarking that the dream is so far from being a wish fulfilment that even a harmless content may be accompanied in it by painful feelings Our answer to this rather unintelligent comment will be that it is just in dreams of this sort that the wish fulfilling tendency of the dream work is most apparent because it is there seen in isolation The mistake in this criticism arises because people who are not familiar with the neuroses imagine a more intimate connection between content and affect than actually exists and so cannot understand that there may be an alteration in the content while the accompanying affect remains unchanged

A second consideration much more important and far reaching but equally overlooked by the laity is the following A wish fulfilment must certainly bring some pleasure but we go on to ask To whom? Of course to the person who has the wish But we know that the attitude of the dreamer towards his wishes is a peculiar one he rejects them censors them in short he will have none of them Their fulfilment then can afford him no pleasure rather the opposite and here experience shows that this *opposite* which has still to be explained takes the form of *anxiety* The dreamer where his wishes are concerned is like two separate people closely linked together by some important thing in common Instead of enlarging upon this I will remind you of a well known fairy tale in which you will see these relationships repeated A good fairy promised a poor man and his wife to fulfil their first three wishes They were delighted and made up their minds to choose the wishes carefully But the woman was tempted by the smell of some sausages being cooked in the next cotta e and wished for two like them Lo! and behold there they were—and the first wish was fulfilled With that the man lost his temper and in his resentment wished that the sausages might hang on the tip of his wife s nose This also came to pass and the sausages could not be removed from their position so the second wish was fulfilled but it was the man s wish and its fulfilment was most unpleasant for the woman You know the rest of the story as they were after all man and wife the third wish had to be that the sausages should come off the end of the woman s nose We might make use of this fairy tale many times over in other contexts but here it need only serve to illustrate the fact that it is possible for the fulfilment of one person s wish to be very disagreeable to someone else unless the two people are entirely at one

It will not be difficult now to arrive at a still better understanding of anxiety-dreams There is just one more observation to be made use of and then we may adopt an hypothesis which is supported by several considerations The observation is that anxiety dreams often have a content in which there is no distortion it has so to speak escaped the censorship This type of dream is frequently an undisguised wish fulfilment the wish being of course not one which the dreamer would accept but one which he has rejected anxiety has developed in place of the working of the censorship Whereas the infantile dream is an open fulfilment of a wish admitted by the dreamer and the ordinary distorted dream is the disguised fulfilment of a repressed wish the formula for the anxiety dream is that it is the open fulfilment of a repressed wish Anxiety is an indication that the repressed wish has proved too strong for the censorship and has accomplished or was about to accomplish its fulfilment in spite of it We can understand that fulfilment of a repressed wish can only be for us who are on the side of the censorship an occasion for painful emotions and for setting up a defence. The anxiety then manifested in our dreams is if you like to put it so anxiety experienced because of the stren th of wishes which at other times we manage to stifle The study of dreams alone does not reveal to us why this defence takes the form of anxiety obviously we must consider the latter in other connections

The hypothesis which holds good for anxiety dreams without any distortion may be adopted also for those which have undergone some degree of distortion and for other kinds of unpleasant dreams in which the accompanying unpleasant feelings probably approximate to anxiety Anxiety dreams generally wake us we usually break off our sleep before the repressed wish behind the dream overcomes the censorship and reaches complete fulfilment. In such a case the dream has failed to achieve its purpose but its essential character is not thereby altered We have compared the dream with a night watchman a guardian of sleep whose purpose it is to protect sleep from interruption Now night watchmen also just like dreams have to rouse sleepers when they are not strong enough to ward off the cause of disturbance or danger alone Nevertheless we do sometimes succeed in continuing to sleep even when our dreams begin to give us some uneasiness and

to turn to anxiety We say to ourselves in leep It is only a dream fter all and go on sleeping.

Yo may a k *when* it happens that the dream wish is able to o rcome the c sorship This may depend ther n the wish or on the cen orship it may be that f r unknown rea ons th trength of the wi h at times becomes excessi e but our impres n is that it s more ften th ttitude of the cen orship which is responsible fo this hifting in the balance of power We ha e already heard that the cen r ship works with arying intens ty in each in di idual instance t eating the diffe ent ele ments with diffe ent degrees of strictnes now w may add that t s ery ariable in its gen eral beha ou and does not show tself lways equally severe towards the sam elem nt If then t chan es that th cens rship feels itself f r once pow less gainst som dream wish which thre tens t overflow it t then instead of making use of distort on emplo s the last weapo left to t and destroys sleep by bringing bout an ac es of anxi ty

At this point t strikes us that we till hav idea why these evil, rej cted wishes rise up just t night time s as to disturb us when w sleep Th answe can hardly be found ex cept in an the h pothesis which goes back to the nature f sleep t elf During the day the h y pressur of a censorship is ex ct ed upon thes wishes and rul t imposs ble for th m to make th msel es f lt t all. But in the n ght t is probabl that this cens rship lik ll th other terests f mental lif i sus pended o t lea t ery much weake ed, in fa our of the ingl des e for leep So it is due t this partial abrogat on of the censorship at night that the fo b dden wishes can gain be om cti Th nervous people s ffering from insomnia who c f ss that th ir leepless ess was volunt ry in the first insta ce for they did not dare to go t leep beca se they were fraid f th dreams—that is t say the feared th consequence f th d min hed igilan f the en rship Yo will ha e o difficulty in und rst din that this curta lment f th ensorship does t argu y flagrant carelessness leep impa rs our mot fun tions even f our ev l tentions do begin t ti with us the tmost they can do is t pro d ce dream whi h is f all pract cal pur poses harmless and it is this comfortin cir cumsta ce whi h gi es rise to the leepe s rem k, mad t true in the night b t yet not part f his d eam l f It is only dream. So we let it ha e its way and continue to sleep

Thirdly f you call to mind our idea that the dreamer stri ing agai st his own wi hes is like combination of two persons eparate and yet som how intimat ly united, you will be able to und rstand another poss ble way in which something that is highly unpleasant may be brought about through wish fulfilment I am speakin of punishment. Here a a n the fairy tale of the three wishes may help to make things clear The usages on the plate were the d ect fulfilment of the first person s (the woman s) wish the sausages on the t p of her nos w e the fulfilment of the econd person s (the husband s) wi h but at the same time they w re the puni hment for the fool h wi h f th wif In th euroses we hall meet with rd re the

mental life of man they are t i and w may well regard them as respon ble for some of ou painful dreams. N w you will pr bably think that with all this there is ery little f the famous wish fulfilment left but on closer co sideratio you will admit that you are wr n In comparison with the manifold pos ibilit es (t be discussed lat r) of wh t dreams m ght be—ac ording t som writers, what they actually re—the solutio wi h fulfilm t anxiety fulfilm t puni hme t ful filment s surely quite n rrow o e Add to this that anxiety is the direct opposite of a wish and that opposites lie ery nea o e an w h e learned

On the whole then, I ha e made n conces s on to you obj ctio to the wish fulfilment theory w are bound however to demon trate its pre en in a y and every di torted dream and we ha e certainly no desir to sh k this task. Let us g b ck to th dream we ha lready interpreted, bout the three bad thea tickets f on florin d a half from wh h we ha already learnt a good deal. I hope you still remembe it A lady who e husband t ld h r day bout the engagement of he friend Eli wh w s only three month youn e than h rs lf dreamt on th following n ght th t he and h husba d wer at th theat and that o e s de of th stall was alm t empty H husband told he that Elis and her fiancé h d wanted t g t th theatr too b t l not, because they could only get uch bad seats

three tickets for a florin and a half His wife said that they had not lost much by it We discovered that the dream thoughts had to do with her vexation at having been in such a hurry to marry and her dissatisfaction with her husband We may well be curious how these gloomy thoughts can have been transformed into a wish fulfilment and what trace of it can be found in the manifest content Now we know already that the element *too soon too great a hurry* was eliminated by the censorship the empty stalls are an allusion to this element The puzzling phrase *three for one florin and a half* is now more comprehensible to us than at first through the knowledge of symbolism that we have acquired since then The number *three* really stands for a man and we can easily translate the manifest element to mean *to buy a man* (husband) *with the dowry* (I could have bought one ten times better for my dowry) *Going to the theatre* obviously stands for marriage *Getting the tickets too soon* is in fact a direct substitute for *marrying too soon* Now this substitution is the work of the wish fulfilment The dreamer had not always felt so dissatisfied with her premature marriage as she was on the day when she heard of her friend s engagement She had been proud of her marriage at the time and considered herself more highly favoured than her friend One hears that naive girls on becoming engaged frequently express their delight at the idea that they will now soon be able to go to all plays and see everything hitherto forbidden them

The indication of curiosity and a desire to look on evinced here comes without doubt originally from the sexual *ga ing impulse* especially regarding the parents and this became a strong motive impelling the girl to marry early in this manner going to the theatre became an obvious allusive substitute for getting married In her vexation at the present time on account of her premature marriage she therefore reverted to the time when this same marriage fulfilled a wish by gratifying her *skoptophilia* and so guided by this old wish impulse she replaced the idea of marriage by that of going to the theatre

We may say that the example we have chosen to demonstrate a hidden wish fulfilment is not the most convenient one but in all other distorted dreams we should have to proceed in a manner analogous to that employed above It is not possible for me to do this here and now so I will merely express my conviction that such procedure will invariably meet with success. But I wi h to dwell longer upon this point in our theory experience has taught me that it is one of the most perilous of the whole theory of dreams exposed to many contradictions and misunderstandings Besides you are perhaps still under the impression that I have already retracted part of my statement by saying that the dream may be either a wish fulfilment or its opposite an anxiety or a punishment brought to actuality and you may think this a good opportunity to force me to make further reservations Also I have been reproached with presenting facts that seem obvious to myself in a manner too condensed to carry conviction

When anyone has gone as far as this in dream interpretation and has accepted all our conclusions up to this point it often happens that he comes to a standstill at this question of wish fulfilment and asks Admitting that every dream means omething and that this meaning may be discovered by employing the technique of psycho analysis why must it always in face of all the evidence to the contrary be forced into the formula of wish fulfilment? Why must our thoughts at night be any less many sided than our thoughts by day so that at one time a dream might be a fulfilment of some wish at another time as you say yourself the opposite the actualization of a dread or again the expression of a resolution a warning a weighing of some problem with its pros and cons or a reproof some prick of conscience or an attempt to prepare one elf for something which has to be done—and so forth? Why this perpetual insistence upon a wish or at the most its opposite?

It might be supposed that a difference of opinion on this point is a matter of no great moment if there is agreement on all others Cannot we be satisfied with having d scovered the meaning of dreams and the ways by which we can find out the meaning? We surely go back on the advance we have made if we try to limit this meaning too strictly But this is not so A misunderstanding on this head touches what is es ential to our knowled e of dreams and imperil its value for the understandin of neuro es Moreover that readiness to *oblige the otle party* which has its value in business life is not only out of place but actually harmful in scientific matters

My first answer to the question why dreams

A th i terp etat f th mbe *th* o r g the d e m f th h ldles w m l ry cl e b t I w ll n t m t it b be th analys s d d not f m h a y mat al ll st t it.

should not be manv s d d in their meani..g is the usual o e in such a case I d n t know why they should n t be so and sh uld have no object o if they were As f r as I am con c rned they can be so! But there is just one tri..ng obstacle in the way of this wid r and more co venient co ception of dreams—that as a matter of fact they are not so My second answer w uld emphasize the point that to as sum that dreams represe t man fold modes f tho g t and intellectual operations is by no means a novel dea to mys lf once in the history of pathol gical case I recorded a dream which occurred three n ghts running and never agun and ga e it as my xplanation that this dream corresponded to a res lut on the repeti tio of which became unnecessary as soon as that resolutio was carried out Later on I published a dre..m which epresented a confes si How is t pos ble f r me then t c n tradict myself and assert that dreams are al ways and only wish f lfilme ts

I d t rather than permit a tup d misund r standing whi h m ght cost us the fruit of all our labours on the subject of dreams a misund rstanding that *conf unds the d e m with the l..ent d e m thought* nd makes state ments with regard t th f rmer whi h are p plica l to the *latter nd to the latter only* For t is perf ctly true that dreams can represent and be themselves replaced by all th modes of th ght just enum rated resolutions warn ings, reflect ons preparati ns o attempts to solve some problem r gard t cond ct, and so on But when you *look closely* you will rec ognize that all this i true only of th la..ent thou hts whi h have been transform d into the dream. Y u l arn from interpretations f dreams that the unco scious though processes f ma kind re cup ed with such resolutions, preparations and reflectio s out f which dreams re formed by means f the dream work If your int rest t any given moment is *t o m ch in the dream w rk*, but centres on the unconscious thought processes in peopl you will then eliminate the dream f rmation and say f dream themselves what is for all practical purposes correct, that th y represent warning a resol e, and This is what is f en d ne in psycho analytic w rk gen rally w endeavour simply to demolish the manifest form f dreams and to substit f r t the co responding latent thoughts in whi h th dream originated.

Thus it is that we learn quite incidentally f om our attempt t assess the latent dream thoughts that all the h ghly complicated mental acts we ha e enumerated can be perform d un consciously—a *conclusion* surely as tremen dous as t is bewildering

B t to go back a little you are quite right in speaking of *dreams* as *representing* these various modes of thought, provided that you are quite clear *in you own* minds that you are u ing an abbreviated form of expres on and do not imagine that the manifold variety of which you speak is in its lf part of the essential nature f *dreams* When you speak of *a dream* you must mean ther the *man fest* dream i e. the prod ct of the dream work, or at most that work tself i.e., the mental process wh ch forms the latent dream thoughts into the manifest dream. To use the word in any other sense is *a confus on of ideas* which is bound to be mi ch evous If what you say s meant to apply to th latent thoughts behind the dream then say so plainly and do not add to the obscurity of the problem by your loose way of expressing yoursel es The late t dream thou hts are the material which is tran formed by th dream work into the manifest dream What makes you con tantly confound the material with the process wh ch deals with t? If you do that in what way are you *superior* to those who know of the final prod ct only witho t being ble to explain where it comes from or how t is con structed?

The only thing esse t al to the dream itself is the dream wo k which has operated upon the thought material a d when we come to theory we ha e no ri ht to disrega d this even f in certain practical situations t m y be neglected Furth analytic observation hows that the dream work never con..ists merely in tran..lat

day tim b t which is th actual m t force in dream form ti this indispensable c m po t being the equally unconsci us *wi h to* fulfil wh ch the cont nt of th d eam is trans f rmed In so f then a you are considering o ly the thought represe t d in t the dream may be any conc able thin —a warnin a resol e a preparation and so on but be. des this t tself is always th fulfilment of an un co cious wi h a d, when you regard t as the result of the d eam wo k, t s this al A dream then i ever simply th expres on of a resol e r warning and n thing more in it the resolve or whatever it may be is trans-

lated into the archaic form with the assistance of an unconscious wish and metamorpho ed in such a way as to be a fulfilment of that wish This single characteristic that of fulfilling a wish is the constant one the other component varies it may indeed itself be a wish in which event the dream represents the fulfilment of a latent wish from our waking hours brou ht about by the aid of an unconscious wish

Now all this is quite clear to myself but I do not know whether I have succeeded in making it equally clear to you and it is difficult to prove it to you for on the one hand proof requires the evidence afforded by a careful analysis of many dreams and on the other hand this the crucial and most important point in our conception of dreams cannot be presented convincingly without reference to considerations upon which we have not yet touched Seeing how closely linked up all phenomena are you can hardly imagine that we can penetrate very far into the nature of any one of them without troubling ourselves about others of a similar nature Since as yet we know nothing about those phenomena which are so nearly akin to dreams—neurotic symptoms—we must once more content ourselves with what we actually have achieved I will merely give you the explanation of one more example and adduce a new consideration

Let us take once more that dream to which we have already reverted several times the one about the three theatre tickets for one florin and a half I can assure you that I had no ulterior motive in selecting it in the first instance for an illustration You know what the latent thoughts were the vexation after hearing that her friend had only just become engaged that she herself should have married so hastily depreciation of her husband and the idea that she could have found a better one if only she had waited We also know already that the wish which made a dream out of these thoughts was the desire to *look on* to be able to go to the theatre—very probably an offshoot of an old curiosity to find out at last what really does happen after marriage It is well known that in children this curiosity is regularly directed towards the sexual life of the parents that is to say it is an infantile impulse and wherever it persists later in life it has its roots in the infantile period But the news received on the day previous to the dream gave no occasion for the awakening of this skoptophilia it only roused vexation and regret This wish impulse (of skoptophilia) was not at first connected with the latent thoughts, and the results of the dream interpretation could have been used by the analysis without taking it into consideration at all. But again the vexation was not in itself capable of producing a dream no dream could be formed out of the thought It was folly to be in such a hurry to marry until that thou ht had stirred up the early wish to see at last what happened after marriage Then this wish formed the dream content substituting for marria e the going to the theatre and the form was that of the fulfilment of the earlier wish Now I may go to the theatre and look at all that we have never been allowed to see and you may not I am married and you have got to wait. In this way the actual situation was transformed into its opposite and an old triumph substituted for the recent discomfiture and incidentally satisfaction both of a *ga ing* impulse and of one of egoistic rivalry was brou ht about It is this latter satisfaction which determines the manifest content of the dream for in it she is actually sitting in the theatre while her friend cannot get in Those portions of the dream content behind which the latent thoughts still conceal themselves are to be found in the form of inappropriate and incomprehensible modifications of the gratifying situation The business of *interpretation* is to put aside tho e features in the whole which merely represent a wish fulfilment and to reconstruct the painful latent dream thou hts from these indications

The consideration which I said I wished to call to your notice is intended to direct your attention to these latent dream thoughts now brou ht into prominence I must beg you not to forget that first the dreamer is unconscious of them secondly that they are quite reasonable and coherent so that we can understand them as comprehensible reactions to whatever stimulus has given rise to the dream and thirdly that they may have the value of any mental impulse or intellectual operation I will designate these thou hts more strictly now than hitherto as *the residue from the previous day* the dreamer may acknowledge them or not. I then distinguish between this *residue* and *latent d eam thoughts* so that as w h [illegible] been ac [illegible] hing [illegible] the [illegible] *the* [illegible] *e pre ous day* is only a part of the latent dream thoughts Then our conception of what happens is this something has

been added to the residu from the previous da something which also belongs to the un consci us, strong b t repressed wish impulse and it is this alone which makes the formation f a dream possible. The wish-impulse acting upon the r sid e crea e the other part of the la ent dream-thou ts that part which no longer need appear rational or comprehensible from the point of view of our waking life

T illustrate the relation between the resi due and the unconscious wi h I ha e elsewhere made use of a comparison which I cannot d be ter than repeat here Every business under taking requires a capitalist to defray the ex penses and an en repreneur who has th idea and understands how to carry it out. Now the part f the capitalist in dream formation i al ways and only pla ed by the unconscious wish r supp es the necessary fund of mental energy f t the entrepreneur is th residue from the pre ous day determining the manner f the expenditure. It is, f c urse, quite possib e f *the capitalist himself to ha e the dea and* the special know edge eeded, or for th entre-preneur himself to ha e cap tal. This simplifies the practical situation but makes the theory of it m re difficult. In economics we discriminate between the man in his function of capitalist and the same man in his capacity as entrepre neur and thi distinction restores the funda mental situati upo which our mparison is based. The same ariations are to be f und in the formation f dreams I leave you to follow them out for ourselves

W cannot go an further t this point for I think t likel that a dist b g though has long since occurred t u and t deserves a hearing You may a k Is the so-called *sidue* really unconscious in the sense in which the wish ecessary fo the formation of the dream is unconscious Your suspicion is justified this is the salient point in the whol matter They are not both unc nscious in the same sense. The dream wish belongs to a different type of unco scious which as we ha e seen, has its roots in the infantile period and is fur nished with special mechanisms It is very expedient t di tinguish the two types f *un onscious* from one another by speaking of them in different terms B t, all the sam we will rather wait until we ha e f miliarized our selves with the phen mena f the neuroses If o conception f th xistence of any kind of unconscious be lread regarded as fantast c, what will people say f w dmit that t reach our solution we ha e had t assume tw kinds?

Let us break on at this point. Once more you ha e heard only an incomplete tatement but is it not a hopeful thou ht that this knowledge will be carried further either by ourselves or by those w o come after us? And have not we *ourselves* learnt enough that is new and tartling?

FIFTEENTH LECTURE

DOUBTFUL POINTS A D CRITICAL OBSERVATIO S

WE will not lea e the ubject of dreams with out dealing with the most *common* doubts and uncertainties arising in connection with the novel ideas and conceptions we have been discussin those of you who have followed these lectures attentively will have collected some ma erial of the kind.

1 You may ha e recei ed an impression that even with strict dh rence *to technique our* work f dream interpretation leaves so much room for uncertainty that reliable translation f manifest dreams into their latent dream *thou h s will be thereby frustrated. You will* urge first that ne never knows whether any particular el ment in a dream s to be under stood *literally o symbolically* ince things employed as symbols do not thereby cease to be themselves Where there is no objective ev dence t decid the question the int rpreta t on on that particular point will be left to be arb trarily determined by the interprete Fur th since in the dream wo k opposites coincid it is in every instance uncertain whethe a specific dream-element i to be unders ood in positive or a negative sense as itself or as its opposite—anoth r opportuni ty for the in rpreter to exercise a cho ce Thirdly on count of the frequency with whi h in ers on f every kind is employed in dreams it is open to him to assum whenever he chooses that such an inversion has taken place Finally ou will point to having heard that one is seldom certain that th interpre tation arrived at is the only pos ib e one and that there is danger f *overlookin* another perfectly admissibl int rpretation of the same dream. In these circumstances you will con lud the discretion of th interprete has a la t de that eems incompatible with any ob-jective certainty in the result. Or you may also assume that the fault does not lie in dreams themselves but that something erroneous in ur conceptions and premises produces the un satisfactory character f our interpretations.

All that you say is undeniable and yet I do not think it justifies either of your conclusions that dream interpretation as practised by us is at the mercy of the interpreter s arbitrary decisions or that the inadequacy of the results calls in question the correctness of our procedure If for the *arbitrary decision* of the interpreter you will substitute his skill his experience and his understanding then I am with you This kind of personal factor is of course indispensable especially when interpretation is difficult it is just the same in other scientific work however it can t be helped that one man will u e any given technique less well or apply it better than another The impression of arbitrariness made for example by the interpretation of symbols is corrected by the reflection that as a rule the connection of the dream thoughts with one another and of the dream with the life of the dreamer and the whole mental situation at the time of the dream points directly to one of all the possible interpretations and renders all the rest useless The conclusion that the imperfect character of the interpretations proceeds from fallacious hypotheses loses its force when consideration shows that on the contrary the ambiguity or indefiniteness of dreams is a quality which we should necessarily expect in them

Let us call to mind our statement that the dream work undertakes a translation of the dream thoughts into a primitive mode of expression analogous to hieroglyphics Now all such primitive systems of expression are nec es arily acompanied by ambiguity and indefiniteness but we should not on that account be justified in doubting their practicability You know that the coincidence of opposites in the dream work is analogous to what is called the antithetical sense of primal words in the oldest languages The philologist R Abel to whom we owe this information writing in 1884 begs us not on any account to imagine that there was any ambiguity in what one person said to another by means of ambivalent words of this sort On the contrary intonation gestures and the whole context can have left no doubt what ever which of the two opposites the speaker had in mind to convey In writing where gestures are absent the addition of little pictorial signs not meant to receive separate oral ex pre sion replaced them e g a drawing of a little man either crouching or standing upright according as the ambiguous *ken* of the hieroglyphic meant *weak* or *strong* So that misunderstanding was avoided in spite of th ambiguity of sounds and signs

In ancient systems of expression for instance in the scripts of the oldest languages, indefiniteness of various kinds is found with a frequency which we should not tolerate in our writings today Thus in many Semitic writings only the consonants of the words appear the omitted vowels have to be supplied by the reader from his knowledge and from the context Hieroglyphic writing follows a similar principle although not exactly the same and this is the reason why nothing is known of the pronunciation of ancient Egyptian There are besides other kinds of indefiniteness in the sacred writings of the Egyptians for example it is left to the writer s choice to inscribe the pictures from right to left or from left to right To be able to read them we have to remember that we must be guided by the direction of the faces of the figures birds and so forth But it was al o open to the writer to set the pictures in vertical columns and in the case of inscriptions on smaller objects he was led by considerations of what was plea ing to the eye and of the space at his di posal to introduce still further alterations in the arrangement of the signs The most confusing feature in hieroglyphic script is that there is no spac in between the words The pictures are all placed at equal intervals on the pa e and it is generally impossible to know whether any given sign goes with the preceding one or forms the beginning of a new word In Persian cuneiform writing on the other hand a slanting sign is used to separate the words

The Chinese language both poken and written is exceedingly ancient but is still used today by four hundred million people Don t suppo e that I understand it at all I only obtained some information about it becau e I hoped to find in it analogies to the kind of indefiniteness occurring in dreams nor was I disappointed in my expectation for Chinese is so full of uncertainties as positively to terrify one As is well known it consists of a number of syllabic sounds which are pronounced singly or doubled in combination One of the chief dialects has about four hundred of these sounds and since the vocabulary of this dialect i estimated at somewhere about four thousand words it is evident that every sound has an average of ten different meanings—some fewer but some all the more For this reason there are a whole series of devices to escape ambiguity for the context alone will not show

which of the ten possible meanings of the syllable the speaker wishes to convey to the hearer. Amongst these devices is the combining of two sounds into a single word and the use of four different "tones" in which these syllables may be spoken. For purposes of our comparison a still more interesting fact is that this language is practically without grammar; it is impossible to say of any of the one-syllable words whether it is a noun, a verb or an adjective, and, further there are no inflections to show gender, number, case, tense or mood. The language consists, as we may say, of the raw material only, just as our thought-language is resolved into its raw material by the dream-work omitting to express the relations in it. Wherever there is any uncertainty in Chinese the decision is left to the intelligence of the listener, who is guided by the context. I made a note of a Chinese saying which literally translated runs thus: "Little what see much what wonderful." This is simple enough to understand. It may mean "The less a man has seen, the more he finds to wonder at," or "There is much to wonder at for the man who has seen little." Naturally there is no occasion to choose between these two translations which differ only in grammatical construction. We are assured that, in spite of these uncertainties, the Chinese language is a quite exceptionally good medium of expression; so it is clear that indefiniteness does not necessarily lead to ambiguity.

Now we must certainly admit that the position of affairs is far less favourable in regard to the mode of expression in dreams than it is with these ancient tongues and scripts; for these latter were originally designed as means of communication, that is, they were intended to be understood, no matter what ways or means they had to employ. But just this character is lacking to dreams; their object is not to tell anyone anything, they are not a means of communication; on the contrary, it is important to them not to be understood. So we ought not to be surprised or misled if the result is that a number of the ambiguities and uncertainties in dreams cannot be determined. The only certain piece of knowledge gained from our comparison is that this indefiniteness (which people would like to make use of as an argument against the accuracy of our dream-interpretations) is rather to be recognized as a regular characteristic of all primitive systems of expression.

Practice and experience alone can determine the extent to which dreams can in actual fact be understood. My own opinion is that this is possible to a very great extent, and a comparison of the results obtained by properly trained analysts confirms my view. It is well known that the lay public, even in scientific circles, delights to make a parade of superior scepticism in the face of the difficulties and uncertainties which beset a scientific achievement. I think they are wrong in so doing. You may possibly not all know that the same thing happened at the time when the Babylonian and Assyrian inscriptions were being deciphered. There was a point at which public opinion was active in declaring that the men deciphering the cuneiform writings were victims of a chimera and that the whole business of investigation was a fraud. But in the year 1857 the Royal Asiatic Society made a conclusive test. They challenged four of the most distinguished men engaged in this branch of research—Rawlinson, Hincks, Fox Talbot and Oppert—to send to the Society in sealed envelopes independent translations of a newly discovered inscription, and, after comparing the four versions, they were able to announce that there was sufficient agreement between the four to justify belief in what had been achieved and confidence in further progress. The mockery of the learned laity then gradually came to an end, and certainty in the reading of cuneiform documents has advanced enormously since then.

2. A second series of objections is closely connected with an impression which you also have probably not escaped, namely, that a number of the solutions achieved by our method of dream-interpretation seem strained, specious, *dragged in*—in other words forced, or even comical or joking. These criticisms are so frequent that I will take at random the last that has come to my ears. Now listen: a headmaster in Switzerland—that free country—was recently asked to resign his post on account of his interest in psycho-analysis. He protested and a Berne paper published the decision of the school authorities in his case. I shall quote from the article a few sentences which refer to psycho-analysis: "Further, we are amazed at the far-fetched and fictitious character of many of the examples given in the said book by Dr. Pfister of Zurich. . . . It is indeed a matter for surprise that the head master of a Training College should accept so credulously all these assertions and such specious evidence." These sentences purport to be the final opinion

All that you say is undeniable and yet I do not think it justifies either of your conclusions that dream interpretation as practised by us is at the mercy of the interpreter s arbitrary decisions or that the inadequacy of the results calls in question the correctness of our pro cedure If for the *arbitrary decision* of the interpreter you will substitute his skill his ex perience and his understanding then I am with you This kind of personal factor is of course indispensable especially when interpretation is difficult it is just the same in other scientific work however it can t be helped that one man will use any given technique less well or apply it better than another The impression of arbitrariness made for example by the inter pretation of symbols is corrected by the reflec tion that as a rule the connection of the dream thoughts with one another and of the dream with the life of the dreamer and the whole mental situation at the time of the dream points directly to one of all the pos sible interpretations and renders all the rest useless The conclusion that the imperfect character of the interpretations proceeds from fallacious hypotheses loses its force when con sideration shows that on the contrary the ambiguity or indefiniteness of dreams is a quality which we should necessarily expect in them

Let us call to mind our statement that the dream work undertakes a translation of the dream thoughts into a primitive mode of ex pression analogous to hiero lyphics Now all such primitive systems of expression are nec essarily acompanied by ambiguity and indefi niteness but we should not on that account be justified in doubting their practicability You know that the coincidence of opposites in the dream work is analogous to what is called the antithetical sense of primal words in the oldest languages The philolo ist R Abel to whom we owe this information writing in 1884 begs us not on any account to imagine that there was any ambiguity in what one person said to another by means of ambivalent words of this sort On the contrary intonation gestures and the whole context can have left no doubt what ever which of the two opposites the speaker had in mind to convey In writing where ges tures are absent the addition of little pictorial signs not meant to receive separate oral ex pression replaced them e g a drawing of a little man either crouching or standing upright according as the ambiguous *ken* of the hiero glyphic meant *weak* or *strong* So that mis-understanding was avoided in spite of th ambiguity of sounds and signs

In ancient systems of expres ion for in stance in the scripts of the oldest languages, indefiniteness of various kinds is found with a frequency which we should not tolerate in our writings today Thus in many Semitic writings only the consonants of the words appear the omitted vowels have to be supplied by the reader from his knowledge and from the context Hieroglyphic writin follows a similar principle although not exactly the same and this is the reason why nothing is known of the pronunciation of ancient Egyp tian There are besides other kind of indefi niteness in the acred writings of the Egyptians for example it is left to the writer s choice to inscribe the pictures from right to left or from left to right To be able to read them we have to remember that we must be guided by the direction of the faces of the figures birds and so forth But it was al o open to the writer to set the pictures in vertical columns and in the case of inscriptions on maller objects he was led by considerations of what was pleasing to the eye and of the space at his di posal to in troduce still further alterations in the arrange-ment of the signs The most confusing feature in hieroglyphic script is that there is no spac ing between the words The pictures are all placed at equal intervals on the pa e and it is generally impossible to know whether any given sign goes with the preceding one or forms the beginning of a new word In Persian cuneiform writing on the other hand a slanting sign is used to separate the words

The Chinese language both poken and written is exceedingly ancient but is still used today by four hundred million people Dont suppose that I understand it at all I only ob-tained some information about it becaue I hoped to find in it analogies to the kind of indefiniteness occurring in dreams nor was I disappointed in my expectation for Chinese is so full of uncertainties as positively to terrify one As is well known it con ists of a number of syllabic sounds which are pronounced singly or doubled in combination One of the chief dialects has about four hundred of these sounds and since the vocabulary of this dialect is estimated at somewhere about four thousand words it is evident that every sound has an average of ten different meanings—some fewer but some all the more For this reason there are a whole series of devices to escape am biguity for the context alone will not show

which of the ten possible meanings of the syllable the speaker wishes to convey to the hearer. Amongst these devices is the combining of two sounds into a single word and the use of four different tones in which these syllables may be spoken. For purposes of our comparison a still more interesting fact is that this language is practically without grammar: it is impossible to say of any of the one-syllable words whether it is a noun, a verb or an adjective, and further there are no inflections to show gender, number, case, tense or mood. The language consists, as we may say, of the raw material only, just as our thought-language is resolved into its raw material by the dream-work omitting to express the relations in it. Wherever there is any uncertainty in Chinese the decision is left to the intelligence of the listener, who is guided by the context. I made a note of a Chinese saying which literally translated runs thus: "Little what see much what wonderful." This is simple enough to understand. It may mean: "The less a man has seen, the more he finds to wonder at," or: "There is much to wonder at for the man who has seen little." Naturally there is no occasion to choose between these two translations which differ only in grammatical construction. We are assured that in spite of these uncertainties the Chinese language is quite exceptionally good medium of expression, so it is clear that indefiniteness does not necessarily lead to ambiguity.

Now we must certainly admit that the position of affairs is far less favourable in regard to the mode of expression in dreams than it is with these ancient tongues and scripts; for these latter were originally designed as a means of communication, that is they were intended to be understood, no matter what ways or means they had to employ. But just this character is lacking to dreams; their object is not to tell anyone anything, they are not means of communication: on the contrary it is important to them not to be understood. So we ought not to be surprised or misled if the result is that a number of the ambiguities and uncertainties in dreams cannot be determined. The only certain piece of knowledge gained from our comparison is that this indefiniteness (which people would like to make use of as an argument against the accuracy of our dream-interpretations) is rather to be recognized as a regular characteristic of all primitive systems of expression.

Practice and experience alone can determine the extent to which dreams can in actual fact be understood. My own opinion is that this is possible to a very great extent, and a comparison of the results obtained by properly trained analysts confirms my view. It is well known that the lay public, even in scientific circles, delights to make a parade of superior scepticism in the face of the difficulties and uncertainties which beset a scientific achievement. I think they are wrong to do so. You may possibly not all know that the same thing happened at the time when the Babylonian and Assyrian inscriptions were being deciphered. There was a point at which public opinion was active in declaring that the men deciphering the cuneiform writing were victims of a chimera and that the whole business of investigation was a fraud. But in the year 1857 the Royal Asiatic Society made a conclusive test. They challenged four of the most distinguished men engaged in this branch of research—Rawlinson, Hincks, Fox Talbot and Oppert—to send to the Society in sealed envelopes independent translations of a newly discovered inscription, and, after comparing the four versions, they were able to announce that there was sufficient agreement between the four to justify belief in what had been achieved and confidence in further progress. The mockery of the learned laity then gradually came to an end, and certainty in the reading of cuneiform documents has advanced enormously since then.

2. A second series of objections is closely connected with an impression which you also have probably not escaped, namely that a number of the solutions achieved by our method of dream-interpretation seem strained, specious, dragged-in—in other words, forced, or even comical or joking. These criticisms are so frequent that I will take at random the last that has come to my ears. Now listen: a head-master in Switzerland—that free country—was recently asked to resign his position on account of his interest in psycho-analysis. He protested and a Berne paper published the decision of the school authorities on his case. I shall quote from the article a few sentences which refer to psycho-analysis: "Further we are amazed at the far-fetched and fictitious character of many of the examples given in the said book by Dr. Pfister of Zurich. . . . It is indeed a matter for surprise that the head-master of a Training College should accept so credulously all these assertions and such specious evidence." These sentences purport to be the final opinion

All that you say is undeniable and yet I do not think it justifies either of your conclusions that dream interpretation as practised by us is at the mercy of the interpreter s arbitrary decisions or that the inadequacy of the results calls in question the correctness of our procedure If for the *arbitrary decision* of the interpreter you will substitute his skill his experience and his understanding then I am with you This kind of personal factor is of course indispensable especially when interpretation is difficult it is just the same in other scientific work however it can t be helped that one man will use any given technique less well or apply it better than another The impression of arbitrariness made for example by the interpretation of symbols is corrected by the reflection that as a rule the connection of the dream thoughts with one another and of the dream with the life of the dreamer and the whole mental situation at the time of the dream points directly to one of all the possible interpretations and renders all the rest useless The conclusion that the imperfect character of the interpretations proceeds from fallacious hypothe es loses its force when consideration shows that on the contrary the ambiguity or indefiniteness of dreams is a quality which we should necessarily expect in them

Let us call to mind our statement that the dream work undertakes a translation of the dream thoughts into a primitive mode of expression analogous to hieroglyphics Now all such primitive systems of expression are neces arily acompanied by ambiguity and indefiniteness but we should not on that account be justified in doubting their practicability You know that the coincidence of opposites in the dream work is analogous to what is called the antithetical sense of primal words in the oldest languages The philolo ist R Abel to whom we owe this information writing in 1884 begs us not on any account to imagine that there was any ambiguity in what one person said to another by means of ambivalent words of this sort On the contrary intonation gestures and the whole context can have left no doubt whatever which of the two opposites the speaker had in mind to convey In writing where gestures are absent the addition of little pictorial signs not meant to receive separate oral expression replaced them e g a drawing of a little man either crouching or stand ng upright according as the ambiguous *ken* of the hieroglyphic meant *weak* or *strong* So that misunderstanding was avoided in spite of the ambiguity of sounds and signs

In ancient systems of expres ion for instance in the scripts of the oldest languages, indefiniteness of various kinds is found with a frequency which we should not tolerate in our writings today Thus in many Semitic writings only the consonants of the word appear the omitted vowels have to be supplied by the reader from his knowledge and from the context Hiero lyphic writing follows a similar principle although not exactly the same and this is the reason why nothin is known of the pronunciation of ancient Egyptian There are besides other kinds of indefiniteness in the acred writings of the Egyptians for example it is left to the writer s choice to inscribe the pictures from right to left or from left to right To be able to read them we have to remember that we must be guided by the direction of the faces of the figures birds and so forth But it was also open to the writer to set the pictures in vertical columns and in the case of inscriptions on smaller objects he was led by considerations of what was plea ing to the eye and of the space at his disposal to introduce still further alterations in the arrangement of the signs The most confusing feature in hieroglyphic script is that there is no pac in between the words The pictures are all placed at equ [illegible] ginning of a new word In Persian cuneiform writing on the other hand a slanting sign i used to separate the words

The Chinese language both spoken and written is exceedingly ancient but is still used today by four hundred million people Don t suppose that I understand it at all I only obtained some information about it becau e I hoped to find in it analogies to the kinds of indefiniteness occurring in dreams nor was I disappointed in my expectation for Chine e is so full of uncertainties as positively to terrify one As is well known it consists of a number of syllabic sound which are pronounced singly or doubled in combination One of the chief dialects has about four hundred of these sounds and since the vocabulary of this dialect is estimated at omewhere about four thousand words it is evident that every sound has an average of ten different meanings—some fewer but some all the more For this reason there are a whole series of devices to escape ambiguity for the context alone will not show

instantly volunteered the nterpretation it mean *auto-erotism* (a term used in ou theory of the lib d signifying grat ficat on obtained w hout any ext rnal love-object) Now was this man allowin himself j k at our expense and pretendin that a pun which occurred to him was part f a dream I do not think so h really did dream t But where does this bewild ring resemblanc between dreams and jokes com from? At one time this quest o took me somewhat out of my way for it necessitated my making a thorough est gation into the question of wit i self This led to the conclusion that wit rminates as follows a preconscious train of thou t is for a moment left to a proces of unconsc ous elaboration, from which t emerges in the form of a wit ticism. While under the influenc f the un con scious t is subject to the mechanisms there operati e—to cond nsation and displac ment that is to sav to the same processes as we found at work in the dream work and the similarity som times found between dreams and wit is t be ascribed t this character common to both. But the unin entional *d eam j ke* does not amuse us as does an ordinary witticism deeper tudy of wit ma how you why this is so The *dream jok* strikes us as a poo form f wit t does not make us laugh, it lea es us cold.

Now in this we are f llowing the path f the ancient method of dream int rpretation, which has given us bes des m ch that s use less many valuable examp e of interpret tio upon which we ours l es ould not improve. I will tell you a dream f historic importance which is rel ted in lightly d erent ersions by Plutarch and Artemidorus of Daldis, the dreamer being Alexander the Great. When he was laying siege to the city of Tyre which was putting up an obstinate resistan (c. 3) he dreamt on night that h saw a dancing sat r Th dream in erpreter Aristand os wh companied the arm o s campaigns in er preted this dream by dividing the w rd *sa-tyro* int Σ T pos (Tyre is thine) d prophesied f m this the king s ct ry over the city This t rpretation d cided Alexand t continue the ege and eventually th city f ll. The int rpretation, f titious as t seems wa un do btedly the right on

3 I can w ll imagin that you will be especially impressed on bein t ld that even peopl wh ha e l g tudied th interpret tion of dreams in the course f their w rk as psycho-analysts ha e raised objections to our conception of dreams It would i deed have been exceptional if so excel ent an opportunity for new mistakes had been let slip and o assert ons ha e been made due to confus on of ideas and based on unju t fia le generaliza tions which are hardly less incorrect than the medical conception of dreams One of these statements you know already that dreams deal with attempts at adaptation to the s tua tion at the m ment and with the solu ion of future problems in other words that they pursue a prospective tendency or aim (A. Maeder) We ha e already demon trated that this tat ment rests upon a confu on between dreams and the latent dream thoughts and ignores the process of dream w k. If those who peak f this "prospective tendency mean thereby to characterize the uncon cious mental activity to which the latent thoughts belong then on the one hand, they tell us nothi g new and, on the other ha d, the de scription is not exhaustive f r the unconscious mental acti ity occupies tself with many other things besides preparat on for the f ure There seems to be a much worse confusion behind the assura ce that the *death clause* may be found underlying every dream I am not quite clear what this formula is intended to mean, but I suspect that behind t the dream is con founded with the whole personal ty of the dreame

An unjustinable general zat on based on a few striking examples is contained in the stat ment that every dream d ts of two kinds f in erpretati on of the kind we ha e described the o-called *psycho-analytic* inte pretation, and the other the o-called *an gogic* which d regards the instinctual tendencies a d aims at representation of the higher mental functions (H Silbere) there are dreams of thi ki d but you will seek in vain to exte d this conception to include even a maj rity of dream Afte all you ha e heard, the tatement that all dreams are t be int rpreted bisexuall as combinat n of two t ndencies whi h may be called male and female (A Adler) will seem to y qui in mprehen ble. Here again in le dreams of this s rt do of course occu and later on you may learn that their stru t re is simila to that f certain hysterical sympt ms. I mention all these discoveries of ew ge ral haracteri tics f dreams in orde to warn yo against them or t lea t to lea you in no d bt bout my own opini n o them

4. At one time the obj ct e value of researc

of One who judges calmly I am much more inclined to think this calm factitious Let us examine the e remarks more closely in the expectation that a certain amount of reflection and knowledge of the subject will do no harm even to a calm judgment

It is really quite refreshing to see how swiftly and unerringly anyone relying merely on his first impressions can arrive at an opinion on some critical question of psychology in its more abstru e aspects The interpretations seem to him far fetched and strained and do not commend themselves to him consequently they are wrong and the whole business is rubbish Such critics never give even a passing thou ht to the possibility that there may be good reasons why the interpretations are bound to convey this very impression—a thought which would lead to the further question what these good reasons are

The circumstance which calls forth this criticism is essentially related to the effect of displacement which you h

rnt to know

the service

ts aid the

ornations which we call allusions are created but these allusions are of a kind not easy to recognize as such nor is it easy to discover the thought proper by working back from them for they are connected with it by the most extraordinary and unusual extrinsic associations But the whole matter throu hout concerns things which are meant to be hidden intended to be concealed that is exactly the object of the dream censorship We must not expect though to find somethin that has been hidden by looking in the very place where it ordinarily belongs The frontier surveillance authorities nowadays are a good deal more cunning in this respect than the Swiss school authorities for they are not content with ex amining portfolios and letter cases when hunt ing for documents and plans but consider the po sibility that spies and smugglers may con ceal anything compromisin about their per sons in places where it is most difficult to detect and where such things certainly do not belong for example between the double soles of their boots If the concealed articles are found there it is certainly true that they have been *dragged* to light but they are none the less a very good *find*

In admitting the possibility that the connec tion between a latent dream element and its manifest substitute may appear most remote and extraordinary sometimes even comical or joking we are guided by our wide experience of instances in which we did not as a rule find the meaning ourselves It is often impossible to arrive at such interpretations by our own efforts no sane person could guess the bridge connecting the two The dreamer either solves the riddle straightaway by a direct association (*he* can do it becau e it is in his mind that the substitute formation originated) or else he provides so much material that there is no longer any need for special penetration in order to solve it—the solution thrusts itself upon us as inevitable If the dreamer does not help us in either of these two ways the manife t element in question will remain for ever in comprehensible Let me give you one more instance of this kind which happened recently A patient of mine lost her father durin the course of the treatment after which she seized every opportunity to bring him back to life in her dreams In one of these her father appeared in a certain connection otherwise not applicable and said *It is quarter past eleven it is half past eleven it is quarter to twelve* For the interpretation of this curious detail she could only provide the as ociation that her father was pleased when his older children were punctual at the midday meal This certainly fitted in with the dream-element but it threw no light on its origin The situation which had just been reached in the treatment gave good grounds for the suspicion that a carefully sup pressed critical anta onism to her much loved and honoured father had played a part in this dream Following out her further association apparently quite remote from the dream she told how she had heard a long discussion of psychological questions on the day before and a relative had said Primitive man (*Urmensch*) survives in all of us Now a light dawns on us Here was again a splendid opportunity for her to imagine that her dead father survived and so in the dream she made him a clock man (*Uhrmensch*) tellin the quarters up to the time of the midday meal

The likeness to a pun in this cannot be ignored and as a matter of fact it has often happened that a dreamer s pun has been as cribed to the interpreter there are yet other examples in which it is not at all easy to decide whether we are dealing with a joke or a dream But you will remember that the same sort of doubt arose with some slips of the tongue A man related as a dream that he and his uncle were sitting in the latter s *auto* (automobile) and his uncle kissed him The dreamer himself

PART III GENERAL THEORY OF NEUROSES

SIXTEENTH LECTURE

PSYCHO-ANALYSIS AND PSYCHIATRY

It pleases me greatly to see you here again to continue our discussions after a year has passed. Last year the subject of my lectures was the application of psycho-analysis to errors and to dreams. I hope this year to lead you to some comprehension of neurotic phenomena which, as you will soon discover, have much in common with both our former subjects. I must tell you before I begin, however, that I cannot concede you the same attitude towards me now as I did last year. Then I endeavoured to make no step without being in agreement with your judgment. I debated a great deal with you, submitted to your objections, in fact, recognized you and your *healthy common sense* as the deciding factor. That is no longer possible, and for a very simple reason. Errors and dreams are phenomena which were familiar to you; one might say you had as much experience of them as I or could easily have obtained it. The manifestations of neurosis, however, are an unknown region to you; those of you who are not yourselves medical men have no access there except through the accounts I give you, and what use is the most excellent judgment where there is no knowledge of the subject under debate?

However, do not receive this announcement as though I were going to give these lectures *ex cathedra* or to demand unconditional acceptance from you. Any such misconception would do me a gross injustice. I do not aim at producing conviction—my aim is to stimulate enquiry and to destroy prejudices. If owing to ignorance of the subject, you are not in a position to adjudicate, then you should neither believe nor reject. You should only listen and allow what I tell you to make its own effect upon you. Convictions are not so easily acquired, or when they are achieved without much trouble, they soon prove worthless and unstable. No one has a right to conviction on these matters who has not worked at the subject for many years as I have and has not himself experienced the same new and astonishing discoveries. Then why these sudden convictions in intellectual matters, lightning conversions and instantaneous repudiations? Do you not see that the *coup de foudre*, love at first sight, proceeds from a very different mental sphere, from the affective one? We do not require even our patients to bring with them any conviction in favour of psycho-analysis or any devotion to it. It would make us suspicious of them. Benevolent scepticism is the attitude in them which we like best. Therefore will you also try to let psycho-analytical conceptions develop quietly in your minds alongside the popular or the psychiatric view until opportunities arise for them to influence each other and be united in a decisive opinion.

On the other hand, you are not for a moment to suppose that the psycho-analytic point of view which I shall lay before you is a speculative system of ideas. On the contrary, it is the result of experience, being founded either on direct observations or on conclusions drawn from observation. Whether these have been drawn in an adequate or a justifiable manner future advances in science will show; after nearly two and a half decades and now that I am fairly well advanced in years I may say without boasting that it was particularly difficult, intense and absorbing work that yielded these observations. I have often had the impression that our opponents were unwilling to consider this source of our statements, as if they looked upon them as ideas derived subjectively which anyone could dispute at his own sweet will. This attitude on the part of my opponents is not quite comprehensible to me. Perhaps it comes from the circumstance that physicians pay so little attention to neurotics and listen so carelessly to what they say that it has become impossible for them to perceive anything in the patients' communications or to make detailed observations from them. I will take this opportunity of assuring you that in these lectures I shall make few controversial references, least of all to individuals. I have never been able to convince myself of the truth of the saying, that strife is the father of all things. I think the source of it was the philosophy of the Greek sophists and that it errs, as does the latter, through the overestimation of dialectics. It seems to me, on the contrary, that scientific controversy so-called is on the whole quite unfruitful, apart from the fact that it is almost always conducted in a highly personal manner. Until a few years

into dreams seemed to be discredited by the fact that patients treated analytically appeared to suit the content of their dreams to the favourite theories of their doctors one class dreaming mainly of sexual impulses and another of impulses for masterv oth t even of servat ple dre u fore there was any such thing as psycho analytic treatment to influence their dreams and that the patients undergoing treatment nowadays also used to dream before they began it The actual fact in this supposedly new observation is soon shown to be self-evident and of no consequence for the theory of dreams The residue from the previous day which gives rise to dreams is a residue from the great interests of waking life If the physician s words and the stimuli which he gives have become of importance to the patient they then enter into whatever constitutes the residue and can act as mental stimuli for dream formation just like other interests of affective value roused on the preceding day which have not subsided they operate in the same way as bodily stimuli which affect the sleeper during sleep Like these other factors inciting dreams the trains of thought roused by the physician can appear in the manifest dream content or be revealed in the latent thoughts We know indeed that dreams can be experimentally produced or to speak more accurately a part of the dream material can be thus introduced into the dream In influencing his patients thus the analyst plays a part no different from that of an experimenter like Mourly Vold who placed in certain positions the limbs of the person upon whom he experimented

We can often influence what a man shall dream *about* but never *what* he will dream for the mechanism of the dream work and the unconscious dream wish are inaccessible to external influence of any sort We realized when we were considering dreams arising out of bodily stimuli that in the reaction to the bodily or mental stimuli brought to bear upon the dreamer the peculiarity and independence of dream life is clearly seen The criticism I have just discussed which tends to cast a doubt upon the objectivity of dream investigation is again an assertion based upon confounding this time confounding dreams with—their material

I wanted to tell you as much as this about the problems of dreams You will guess that I have passed over a great deal and will have discovered for yourselves that my treatment of nearly every point has necessarily been incomplete but this is due to the phenomena of dreams being so closely connected with thos of the neuroses Our plan was to study dreams as an introduction to the study of the neuroses and it was certainly a better one than be inn n the other way about but since dreams prepare us for comprehension of the neuroses so also can a correctly formed estimate of dreams be acquired only after some knowledge of neurotic manifestations has been gained

I do not know how you may think about it but I can assure you that I do not regret having taken up so much of your interest and of the time at our disposal in the consideration of problems connected with dreams I know no other way by which one can so speed

uous work for many months and even years to demonstrate that the symptoms in a case of neurotic illness have a meaning serve a purpose and arise from the patient s experiences in life On the other hand a few hours effort may be enough to show these things in some dream which at first seemed utterly confused and incomprehensible and in this way to confirm all the premises upon which psycho analysis rests—the existence of unconscious mental processes the special mech ms wh

u structure of dreams to that of neurotic symptoms and with that reflect how rapid is the transformation of a dreamer into a wide awake reasonable human be ng we acquire an assurance that the neuroses too dep nd only upon an alteration in the balance of the forces at work in mental life

PART III GENERAL THEORY OF NEUROSES

SIXTEENTH LECTURE

Psycho-Analysis and Psychiatry

It pleases me greatly to see you here again to continue our discussion as after a year has passed. Last year the subject of my lectures was the *application* of psycho-analysis to errors and to dreams. I hope this year to lead you to some comprehension of neurotic phenomena which, as you will soon *discover*, have much in common with both our former subjects. I must tell you before I begin, however, that I cannot concede you the same attitude *towards me* now as I did last year. Then I endeavoured to make no step without being in agreement with your judgment. I debated a great deal with you, submitted to your objections, in fact, recognized you and your *healthy common sense* as the deciding factor. That is no longer possible and for a very simple reason. Errors and dreams are phenomena which were familiar to you; one might say you had as much experience of them as I or could easily have obtained it. The manifestations of neurosis, however, are an unknown region to you; those of you who are not yourselves medical men have no access there except through the accounts I give you, *and of* what use is the most *excellent judgment* where there is no knowledge of the subject under debate?

However, do not receive this announcement as though I were going to give these lectures *ex cathedra* or to demand unconditional acceptance from you. Any such misconception would do me gross injustice. I do not aim to produce conviction—my aim is to stimulate enquiry and to destroy prejudices. If owing to ignorance of the subject you are not in a position to adjudicate, then you should neither believe nor reject. You should only listen and allow what I tell you to make its own effect upon you. Convictions are not so easily acquired, or when they are achieved without much trouble they soon prove worthless and unstable. No one has a right to conviction on these matters who has not worked at this subject for many years as I have and has not himself experienced the same new and astonishing discoveries. Then why these sudden convictions in intellectual matters, these lightning conversions, and instantaneous repudiations? Do you not see that the *coup de foudre*, love at first sight, proceeds from an entirely different mental sphere, from the *affective one*? We do not require even our patients to bring with them any conviction in favour of psycho-analysis or any devotion to it. *It would make* us suspicious of them. Benevolent scepticism is the attitude in them which we like best. Therefore will you also try to let psycho-analytical *conceptions* develop quietly in your minds alongside the popular or the psychiatric view until opportunities arise for them to influence each other and be *united into a decisive* opinion.

On the other hand you are not for a moment to suppose that the psycho-analytic point of view which I shall lay before you is a speculative system of ideas. On the contrary it is the result of experience, being founded either *on direct observations or on conclusions drawn* from observation. Whether these have been drawn in an adequate or a justifiable manner future advances in science will show; after nearly two and a half decades and now that I am fairly well advanced in years I may say without boasting that it was particularly difficult, intense and all-absorbing work that yielded these observations. I have often had the impression that our opponents were unwilling to consider this source of our statements, as if they looked upon them as mere derived subjective ideas which anyone could dispute at his own sweet will. This attitude on the part of my opponents is not quite comprehensible to me. Perhaps it comes from the circumstance that physicians pay so *little attention* to neurotics and listen so carelessly to what they say that it has become impossible for them to perceive anything in the patients' communications or to make detailed observations from them. I will take this opportunity of assuring you that in these lectures I shall make few controversial references, least of all to individuals. I have never been able to convince myself of the truth of the saying that strife is the father of all things. I think the source of it was the philosophy of the Greek sophists and that it errs as does the latter through the overestimation of dialectics. It seems to me on the contrary that scientific controversy so-called on the whole is quite unfruitful, apart from the fact that it almost always conducted in a highly personal manner. Until a few years

ago I could boast that I had only once been engaged in a regular scientific di pute and that with one single investigator Lowenfeld of Munich The end of it was that we became friends and have remained so to this day But I did not repeat the experiment for a very long time because I was not certain that the out come would be the same

Now you will surely judge that a refusal of this kind to discuss matters publicly points to a high degree of inaccessibility to criticism to obstinacy or in the polite colloquialism of the scientific world to *pig headedness* My reply to you would be that should you have arrived at a conviction by means of such hard work you would also thereby derive a certain right to maintain it with some tenacity Further on my own behalf I can say that in the course of my work I have modified my views on im portant points changed them or replaced them by others and have of course in each case published the fact What has been the result of this frankness? Some people have ignored my corrections of myself altogether and still today criticize me in respect of views which no longer mean the same to me Others positively re proach me for these changes and declare me to be unreliable on that account No one who changes his views once or twice deserves to be believed for it is only too likely that he will be mistaken again in his latest assertions but anyone who sticks to anything he has once said or refuses to give way upon it easily enough is obstinate or pig headed is it not so? What is to be done in the face of these self contradic tory criticisms except to remain as one is and behave as seems best to one? This is what I decided to do and I am not deterred from re modelling and improving my theories in ac cordance with later experience I have so far found nothing to alter in my fundamental standpoint and I hope this will never be necessary

So now I have to lay before you the psycho analytic theory of neurotic manifestations For this purpose it will be simplest on account of both the analogy and the contrast to take an example which links up with the phenomena we have already considered I will take a *symp tomatic act* which I see many people commit in my own consulting room The analyst has little to offer to the people who come to a physician s consulting room for half an hour to recount the lifelong misery of their fate His deeper comprehension makes it difficult for him to give as another might the opinion that there is nothing wrong with them and that they had better take a light cour e of hydro therapy One of our colleagues once replied with a shrug when asked how he dealt with consulta tion patients that he fined them so many crowns for wasting the time of the court You will therefore not be surprised to hear that even the busiest psycho analysts are not much sought after for consultations I have had the ordinary door between the waiting room and my consulting room supplemented by another door and covered with felt The reason for this is obvious Now it constantly happens when I admit people from the waiting room that they omit to close these doors leavin even both doors open behind them When I see this hap pen I at once with some stiffness request him or her to go back and make good the omis ion no matter how fine a gentleman he may be or how many hours she has spent on her toilet My action gives the impression of being un called for and pedantic occasionally too I have found myself in the wrong when the person turned out to be one of those who cannot them selves grasp a door handle and are glad when those with them avoid it But in the majority of cases I was right for anyone who behaves in this way and leaves the door of a physician s consulting room open into the waiting room belongs to the rabble and deserves to be re ceived with coldness Now don t allow yourselves to be biased before you have heard the rest This omission on the part of a patient occurs only when he has been waiting alone in the outer room and thus leaves an empty room behind him never when others strangers to him have also been waiting there In the latter case he knows very well that it is to his own interest not to be overheard while he talks to the phy sician and he never ne lects to close both doors carefully

Occuring in this way the patient s omission is neither accidental nor meaningless and not even unimportant for it betrays the visitor s attitude to the physician He belongs to that large class who seek those in high places and wish to be dazzled and intimidated Perhaps he had made enquiries by telephone at what time he would be most likely to gain admit tance and had been expecting to find a crowd of applicants in a queue as if at the grocer s in war time Then he is shown into an empty room wh h [illegible] m [illegible] hc [illegible] ou [illegible] ad been prepared to show him

and so he omits to close the doors between the waiting and the co sulting rooms He intends th to mean Pooh! the e is no one he e and I daresay there won t be however long I stay! H would beha e during the interview in an uncivil and supercil ous manner too if h s presumpt on were not curbed at the outset by a s rp remi der

In the analys s of this little symptomat c ct yo find nothi g that is not already known to you namely the conclus on that it is no a cident but has in it moti e meaning and in t that it bel gs to a mental context

sciousness of the perso who c mes t o t r not one of the patients who left the two doors open would ha e admitted that he wished t show any depreciation f me by his neglect. Many of them could probably recall a ense of disappo tment o e tering the empty waiti g room but the con ectio between this imp ession and th succeeding symptomatic act cer tainly remained outs de the r c nscio sness.

Now let s pl ce this l ttle analysis of a symptomatic act by the d of an observation made o a patient. I will choo e o e which is fresh in my mem ry and also because it can be described in comparati ely few words. A c rtain amount of detail is indispensable for any such account

A young fficer home on h rt lea e of absen a ked me to t eat hi moth in law who was living in the happ est surroundings and y t was emb tt ri g h own a d her family lives by onsensical d a. I fou d h r a

f ctory She cann t say n gh f her hus band s kindne and ons d rat th rs had been l e marri g thirty years a s ce hen they had eve had a cl d a quarrel or m m t s jealousy H tw h ldren ha e both married well but h husb d sense of dutv k eps him till at w k A year before an incred bl and t her i c mprehens bl thing happe d. She re ed a ymous lett r telling he that he c ll t hu band w s ca rying o an intrigue with a y ung gi l, and be lieved t n th spot—s c then h happ ss has been dest oy d The d tails w more or less as follows she had a housemaid with whom sh d scu sed confidential matters perhaps rather too freely This young woman cherished a positi ely ven mous hatred for another g rl who had succeeded better in life than herself although of no better origin. Instead f go ng into serv ce the other young woman had had a commercial tra ning been taken into the fac tory and owing to vacancies caused by the absence of staff on service in the field had been promoted t a good po t on She lived in the f ctory knew all the gentlemen and was even addressed as Miss The other one who had been left beh d in l fe was only too ready to accuse her former schoolmate of all possible evil. One day our patient and her housema d were d scussing an elderly gentleman who had v s ted the house and of whom it was said that he did not l e with his wife but kept a mistress Why she did not know but she suddenly said I cannot imagine anything more awful than to hear that my hu band had a mistress. Th next day she rece ed by post an anonymous letter in d u sed handwriti g which in formed her of the very thing she had just imagined She concluded—probably correctly—that the letter was the hand work of her malicious housema d for the woman who was named s the mi tress of h r husband was the ery gi l who was the object of this housemaid s hatred Altho gh she at once saw through the pl t and had seen e ough of s ch cowardly accusat ons in he own surroundings to place little credence in them ur patient w s nev r th less prostrated by this letter She became t rribly excited and t nce sent for her husband to overwhelm him with reproaches. The husband laughingly den ed the accusation and d d the best thi g he co ld He sent for the family phys cian (who als attended the f c tory) a d he did his best to calm the unhappy lady The n xt thing they d d was also m st reasonabl Th housema d was dism ssed but not th supposed mistre s From that t me on the pat ent laims to ha e repe tedly b ought herself to a calm ew of th matt r s that she n lo ge bel eves th contents of th let t but t has n e go e very d ep nor lasted very l g It was eno gh to hear the young w man s nam menti d or to meet he in th street for a new attack of s p cion agony and rep oaches to b eak out.

This s the ch cal p t e of th excellent w m c se It d d n t req re much experi e ce of psy hi try to pe e e that in tra t to other neu otics she des ribed h symptoms

ago I could boast that I had only once been engaged in a regular scientific dispute and that with one single investigator Lowenfeld of Munich The end of it was that we became friends and have remained so to this day But I did not repeat the experiment for a very long time because I was not certain that the out come would be the same

Now you will surely judge that a refusal of this kind to discuss matters publicly points to a high degree of inaccessibility to criticism to obstinacy or in the polite colloquialism of the scientific world to *pig headedness* My reply to you would be that should you have arrived at a conviction by means of such hard work you would also thereby derive a certain right to maintain it with some tenacity Further on my own behalf I can say that in the course of my work I have modified my views on im portant points changed them or replaced them by others and have of course in each case published the fact What has been the result of this frankness? Some people have ignored my corrections of myself altogether and still today criticize me in respect of views which no longer mean the same to me Others positively re proach me for these changes and declare me to be unreliable on that account No one who changes his views once or twice deserves to be believed for it is only too likely that he will be mistaken again in his latest assertions but anyone who sticks to anything he has once said or refuses to give way upon it easily enough is obstinate or pig headed is it not so? What is to be done in the face of these self contradic tory criticisms except to remain as one is and behave as seems best to one? This is what I decided to do and I am not deterred from re modelling and improving my theories in ac cordance with later experience I have so far found nothing to alter in my fundamental standpoint and I hope this will never be necessary

So now I have to lay before you the psycho analytic theory of neurotic manifestations For this purpose it will be simplest on account of both the analogy and the contrast to take an example which links up with the phenomena we have already considered I will take a *symptomatic act* which I see many people commit in

the lifelong misery of their fate His deeper comprehension makes it difficult for him to give as another might the opinion that there is nothing wrong with them and that they had better take a light course of hydro therapy One of our colleagues once replied with a shrug when asked how he dealt with consulta tion patients that he fined them so many crowns for wasting the time of the court You will therefore not be surprised to hear that even the h

much s

my cor [illegible] room supplemented by another door and covered with felt The reason for this is obvious Now it constantly happens when I admit people from the waiting room that they omit to close these doors leaving even both doors open behind them When I see this hap pen I at once with some stiffness request him or her to go back and make good the omi ion no matter how fine a gentleman he may be or how many hours she has spent on her toilet My action gives the impression of being un called for and pedantic occasionally too I have found myself in the wrong when the person turned out to be one of those who cannot them selves grasp a door handle and are glad when those with them avoid it But in the majority of cases I was right for anyone who behaves in this way and leaves the door of a physician s consulting room open into the waiting room belongs to the rabble and deserves to be re ceived with coldness Now don t allow yourselves to be biased before you have heard the rest This omission on the part of a patient occurs only when he has been waiting alone in the outer room and thus leaves an empty room behind him never when others strangers to him have also been waiting there In the latter case he knows very well that it is to his own interest not to be overheard while he talks to the phy sician and he never neglects to close both doors carefully

Occuring in this way the patient s omission is neither accidental nor meaningless and not even unimportant for it betrays the visitor s attitude to the physician He belongs to that large class who seek those in high places and wish to be dazzled and intimidated Perhaps he had made enquiries by telephone at what time he would be most likely to gain admit tance and had been expecting to find a crowd of applicants in a queue as if at the grocer s in war time Then he is shown into an empty room which moreover is most modestly fur nished and he is dumbfounded He must some how make the physician atone for the superflu ous respect he had been prepared to show him

moved her to seek my assistance. Of this infatuation she herself knew nothing or only perhaps very little; in the circumstances of their relationship it was easily possible for it to disguise itself as harmless tenderness on her part. After what we have already learnt it is not difficult to see into the mind of this good woman and excellent mother. Such an infatuation, such a monstrous impossible thing, could not come into her conscious mind; it persisted nevertheless and unconsciously exerted a heavy pressure. Something had to happen, some sort of relief had to be found, and the simplest alleviation lay in that mechanism of displacement which so regularly plays its part in the formation of delusional jealousy. If not merely the old woman that she was were in love with a young man but if only her old husband too were in love with a young mistress, then her torturing conscience would be absolved from the infidelity. The phantasy of her husband's infidelity was thus a cooling balm on her burning wound. Of her own love she never became conscious, but its reflection in the delusion which brought such advantages thus became compulsive, delusional and conscious. All arguments against it could naturally avail nothing, for they were directed only against the reflection, and not against the original to which its strength was due and which lay buried out of reach in the unconscious.

Let us now piece together the results of this short, obstructed psycho-analytic attempt to understand this case. It is assumed of course that the information acquired was correct, a point which I cannot submit to your judgment here. First of all, the delusion is no longer senseless and incomprehensible; it is sensible, logically motivated, and has its place in connection with an affective experience of the patient. Secondly, it has arisen as a necessary reaction to another mental process which has itself been revealed by other indications, and it owes its delusional character, its quality of resisting real and logical objections, to this relation with this other mental process. It is something desired in itself, a kind of consolation. Thirdly, the fact that the delusion is one of jealousy and no other is unmistakably determined by the experience underlying the disease. You will also recognize the two important analogies with the symptomatic act we analysed, namely the discovery of the sense or intention behind the symptom, and the relation of it to something in the given situation which is unconscious.

This does not of course answer all the questions arising out of this case. On the contrary it bristles with further problems, some of which have not yet proved soluble at all, while others cannot be solved owing to the unfavourable circumstances met with in this case. For instance, why does this happily married lady fall in love with her son-in-law, and why does relief come to her in the form of this kind of reflection, this projection of her own state of mind on to her husband, when other forms of relief were also possible? Do not think that it is idle and uncalled for to propound these questions. We have already a good deal of material at hand to provide possible answers. The patient had come to that critical time of life which brings a sudden and unwelcome increase of sexual desire to a woman; that may have been sufficient in itself. Or there may have been an additional reason in that the sexual capacity of her excellent and faithful husband may have been for some years insufficient for the still vigorous woman's needs. Observation has taught us that it is just such men, whose fidelity is thus a matter of course, who treat their wives with particular tenderness and are unusually considerate of their nervous ailments. Neither is it unimportant, moreover, that the object of this abnormal infatuation should be her daughter's young husband. A strong erotic attachment to the daughter, with its roots in the individual sexual constitution of the mother, often manages to maintain itself in such a transformation. I may perhaps remind you in this connection that the relation between mother-in-law and son-in-law has from time immemorial been regarded by mankind as a particularly sensitive one, which among primitive races has given rise to very powerful taboos and precautions. On the positive as well as on the negative side it frequently exceeds the limits regarded desirable in civilized society. Of these three possible factors, whether one of them has been at work in the case before us, or two of them, or whether all three together have taken part, I cannot tell you, though only because the analysis of the case could not be continued beyond the second hour.

I perceive now that I have been speaking entirely of things which you were not yet prepared to understand. I did so in order to carry out the comparison between psychiatry and psychoanalysis. But I may ask you one thing at this point. Have you observed anything in the nature of a contradiction between the two? Psy

Cf. Totem and Taboo

too mildly—as we say dissimulated them—and that she had never really overcome her belief in the anonymous letter

Now what attitude does a psychiatrist take up to such a case? We know already what he would say to th ——
who does
explains it
k

us lady The sympto matic action appears to be unimportant the symptom calls for notice as a grave mat er Subjectively it involves intense suffering and objectively it threatens to break up a family its claim to psychiatric interest is therefore indisputable First the psychiatrist tries to characterize the symptom by some essential attribute The idea with which this lady tor ments herself cannot be called nonsensical in itself it does happen that elderly husbands contract relationships with young women But there is something else about it that is non sensical and incomprehensible The patient has absolutely no grounds except the anonymous letter for supposing that her loving and faith ful husband belongs to this category of men otherwise not so uncommon She knows that this communication carries no proof she can explain its origin satisfactorily she ought therefore to be able to say to herself that she has no grounds for her jealousy and she does even say so but she suffers just as much as if she regarded her jealousy as well founded Ideas of this kind that are inaccessible to logic and the arguments of reality are unanimously described as *delusions* The good lady suffers therefore from a *delusion of jealousy* That is evidently the essential characteristic of the case

Having established this first point our psy chiatric interest increases When a delusion cannot be dissipated by the facts of reality it probably does not spring from reality Where else then does it spring from? Delusions can have the most various contents why is the content of it in this case jealousy? What kind of people have delusions and particularly de lusions of jealousy? Now we should like to listen to the psychiatrist but he leaves us in the lurch here He considers only one of our ques tions He will examine the family history of this woman and will *perhaps* bring us the an swer that the kind of people who suffer from delusions are those in whose families similar or different disorders have occurred repeatedly In other words this lady has developed a de lusion because she had an hereditary predispo sition to do so That is certainly something but is it all that we want to know? Is it the sole cause of her disease? Does it satisfy us to as sume that it is unimportant arbitrary or in explicable that one kind of delusion should have been developed instead of another? And are we to understand the proposition—that the hereditary predisposition is decisive—also in a negative sense that is that no matter what experiences and emotions life had brought her she was destined some time or other to produce a delusion? You will want to know why scien tific psychiatry gives no further explanation And I reply Only a rogue gives more than he has The psychiatrist knows of no path lead ing to any further explanation in such a ca e He has to content himself with a diagnosis and in spite of wide experience with a very un certain prognosis of its future course

Now can psycho analysis do better than this? Yes certainly I hope to show you that even in such an obscure case as this it is possible to discover something which makes closer com prehension possible First I shall a k you to notice this incomprehensible detail that the anonymous letter on which her delusion is founded was positively provoked by the patient herself by her saying to the scheming house maid the day before that nothing could be more awful than to hear that her husband had an intrigue with a young woman She first put the idea of sending the letter into the servant s mind by this So the delusion acquires a certain independence of the letter it existed before hand as a fear—or as a wish?—in her mind Besides this the further small indications re vealed in the bare two hours of analysis are noteworthy The patient responded very coldly it is true to the request to tell me her further thou hts ideas and recollections after she had finished her story She declared that nothing came to her mind she had told me everything and after two hours the attempt had to be given up because she announced that she felt quite well already and was certain that the morbid idea would not return Her saying this was naturally due to resistance and to the fear of further analysis In these two hours she had let fall some remarks nevertheless which made a certain interpretation not only possible but inevitable and this interpretation threw a sharp light on the origin of the delusion of jealousy There actually existed in her an infatuation for a young man for the very son in law who had

mred her to seek my a..stance On this m f trath s.e herself knew nothing or only per haps very little in the circumstances of their

difficult to see in o the mind of this good woman and excellent mother Such a infatua tion, such a monstrous, impos ble thin could not come i.to her conscious m..d it pers sted, nevertheles. and unconsciou ly exerted a hea y pressure Someth..n had to happen some sort of re f had to be found a d the simplest alleviation lay in that m cha m of displace ment which so regularly plays its part in the formation of delusional jealousy If not m rely she d woman that he wa. were in love with a young man but if onl her old husband too were in love with a young mistress then her t rming conscience would be absol ed from the infid lity The phantasy of her h sband s infidelity was thus a cooling balm on her burning wound. Of her own love she never became conscious but .s reflection in the delus on which brought such advantages thus became compulsive delus al nd conscious. All argu ments ga..st it could naturally ail nothing fo they were directed nly ai st the reflec tion, and not against the original to which its strength was due and which lay buried out of reach in th uncon.cious.

Let us now pi ce together the results of th s sh rt obst cted psycho-analytic attempt to understand this case It s ssumed of course that the inf rmation acquired was correct, a point which I cannot submit to our judgme t here First f all, th d lus on is o longer senseless and in omprehen ble it is sensible logically moti ated, and has ts place in connection with an affecti e experience of the pa tient Secondly t has arisen e essary reaction to anoth r mental process which has itself been revealed by othe ind cations and it owes ts d lu nal characte ts quality of resisting real and l gical objections to this relation with this the m tal process It is something desi ed in self a kind f con.ola tion. Thirdly th f ct that th d lu o is o of jealousy and no oth s unmi.takably determined by the experienc underlying the disease. You will also recognize the two important analogies with the sympt mat c act we ana lysed nam ly th di overy f th sense or intention behind the symptom and the relati of t to something in the gi en situation which is unconscious.

This does n of course answer all the ques tions arising out of this ca e On the contrary it bristles with further problems some of which have not yet proved sol b e at all, while others cannot be sol ed owing to the unfavourable circumstances met with in this case For in sta ce, why does this happily married lady fall in love wi h her son in law and why does relief come to her in the form of this kind of reflection this projection of her own state of mind on to her hu.band when other forms of re f were al.o pos ble? Do not think that it is idle a d uncalled for to propound these q es tions. We have a.ready a good deal of material at ha d to pro ide poss ble answers The pa tient had come to that critical t me of l fe which brings a sudden and unwelcome increase of sexual desire to a woman that may have been sufficient in itse f Or there m y ha e been an additional reason in that the sexual capacity of h r excellent and fa thf l husband may ha e been for some years insufficient for the still igorous woman s needs Observation has taught us that it is just such men whose fidel y is thus a matter of course who treat the r wives wi h particular tenderness and are u usually considerate of their nervous a lments. Ne ther is it unimportant, moreover that the object of this abnormal infatuat on should be her daughter s y ung husband. A strong erotic attachment to the daugh er with its roots in the indi dual sexual constitution of the moth er often manages to maintain i.self n such a transformation I may perhaps remind you in this connection that the rela ion between mothe in law and son n law has from time imm morial been regarded by mankind as a particularly sensiti e one which among primi tive races has gi en rise to very powerful ta boos and precaut ons. On the posit ve as well as on the negative side it frequently exceeds the limits regarded as desirabl in civilized society Of these three pos bl f ctors whether on f them has be at w rk in the case be for us o two f th m, o wheth r all three t g th r h e take part I cannot tell you thou h only because the a alysis of the ca e c ld ot be continued beyond the second h ur

I percei e now that I ha e been speaking en tirel of things which you were not yet prepared to understand. I did so in o der to carry out th comparison betwee psychiatry and psychoanalys.s B t I may a.k you or thing t this point Ha e you observed anythir in the na ture f a c tradictio between the two? Psy

chiatry does not employ the technical methods of psycho analysis neglects any consideration of the content of the delusion and in pointing to heredity gives us but a general and remote aetiology instead of first disclosing the more scientific and immediate one But is any contradiction or opposition contained in this? Is not the one rather a supplement to the other? Is the hereditary factor inconsistent with the importance of experience and would they not both work together most effectively? You will admit that there is nothing essential in the work of psychiatry which could oppose psycho analytic researches It is therefore the psychiatrists who oppose it and not psychiatry itself Psycho analysis stands to psychiatry more or less as histology does to anatomy in one the outer forms of organs are studied in the other th [illegible] tis [illegible] to [illegible] tw [illegible] k of the one is continued in the other You know that nowadays anatomy is the basis of the scientific study of medicine but time was when dissecting human corpses in order to discover the internal structure of the body was as much a matter for severe prohibition as practising psycho analysis in order to discover the internal workings of the human mind seems today to be a matter for condemnation And presumably at a not too distant date we shall have perceived that there can be no psychiatry which is scientifically radical without a thorough knowledge of the deep-seated unconscious processes in mental life

There may be some of you who perhaps are friendly enou h towards psycho analysis often attacked as it is to wish that it would justify itself in another direction also that is therapeutically You know that psychiatric therapy has hitherto been unable to influence delusions Can psycho analysis do so perhaps by reason of its insight into the mechanism of these symptoms? No I have to tell you that it cannot for the present at any rate it is just as powerless as any other therapy to heal these sufferers It is true that we can understand what has happened to the patient but we have no means by which we can make him understand it himself You have heard that I could not continue the analysis of this delusion beyond the first preliminaries Would you then maintain that analysis of such ca es is undesirable because it remains fruitless? I do not think so It is our right yes and our duty to pursue our researches without respect to the immediate gain effected The day will come where and when we know not when every little piece of knowled e will be converted into power and into therapeutic power Even if psycho analysis showed it elf as unsuccessful with all other forms of nervous and mental diseases as with delusions it would still remain justified as an irreplaceable instrument of scientific research It is true that we should not be in a position to practise it the human material on which we learn lives and has its own will and must have its own motives in order to participate in the work and it would then refu e to do so I will therefore close my lecture for today by telling you that there are large groups of nervous disturbances for which this conversion of our own advance in knowledge into therapeutic power has actually been carried out and that with these di eases otherwise so refractory our measures yield under certain conditions results which give place to none in the domain of medical therapy

SEVENTEENTH LECTURE

THE MEANING OF SYMPTOMS

IN THE last lecture I explained to you that clinical psychiatry troubles itself little about the actual form of the individual symptom or the content of it but that psycho analysis has made this its starting point and has ascertained that the *symptom itself has a meaning* and is connected with experiences in the life of the patient The meaning of neurotic symptoms was first discovered by J Breuer in the study and successful cure of a case of hysteria (1880-82) which has since then become famous It is true that P Janet independently reached the same result in fact priority in publication must be granted to the French investigator for Breuer did not publish his observations until more than a decade later (*1893 95*) during the period of our work together Incidentally it is of no great importance to us who made the discovery for you know that every discovery is made more than once and none is made all at once nor is success meted out according to deserts America is not called after Columbus Before Breuer and Janet the great psychiatrist Leuret expressed the opinion that even the delusions of the insane would prove to have some meaning if only we knew how to translate them I confess that for a long time I was willing to accord Janet very h gh recognition for his explanation of neurotic symp-

tem, because he regarded them as expressions of *idées inconscientes* possessing the patient's mind. Since then, however, Janet has taken up an attitude of undue reserve as if he meant to imply that the unconscious had been no thing more to him than a manner of speaking, a makeshift, *une façon de parler*, and that he had nothing "real" in mind. Since then I have not understood Janet's views, but I believe that he has gratuitously deprived himself of great credit.

Neurotic symptoms then, just like errors and dreams, have their meaning, and like these are related to the life of the person in whom they appear. This is an important matter which I would like to demonstrate to you by some examples. I can merely assert, I cannot prove, that it is so in every case; anyone observing for himself will be convinced of it. For certain reasons though, I shall not take these examples from cases of hysteria, but from another very remarkable form of neurosis closely allied in origin to the latter, about which I must say a few preliminary words. This, which we call the *obsessional neurosis*,[1] is not so popular as the widely known *hysteria*; it is, if I may so express myself, not so noisily ostentatious, behaves more as if it were a private affair of the patient's, dispenses almost entirely with bodily manifestations and creates all its symptoms in the mental sphere. The obsessional neurosis and hysteria are the two forms of neurotic disease upon the study of which psycho-analysis was first built up, and in the treatment of which also our therapy celebrates its triumphs. In the obsessional neurosis, however, that mysterious leap from the mental to the physical is absent, and it has really become more intimately comprehensible and transparent to us through psycho-analytic research than hysteria; we have come to understand that it displays far more markedly certain extreme features of the neurotic constitution.

The obsessional neurosis takes this form: the patient's mind is occupied with thoughts that do not really interest him, he feels impulses which seem alien to him, and he is impelled to perform actions which not only afford him no pleasure but from which he is powerless to desist. The thoughts (obsessions) may be meaningless in themselves or only of no interest to the patient; they are often absolutely silly; in every case they are the starting point of a strained concentration of thought which exhausts the patient and to which he yields most unwillingly. Against his will he has to worry and speculate as if it were a matter of life or death to him. The impulses which he perceives within him may seem to be of an equally childish and meaningless character [illegible]

and guards himself [illegible] tions and restrictions against the possibility of carrying them out. As a matter of fact he never literally, not even once, carries these impulses into effect; flight and precautions invariably win. What he does really commit are very [illegible]

necessary actions—going to bed, washing, dressing, going for walks, etc.—to highly laborious tasks of almost insuperable difficulty. The morbid ideas, impulses and actions are not by any means combined in the same proportions in individual types and cases of the obsessional neurosis; on the contrary, the rule is that one or another of these manifestations dominates the picture and gives the disease its name, but what is common to all forms of it is unmistakable enough.

This is a mad disease surely. I don't think [illegible]

something sensible instead of his nonsensical practices. This is what he would like himself, for he is perfectly aware of his condition; he shares your opinion about his obsessional symptoms, he even volunteers it quite readily. Only he simply cannot help himself; the actions performed in an obsessional condition are supported by a kind of energy which probably has no counterpart in normal mental life. Only one thing is open to him—he can displace and he can exchange; instead of one silly idea he can adopt another of a slightly milder character; from one precaution or prohibition he can proceed to another; instead of one ceremonial rite he can perform another. He can displace his sense of compulsion, but he cannot dispel it. This capacity for displacing all the symptoms,

[1] Sometimes called in English "compulsion-neurosis."

involving radical alteration of their original forms is a main characteristic of the disease it is moreover striking that in this condition the *opposite values (polarities)* pervading mental life appear to be exceptionally sharply differentiated In addition to compulsions of both positive and negative character doubt appears in the intellectual sphere gradually spreading until it gnaws even at what is usually held to be certain All these things combine to bring about an ever increasing indecisiveness loss of energy and curtailment of freedom and that although the obsessional neurotic is originally always a person of a very energetic disposition often highly opinionated and as a rule intellectually gifted above the average He has usually attained to an agreeably high standard of ethical development is over conscientious and more than usually correct You may imagine that it is a sufficiently arduous task to find one's bearings in this maze of contradictory character traits and morbid manifestations At the moment our aim is merely to interpret some symptoms of this disease

Perhaps in view of our previous discussions you would like to know what present day psychiatry has to offer concerning the obsessional neurosis it is but a miserable contribution however Psychiatry has given names to the various compulsions and has nothing more to say about them It asserts instead that persons exhibiting these symptoms are *degenerate* That is not much satisfaction to us it is no more than an estimate of their value a condemnation instead of an explanation We are intended I suppose to conclude that deterioration from type would naturally produce all kinds of oddities in people Now we do believe that people who develop such symptoms must be somewhat different in type from other human beings but we should like to know whether they are more *degenerate* than other nervous patients than hysterical or insane people The characterization is clearly again much too general One may even doubt whether it is justified at all when one learns that such symptoms occur in men and women of exceptional ability who have left their mark on their generation Thanks to their own discretion and the untruthfulness of biographers we usually learn very little of an intimate nature about our exemplary great men but it does happen occasionally that one of them is a fanatic about truth like Emile Zola and then we hear of the many extraordinary obsessive habits from which he suffered throughout life

Psychiatry has got out of this difficulty by dubbing these people *dégénerés superieurs* Very well but psycho analysis has shown that these extraordinary obsessional symptoms can be removed permanently like the symptoms of other diseases and as in other people who are not degenerate I myself have frequently succeeded in doing so

I shall only give you two examples of analysis of obsessional symptoms one is an old one but I have never found a better and one is a recent one I shall limit myself to these two because an account of this kind must be very explicit and go into great detail

A lady of nearly thirty years of age suffered from very severe obsessional symptoms I might perhaps have been able to help her if my work had not been destroyed by the caprice of fate—perhaps I shall tell you about it later In the course of a day she would perform the following peculiar obsessive act among others several times over She would run out of her room into the adjoining one there take up a certain position at the table in the center of the room ring for her maid give her a trivial order or send her away without and then run back again There was certainly nothing very dreadful about this but it might well arouse curiosity The explanation presented itself in the simplest and most unexceptionable manner without any assistance on the part of the analyst I cannot imagine how I could even have suspected the meaning of this obsession or could possibly have suggested an interpretation for it Every time I had asked the patient Why do you do this? What is the meaning of it? she had answered I don't know But one day after I had succeeded in overcoming a great hesitation on her part involving a matter of principle she suddenly did know for she related the history of the obsessive act More than ten years previously she had married a man very much older than herself who had proved impotent on the wedding night Innumerable times on that night he had run out of his room into hers in order to make the attempt but had failed every time In the morning he had said angrily It's enough to disgrace one in the eyes of the maid who does the beds and seizing a bottle of red ink which happened to be at hand he poured it on the sheet but not exactly in the place where such a mark might have been At first I did not understand what this recollec

E To lo se *Em le Z la E quête m d c p y h l g que* (P s 1896)

tion could have to do with the obses e act in ques o for I cou d see no similarity between the two s tuations, except in the running f om one room into the other and perhaps also in the ppearance of the servant on the scene The pa ient then led me to the table in the adjoin ng room where I found a great mark on the table-cover She explained further that he stood by the table in such a way that when the maid came in s e could not m ss seeing this mark. After th s there could no longer be any doubt bout the connect on between the cur rent obsess e ct and the scene of the wedding night, thou h there was still a great deal to learn about it.

I was clear first of all that the patient identified herself with her husband in mitat ng his running from one room into another s e acted his part. To keep up the s milarity w mu t assume that h has s bstituted the tabl and table-cover f r the bed a d sheet This might seem too arb trary but then we have ot studi d dream symboli m in vain In dreams a tabl is ery often found to represent a bed. *Bed and b ard* t gether mean marriage so that the one ea ly stands for th other

All this would be proof e ugh that the obsessive act is f ll f meaning it *seems* to be a representation, a repetition of that all important scen But we a not bound to t p at this semblanc if we in estigate more losely the rela between the two tuations we hall probably find t somethi g m re the p rpose of the bsessi e ct The kernel of it ev dently lies in th calling of th maid, to whom she displays th ma k, in c trast to he husb d s words "It s eno gh to di grac o e bef re the serva t. In this w y he whose part sh is playing is *not* ashamed before *the serva t* the stain wher t ght to be W see the efore that he has not simply repeated the scen she has o tin ed t and rrected t transformed it into what t o ght to h ve bee This mpl s something lse too a correctio of th c rcum stanc which m d that ght o distres ng

dream she ep e t this wi h f lfill d in a curr t obsess t which erve the pur pose

points to this nterpretat on of the obsessive act in itself so incomprehensible She had been separated from her husband for years and was trying to make up her m nd to divorce him legally But there would have been no prospect of being free from him in her mind she forced herself to be true to h m. She withdrew from the world and from everyone so that he might not be tempted and in her phantasies h ex cused and idealized him. The deepest secret of her illness was that it enabled her to shield him from malicious gossip to justify her separation from him and to make a comfortable existence apart from her po sible for him. The analysis of a harmless obsessive act thus leads stra ght to th inmost core of the patient s disease, and at the same time betrays a great deal of the secret of the obsess onal neurosis in general. I am quite willing that you should spend some t me ove this example for it unites condit ons which cannot rea onably be expected in all cases The interpret t on of the symptom was di covered by the pat ent herself in a flash without guidance or interference from the ana lyst and t had an en in connection with an event which did not belong as it commonly does to a forgotten period in childhood but which *had occurred in the patient s adult l fe* and was clear in her memory All those obj ctions wh ch critics hab tually raise a ainst our interpreta tio s of symptoms are quite out of place here To be sure we cannot lways be so fortunate.

And one thi g more! H s it not struck you that th s innoce t obsess e act leads d rectly to this lady s most pri ate aff rs A woman can hardly ha e anything mo e intimate to r lat than the story of her wedd n ght and i t by chance a d without special sign f cance that we are led stra ght to the nnermost secrets f he sexual life? It m ght cert nly be due to the cho ce I made of this example Let us not de ide th s point too quickly but l t us turn to the eco d exampl which is of a totally diff re t nature and belongs to a ery com mon type that of tuals preparat ry t leep

A w ll gr n clever girl of 19 the only ch ld of her parents upen r t them in education and int ll ctual act vity was a wild h gh pir ited child b t f l te years had become very n rv s w thout a y ppar nt c use She was very irrit bl particula l w th he m ther was di cont ted and depressed incl ned to indecis n a d d bt finally confess g that she could no l g r walk alone th u h squares and w de t ts We will n t go very closely into her c mplicated co dit on which requires at

least two diagnoses agoraphobia and obsessional neurosis but will turn our attention to the ritual elaborated by this young girl preparatory to going to bed as a result of which she caused her parents great distress In a certain sense every normal person may be said to carry out a ritual before going to sleep or at least he requires certain conditions without which he is hindered in going to sleep the transition from waking life to sleep has been made into a regular formula which is repeated every night in the same manner But everything that a healthy person requires as a condition of sleep can be rationally explained and if the external circumstances make any alteration necessary he adapts himself easily to it without waste of time The morbid ritual on the other hand is inexorable it will be maintained at the greatest sacrifices it is disguised too under rational motives and appears superficially to differ from the normal only in a certain exaggerated carefulness of execution On a closer examination however it is clear that the disguise is insufficient that the ritual includes observances which go far beyond what reason can justify and even some which directly contravene this As the motive of her nightly precautions our patient declares that she must have silence at night and must exclude all possibility of noise She does two things for this purpose she stops the large clock in her room and removes all other clocks out of the room including even the tiny wrist watch on her bed table Flower pots and vases are placed carefully together on the writing table so that they cannot fall down in the night and break and so disturb her sleep She knows that these precautions have only an illusory justification in the demand for quiet the ticking of the little watch could not be heard even if it lay on the table by the bed and we all know that the regular ticking of a pendulum clock never disturbs sleep but is more likely to induce it She also admits that her fear that the flower pots and vases if left in their places at night might fall down of themselves and break is utterly improbable For some other practices in her ritual this insistence upon silence as a motive is dropped indeed by ordaining that the door between her bedroom and that of her parents shall remain half open (a condition which she ensures by placing various objects in the door way) she seems on the contrary to open the way to sources of noise The most important observances are concerned with the bed itself however The bolster at the head of the bed must not touch the back of the wooden bedstead The pillow must lie across the bolster exactly in a diagonal position and in no other she then places her head exactly in the middle of this diamond lengthways The eiderdown must be shaken before she puts it over her so that all the feathers sink to the foot-end she never fails however to press this out and redistribute them all over it again

I will pass over other trivial details of her ritual they would teach us nothing new and lead us too far from our purpose Do not suppose though that all this is carried out with perfect smoothness Everything is accompanied by the anxiety that it has not all been done properly it must be tested and repeated her doubts fix first upon one then another of the precautions and the result is that one or two hours elapse before the girl herself can sleep or lets the intimidated parents sleep

The analysis of these torments did not proceed so simply as that of the former patient's obsessive act I had to offer hints and suggestions of its interpretation which were invariably received by her with a positive denial or with scornful doubt After this first reaction of rejection however there followed a period in which she herself took up the possibilities suggested to her noted the associations they aroused produced memories and established connections until she herself had accepted all the interpretations in working them out for herself In proportion as she did this she began to relax the performance of her obsessive precautions and before the end of the treatment she had given up the whole ritual I must also tell you that analytic work as we conduct it nowadays definitely excludes any uninterrupted concentration on a single symptom until its meaning becomes fully clear It is necessary on the contrary to abandon a given theme again and again in the assurance that one will come upon it anew in another context The interpretation of the symptom which I am now going to tell you is therefore a synthesis of the results which amid the interruptions of work on other points took weeks and months to procure

The patient gradually learnt to understand that she banished clocks and watches from her room at night because they were symbols of the female genitals Clocks which we know may have other symbolic meanings beside this, acquire this significance of a genital organ by their relation to periodical processes and regular intervals A woman may be heard to boast

parable to the throbbing of the clitoris in its male excitation. This sensation, which was distressing to her, had actually on several occasions wakened her from sleep, and now her fear of an erection of the clitoris expressed itself by the imposition of a rule to remove all going clocks and watches far away *from her* during the night. Flower pots and vases are, like all receptacles, also symbols of the female genitals. Precautions to prevent them from falling and breaking during the night are therefore not lacking in meaning. We know the very widespread custom of breaking a vessel or a plate on the occasion of a betrothal. Everyone present possesses himself of a fragment in symbolic acceptance of the fact *that he may no longer* put forward any claim to the bride, presumably a custom which arose with monogamy. The patient also contributed a recollection and several associations to this part of her ritual. Once as a child she had fallen while carrying a glass or porcelain vessel, and had cut her finger which had bled badly. As she grew up and learnt the facts about sexual intercourse, she developed the apprehensions that on that bridal night she would not bleed and so would prove not to be a virgin. Her precaution against the vases breaking signified a rejection of the whole complex concerned with virginity and with the question of bleeding during the first act of intercourse, a rejection of the anxiety both that she would bleed and that she would not bleed. These precautions were in fact only remotely connected with the prevention of noise.

One day she divined the central idea of her ritual when she suddenly understood her rule not to let the bolster touch the back of the bed. The bolster had always seemed a woman to her, she said, and the upright back of the bed a man. She wished therefore by a magic ceremony as it were, to keep man and woman apart, that is to say, to separate the parents, and prevent intercourse from occurring. Years before the institution of her ritual she had attempted to achieve this end by a more direct method. She had simulated fear, or made use of an exhibited tendency to fear, so that the door between her bedroom and that of her parents should not be closed. This regulation was still actually included in her present ritual. In this way she managed to make it possible to overhear her parents, a proceeding which at one time had caused her months of sleeplessness. Not content with disturbing her parents in this way, she at that time even succeeded occasionally in sleeping between the father and mother in their bed. *Bolster* and *bedstead* were then really prevented from coming together. As she finally grew *too big to be comfortable* in the same bed with the parents, she achieved the same thing by consciously *simulating fear* and getting her mother to change places with her and to give up to her her place by the father. This incident was undoubtedly the starting point of phantasies, the effect of which was evident in the ritual.

If the bolster was a woman, then the shaking of the eiderdown till all the feathers were at the bottom, making a protuberance there, also had a meaning. It meant impregnating a woman. She did not neglect, though, to obliterate the pregnancy again, for she had for years been terrified that intercourse between her parents might result in another child and present her with a rival. On the other hand, if the larger bolster meant the mother, then the small pillow could only represent the daughter. Why had this pillow to be placed diamond-wise upon the bolster and her head be laid exactly in its middle lengthwise? She was easily reminded that a diamond is repeatedly used in drawings on walls to signify the open female genitals. The part of the man (the father) she thus played herself and replaced the male organ by her own head. (Cf. Symbolism of beheading for castration.)

Horrible thoughts, you will say, to run in the mind of a virgin girl. I admit that, but do not forget that I have not invented these ideas, only exposed them. A ritual of this kind before sleep is also peculiar enough, and you cannot deny the correspondence revealed by the interpretation between the ceremonies and the phantasies. It is more important to me, however, that you should notice that the ritual was the outcome not of a single phantasy, but of several together, which of course must have had a nodal point somewhere. Note too, that the details of the ritual reflect the sexual wishes both positively and negatively, and serve in part as expressions of them, in part as defences against them.

It would be possible to obtain much more out of the analysis *of this ritual* by bringing it into its place in connection with the patient's other symptoms. But that is not our purpose at the moment. You must be content with a reference to an erotic attachment to the father

originating very early in childhood which had enslaved this girl It was perhaps for this reason that she was so unfriendly towards her mother Also we cannot overlook the fact that the analysis of this symptom has again led to the patient s sexual life The more insi ht we gain into the meaning and purpose of neurotic symptoms the less surprising will this seem

From two selected examples I have now shown you that neurotic symptoms have meaning like errors and like dreams and that they are closely connected with the events of the patient s life Can I expect you to believe this exceptionally significant statement on the strength of two examples? No But can you expect me to go on quoting examples to you until you declare yourselves convinced? Again no for in view of the exhaustive treatment given to each individual case I should have to devote five hours a week for a whole term to the consideration of this one point in the theory of the neuroses I will content myself therefo e with the sampl s given as evidence of my statement and will refer you for more to the literature on the subject to the classical interpretation of symptoms in Breuer s first case (hysteria) to the striking elucidations of very obscure symptoms in dementia praecox so-called made by C G Jung at a time when this investigator was a mere psycho analyst and did not yet aspire to be a prophet and to all the subseque [illegible]

[illegible] to psycho analysts that in comparison they have temporarily neglected the other problems of the neuroses

Any one of you who makes the necessary effort to look up this question will certainly be strongly impressed by the wealth of evidential material But he will also meet with a difficulty The meaning of a symptom lies as we have seen in its connection with the life of the patient The more individually the symptom has been formed the more clearly may we expect to establish this connection Then the task resolves itself specifically into a discovery for every nonsensical idea and every useless action of the past situation in which the idea was justified and the action served a useful purpose The obsessive act of the patient who ran to the table and rang for the maid is a perfect model of this kind of symptom But symptoms of quite a different type are very frequently seen They are what we call *typical* symptoms of a disease in each case they are practically identical the individual differences in them vanish or at least fade away so that it is difficult to connect them with the patient s life or to relate them to special situations in his past Let us consider the obsessional neurosis again The second patient s ceremonies preparatory to sleep are in many ways quite typical althou h showing enou h individual features as well to make an historical interpretation so to speak, possible But all obsessional patients are given to repetitions to isolating certain of their actions and to rhythmic performances Most of them wash too much Those patients who suffer from agoraphobia (topophobia fear of pace) no longer reckoned as an obsessional neurosis but now classified as anxiety hysteria reproduce the same features of the pathological picture often with fatiguin monotony They fear enclosed spaces wide open squares long stretches of road and avenues they feel protected if accompanied or if a vehicle drives behind them and so on Nevertheless on this groundwork of similarity the various patients construct individual conditions of their own moods one might call them which directly contrast with other cases One fears narrow streets only another wide streets only one can walk only when few people are about others only when surrounded with people Similarly in hysteria beside the wealth of individual features there are always plenty of common typical symptoms which appear to resist an easy interpretation on historical lines Do not let us forget that it is these typical symptoms which enable us to take our bearings in forming a diagnosis Supposing we do trace back a typical symptom in a case of hysteria to an experience or to a chain of similar experiences (for instance an hysterical vomiting to a series of impressions of a disgusting nature) it will be confusing to discover in another case of vomiting an entirely dissimilar series of apparently causative experiences It almost looks as though hysterical patients must vomit for some unknown reason and as though the historical factors revealed by analysis were but pretexts seized upon by an inner necessity when opportunity offered to serve its purpose

This brings us to the d scouraging conclusion that although individual forms of neurotic symptoms can certainly be satisfactorily explained by their relation to the patient s experiences yet our science fails us for the far more frequent typical symptoms in the same cases In addition to this I have not nearly

explained to you all the difficulties that arise during a resolute pursu t of the h storical mea ng of a symptom No shall I do o for al t.ough my tentio is to conceal nothing from yo and to glos o e noth I do not need to con e you and stupefy ou at the out et of ou studies togeth r It is tru that ou u der sta.ding of symptom nterpret t on ha only j.t begun, but w will hold fa t to the knowl edge gained and proceed to o ercome step by ep the difficult es of the unknown I will try to heer you w th the *thought that it is hardly* pos.b e to presume fundamental d fference betwee the on kind of symptom and the oth r If the indi dual form of symptom is o unmistakably conn cted with the patient s ex periences it is po ble that the typ cal symptom relates to an experie e which is itself typ cal a d commo to all humanity Other r gu la ly recurring features of a neuro uch as the repetiti and doubt of the ob e sonal neu rosis may be uni ersal re ct ons wh ch th p t ent is compell d to e ggerate by the n ture of th m b d hange I short the e is no reaso to g e up hastily in de pa r let us see what m re we can fi d t

EIGHTEENTH LECTURE

FIXATION UPON TRAUMAS THE UNCONSCIOUS

I SAID last time th t w would take a tart ing-point fo furth r wo k the knowl dge we have gai ed already and not the d ubts which it has ro sed n us *We have not yet e en be* gun to d scuss two of the most interesting con clu o s aris ng from the analysis of the two examples

First both the pat e ts gi e *the impression* that they are *fixed to* a part cular po nt in their pa t that th y do not know how to release themsel es from it and are consequentl alien ated from both present a d future They are marooned in the r illnes as it were just as in *former* times people used to withdraw to the clo ter to l ve out the r unhappy fate there In the ca.e of the first pat ent it was the mar ria e to the husband which i reality had long a o come to an end that had settled th s doom upon her Her symptoms enabled her to con t nue her relat on h p w th h m we could pe cei e in them the vo ces which pleaded f h m excu.ed him exal ed h m lamented h s loss Althou.h she i youn and co ld attr ct other men he has seized upon every po .ible real and maginary (mag cal) prec u t on that will preserve her fidel ty to him She w ll not meet strangers she neglects her ap pe rance moreover she can ot read ly rise f m any chair wh ch he sits upon and she refuses to s gn he name and can gi e no pre- t becau e n one mu.t have a yth n. wh ch i hers

W th the sec nd pat ent the youn girl it i the erotic attachme t to the father estab hed in the years before puberty that pla s th s part i her l fe She lso has herself pe cei ed that he can t m rry as long as she so ll We m pect that he became o ll in o d r to be n ble to marry d so to remain w th her fathe

We cann t avo d aski g the que tion how by what means d impelled by what mot es yo e can take p ch an extrao d nary and u p ofit ble att tud towards l fe Prov d d th t is that this att tud is a un ersal charac ter of e o s and not a pe ial pecul rity f the e t o pat ts As m tte of fact th is t s a un e s l tra t commo to every eu o s a d o e of great p ctical gnifica ce B e r s first hyste c l patie t was *fixated* in the sam way *to the t me when he* father was take up the normal car e of a w man In every on of our p tients we l arn th ugh an lysis th t the symptom and the r effects have set

the sufferer back into some past period of his life In the majority of cases it is actually a very early phase of the life history which has been thus selected a period in childhood even absurd as it may sound the period of existence as a suckling infant

The closest analogy to this behaviour in our nervous patients is provided by the forms of illness recently made so common by the war—the so called *traumatic neuroses* Of course similar cases have occurred before the war after railway accidents and other terrifying experiences involving danger to life The traumatic neuroses are not fundamentally the same as those which occur spontaneously which we investigate analytically and are accustomed to treat neither have we been successful so far in correlating them with our views on other subjects later on I hope to show you where this limitation lies Yet there is a complete agreement between them on one point which may be emphasized The traumatic neuroses demonstrate very clearly that a fixation to the moment of the traumatic occurrence lies at their root These patients regularly produce the traumatic situation in their dreams in cases showing attacks of an hysterical type in which analysis is possible it appears that the attack constitutes a complete reproduction of this situation It is as though these persons had not yet been able to deal adequately with the situation as if this task were still actually before them unaccomplished We take this attitude of theirs in all seriousness it points the way to what we may call an *economic* conception of the mental processes The term *traumatic* has actually no other meaning but this *economic* one An experience which we call traumatic is one which within a very short space of time subjects the mind to such a very high increase of stimulation that assimilation or elaboration of it can no longer be effected by normal means so that lasting disturbances must result in the distribution of the available energy in the mind

This analogy tempts us also to classify as traumatic those experiences to which our nervous patients seem to be fixated In this way we should be provided with a simple condition for a neurotic illness it would be incomparable to a traumatic illness and would result from an incapacity to deal with an overpowering affective experience Indeed the first formula in which Breuer and I in 1893 95 reduced our new observations to a theory was expressed very similarly A case like that of the first patient described the young woman separated from her husband fits very well into this description she had not been able to get over the impracticability of her marriage and was still attached to her trauma But the second case of the young girl who was tied to her father shows us at once that the formula is not comprehensive enough On the one hand an infantile adoration of her father by a little girl is such a common experience and so frequently grown out of that the term *traumatic* would lose all its meaning if applied to it on the other hand the history of the case shows that this first erotic fixation was gone through by the patient quite harmlessly at the time to all appearances and only several years later came to expression in the obsessional neurosis So we see that there are complications ahead a considerable variety and number of determining factors in neurosis but we divine that the traumatic view will not necessarily be abandoned as false and that it will fit in and have to be co ordinated properly elsewhere

Here again we must leave the path we have been following At the moment it will take us no further and we have much more to learn before we can find a satisfactory continuation of it But before leaving the subject of fixation to traumas it should be noted that it is a phenomenon manifested extensively outside the neuroses every neurosis contains such a fixation but not every fixation leads to a neurosis or is necessarily combined with a neurosis or arises in the course of a neurosis Grief is a prototype and perfect example of an affective fixation upon something that is past and like the neuroses it also involves a state of complete alienation from the present and the future But even the lay public distinguishes clearly between grief and neurosis On the other hand there are neuroses which may be described as morbid forms of grief

It does also happen that persons may be brought to a complete standstill in life by a traumatic experience which has shaken the whole structure of their lives to the foundations so that they give up all interest in the present and the future and live permanently absorbed in their retrospections but these unhappy persons do not necessarily become neurotic Therefore this single feature must not be overestimated as a characteristic of neurosis however invariable and significant it may be otherwise

Now let us turn to the second conclusion to be drawn from our analyses it is one upon

which we shall not need to impose any subsequent limitation. With the first patient we have heard of the senseless obsessive act she performed and of the intimate memories she recalled in connection with it; we also considered the relation between the two and deduced the purpose of the obsessive act from its connection with the memories. But there is one factor which we have entirely neglected, and yet it is one which deserves our fullest attention. As long as the patient continued this performance she did not know that it was in any way connected with the previous experience; the connection between the two things was hidden; she could quite truly answer that she did not know what impulse led her to do it. Then it happened suddenly that under the influence of the treatment, she found this connection and was able to tell it. But even then she knew nothing of the purpose she had in performing the action, the purpose that was to correct a painful event of the past and to raise the husband she loved in her own estimation. It took a long time and much effort for her to grasp and admit to me that such a motive as this alone could have been the driving force behind the obsessive act.

The connection with the scene on the morning after the unhappy bridal night and the patient's own tender feeling for her husband, together make up what we have called the *meaning of the obsessive act.* But both sides of this meaning were hidden from her; she understood neither the *whence* nor the *whither* of her act, as long as she carried it on. Mental processes had been at work in her, therefore, of which the obsessive act was the effect; she was aware in a normal manner of the effect, but nothing of the mental antecedents of this effect had come to the knowledge of her consciousness. She was behaving exactly like a subject under hypnotism whom Bernheim had ordered to open an umbrella in the ward five minutes after he awoke, but who had no idea why he was doing it. This is the kind of occurrence we have in mind when we speak of the existence of *unconscious mental processes.* We may challenge anyone in the world to give a more correctly scientific explanation of this matter and will then gladly withdraw our inference that unconscious mental processes exist. Until they do, however, we will adhere to this inference and, when anyone objects that in a scientific sense the unconscious has no reality, that it is a mere makeshift, *une façon de parler*, we must resign ourselves with a shrug to rejecting his statement as incomprehensible. Something unreal which can nevertheless produce something so real and palpable as an obsessive action!

In the second patient fundamentally the same thing is found. She has created a rule that the bolster must not touch the back of the bedstead, and *she had to carry out this rule* but she does not know whence it comes, what it means, or to what it owes its strength. Whether she regards it indifferently or struggles against it, or rages against it or determines to overcome it matters not; it will be followed. It must *be followed; in vain she asks herself why.* It is undeniable that these symptoms of the obsessional neurosis, these ideas and these impulses which arise no man knows where and which oppose such a powerful resistance against all the influences to which an otherwise normal mental life is susceptible, give the impres- [illegible] of being

indication of a special sphere of mental activity *cut off from all the rest.* They show the way unmistakably to conviction on the question of the unconscious in the mind, and for that very reason clinical psychiatry, which only recognizes a psychology of consciousness, can do nothing with these symptoms except to *stigmatize them as signs of a special kind of degeneration.* Naturally the obsessive ideas and impulses are not themselves unconscious any more than is the performance of the obsessive act. They would not have become symptoms if they had not penetrated into consciousness. But the mental antecedents of them disclosed by analysis, the connections into which they fit after interpretation are unconscious at least until the time when we make the patient conscious of them by the work of the analysis.

Consider now in addition that the facts established in these two cases are confirmed in every symptom of every neurotic disease; that always and everywhere the meaning of the symptoms is unknown to the sufferer; that analysis invariably shows that these symptoms are derived from unconscious mental processes which can, however, under various favorable conditions become conscious. You will then understand that we cannot dispense with the unconscious part of the mind in psycho-analysis and that we are accustomed to deal with it as with something actual and tangible. Perhaps you will also be able to realize how unfitted all

those who only know the unconscious as a phrase who have never analysed never interpreted dreams or translated neurotic symptoms into their meaning and intention are to form an opinion on this matter I will repeat the substance of it a ain in order to impress it upon you The fact that it is possible to find meaning in neurotic symptoms by means of analytic interpretation is an irrefutable proof of the existence—or if you prefer it of the necessity for assuming the existence—of un con cious mental processes

But that is not all Thanks to a second discovery of Breuer s for which he alone deserves credit and which seems to me even more far reaching in its significance than the first more still has been learnt about the relation between the unconscious and the symptoms of neurotics Not merely is the meaning of the symptom invariably unconscious there exists also a connection of a substitutive nature between the two the existence of the symptom is only possible by reason of this unconscious activity You will soon understand what I mean With Breuer I maintain the following Every time we meet with a symptom we may conclude that definite unconscious activities which contain the meaning of the symptom are present in the patient s mind Conversely this meaning must be unconscious before a symptom can arise from it Symptoms are not produced by conscious processes as soon as the unconscious processes involved are made conscious the symptom must vanish You will perceive at once that here is an opening for therapy a way by which symptoms can be made to disappear It was by this means that Breuer actually achieved the recovery of his patient that is freed her from her symptoms he found a method of bringing into her consciousness the uncon cious processes which contained the meaning of her symptoms and the symptoms vanished

This discovery of Breuer s was not the result of any speculation but of a fortunate observation made possible by the co operation of the patient Now you must not rack your brains to try and understand this by seeking to compare it with something similar that is already familiar to you but you must recognize in it a fundamentally new fact by means of which much else becomes explicable Allow me therefore to express it again to you in other words

The symptom is formed as a substitute for something else which remains submerged Certain mental processes would under normal conditions develop until the person became aware of them consciously This has not happened and instead the symptom has arisen out of these processes which have been interrupted and interfered with in some way and have had to remain unconscious Thus something in the nature of an exchange *has occurred if we can* succeed in reversing this process by our therapy we shall have performed our task of dispersing the symptom

Breuer s discovery still remains the foundation of psycho analytic therapy The propo ition that symptoms vanish when their unconscious antecedents have been made conscious has been borne out by all subsequent research although the most extraordinary and unexpected complications are met with in attempting to carry this proposition out in practice Our therapy does its work by transforming something unconscious into something conscious and only succeeds in its work in so far as it is able to effect this transformation

Now for a rapid digression lest you should run the risk of imagining that this therapeutic effect is achieved too easily According to the conclusions we have reached so far neurosis would be the result of a kind of ignorance a not knowing of mental processes which should be known This would approach very closely to the well known Socratic doctrine according to which even vice is the result of ignorance Now it happens in analysis that an experienced practitioner can usually surmise very easily what those feelings are which have remained unconscious in each individual patient It should not therefore be a matter of great difficulty to cure the patient by imparting his knowledge to him and so relieving his ignorance At least one side of the unconscious meaning of the symptom would be ea ily dealt with in this way although it is true that the other side of it the connection between the symptom and the previous experiences in the patient s life can hardly be divined thus for the analyst does not know what the experiences have been he has to wait till the patient remembers them and tells him But one might find a substitute even for this in many cases One might ask for information about his past life from the friends and relations they are often in a position to know what events have been of a traumatic nature perhaps they can even relate some of which the patient is ignorant because they took place at some very early period of childhood By a combination of these two means it would seem that the pathogenic ignorance of the pa

tients mi ht be overcome in a hort time with o t m ch trouble

If onl t were so! But we have made d s coveries that we were qu te u prepared for at first. There is knowing and knowing they are not always the me thing There are various kinds of knowing which psychologically are n t by any means of equal value *Il y a fagots et f go* as Moliere says Knowing on the part of the phy cian not the same thing as knowin on the part of the pati nt and does not have the same effect. When the ph sician conveys his knowledge to the pat ent by tell ing him what he knows it ha effect No it would be incorrect to say that It does not ha e the effect of dispers n the symptoms but it has a differen one t s ts the anal s s in motion, and the first result of this is often an energetic denial. The patient has learned me thing that he did not kn w before—the mean ing of his sympt m—and yet h kn ws it as little as ever Thus we discove that th re is more than one kind of ignora ce It requires a considerable degree of in ght and understand ing of psych logical matters n rder to see in what the difference consists B t the proposi tion that symp ms vanish with th acqu tion of knowledge of their m aning remains true nevertheless Th necessary c ndition is that the knowledge must be f unded upon an inner change in the patient which can only c me about by a m ntal peration d rected to that end. W re here co f o ted b p oblem which to us will soo d elop into the *dyn m s f* sympt

have been compelled to disturb the peace of the world in yet another way as you will soon hear.

NINETEENTH LECTURE

RESISTANCE AND REPRESSION

WE now need more data before we can advance further in our understanding of the neuroses two observations lie to hand for us. Both are very remarkable and at first were very surprising. You are of course prepared for both of them by the work we did last year.

First when we undertake to cure a patient of his symptoms, he opposes against us a vigorous and tenacious *resistance* throughout the entire course of the treatment. This is such an extraordinary thing that we cannot expect much belief in it. It is best to say nothing about it to the patient's relations, for they invariably regard it as a pretext set up by us to excuse the length or the failure of the treatment. The patient too exhibits all the manifestations of this resistance without recognizing it as such, and it is a great step forward when we have brought him to realize this fact and to reckon with it. To think that the patient, whose symptoms cause him and those about him such suffering who is willing to make such sacrifices in time, money effort, and self-conquest in order to be freed from them—that he should, in the interests of his illness resist the help offered him. How improbable this statement must sound And yet it is so and if the improbability is made a reproach against us we need only reply that it is not without its analogies for a man who has rushed off to a dentist with frightful toothache may very well fend him off when he takes his forceps to the decayed tooth.

The resistance shown by patients is highly varied and exceedingly subtle often hard to recognize and protean in the manifold forms it takes the analyst needs to be continually suspicious and on his guard against In psycho-analytic therapy we employ the technique which is already familiar to you through dream-interpretation we require the patient to put himself in a condition of calm self observation, without trying to think of anything and then to communicate everything which he becomes inwardly aware of feelings, thoughts, remembrances in the order in which they arise in his mind. We expressly warn him against giving way to any kind of motive which would cause him to select from or to exclude any of the ideas (associations) whether because they are too "disagreeable" or too indiscreet to be mentioned or too "unimportant" or "irrelevant" or "nonsensical" to be worth saying We impress upon him that he has only to attend to what is on the surface consciously in his mind, and to abandon all objections to whatever he finds no matter what form they take and we inform him that the success of the treatment, and, above all its duration, will depend upon his conscientious adherence to this fundamental technical rule We know from the technique of dream interpretation that it is precisely those associations against which innumerable doubts and objections are raised that invariably contain the material leading to the discovery of the unconscious

The first thing that happens as a result of instituting this technical rule is that it becomes the first point of attack for the resistance The patient attempts to escape from it by every possible means First he says nothing comes into his head then that so much comes into his head that he can't grasp any of it. Then we observe with displeasure and astonishment that he is giving in to his critical objections, first to this, then to that he betrays it by the long pauses which occur in his talk. At last he admits that he really cannot say something he is ashamed to and he lets this feeling get the better of his promise Or else he has thought of something but it concerns someone else and not himself and is therefore to be made an exception to the rule Or else what he has just thought of is really too unimportant, too stupid and too absurd, I could never have meant that he should take account of such thoughts. So it goes on with untold variations to which one continually replies that telling everything really means telling every thing

One hardly ever meets with a patient who does not attempt to make a reservation in some department of his thoughts in order to guard them against intrusion by the analysis One patient who in the ordinary way was remarkably intelligent, concealed a most intimate love-affair from me for weeks in this way when accused of this violation of the sacred rule he defended himself with the argument that he considered this particular story his private affair Naturally analytic treatment cannot countenance a right of sanctuary like this one might as well try to allow an exception to be made in certain parts of a town like Vienna, and forbid that any arrests should be

case was there really an amnesia a lapse of memory but a connection which should have existed intact and have led to the reproduction the recollection of the memory had been broken This kind of disturbance of memory suffices for the obsessional neurosis in hysteria it is different This latter neurosis is usually characterized by amnesias on a grand scale As a rule the analysis of each single hysterical symptom leads to a whole chain of former impressions which upon their return may be literally described as having been hitherto forgotten This chain reaches on the one hand back to the earliest years of childhood so that the hysterical amnesia is seen to be a direct continuation of the infantile amnesia which hides the earliest impressions of our mental life from all of us On the other hand we are astonished to find that the most recent experiences of the patient are liable to be forgotten also and that in particular the provocations which induced the outbreak of the disease or aggravated it are at least partially obliterated if not entirely wiped out by amnesia From the complete picture of any such recent recollection important details have invariably disappeared or been replaced by falsifications It happens again and again almost invariably that not until shortly before the completion of an analysis do certain recollections of recent experiences come to the surface which had managed to be withheld throughout it and had left noticeable gaps in the context

These derangements in the capacity to recall memories are as I have said characteristic of hysteria in which disease it also happens even that states occur as symptoms (the hysterical attacks) without necessarily leaving a trace of recollection behind them Since it is otherwise in the obsessional neurosis you may infer that these amnesias are part of the psychological character of the hysterical change and are not a universal trait of neurosis in general The importance of this difference will be diminished by the following consideration Two things are combined to constitute the meaning of a symptom its *whence* and its *whither* or *why* that is the impressions and experiences from which it sprang and the purpose which it serves The *whence* of a symptom is resolved into impressions which have been received from without which were necessarily at one time conscious and which may have become unconscious by being forgotten since that time The *why* of the symptom its tendency is however always an endo psychic process which may possibly have been conscious at first but just as possibly may never have been conscious and may have remained in the unconscious from its inception Therefore it is not very important whether the amnesia has also infringed upon the *whence* the impressions upon which the symptom is supported as happens in hysteria the *whither* the tendency of the symptom which may have been unconscious from the beginning is what maintains the symptom s dependence upon the unconscious in the obsessional neurosis no less strictly than in hysteria

By thus emphasizing the unconscious in mental life we have called forth all the malevolence in humanity in opposition to psycho analysis Do not be astonished at this and do not suppose that this opposition relates to the obvious difficulty of conceivin the unconscious or to the relative inaccessibility of the evidence which supports its existence I believe it has a deeper source Humanity has in the course of time had to endure from the hands of science two great outrages upon its naive self love The first was when it realized that our earth was not the centre of the universe but only a tiny speck in a world system of a magnitude hardly conceivable this is associated in our minds with the name of Copernicus although Alexandrian doctrines taught somethin very similar The second was when biological research robbed man of his peculiar privilege of having been specially created and relegated him to a descent from the animal world implying an ineradicable animal nature in him this transvaluation has been accomplished in our own time upon the instigation of Charles Darwin Wallace and their predecessors and not without the most violent opposition from their contemporaries But man s craving for grandiosity is now suffering the third and most bitter blow from present day psycholo ical research which is endeavouring to prove to the *ego* of each one of us that he is not even master in his own house but that he must remain content with the veriest scraps of information about what is going on unconsciously in his own mind We psycho analysts were neither the first nor the only ones to propose to mankind that they should look inward but it appears to be our lot to advocate it most insistently and to support it by empirical evidence which touches every man closely This is the kernel of the universal revolt against our science of the total disregard of academic courtesy in dispute and the liberation of opposition from all the constraints of impartial logic And besides this we

assistance to the analysis if a skilful technique is employed correctly to turn them to the best use. What is noteworthy is that this material always serves at first as a resistance and comes forward in a guise which is inimical to the treatment. Again it may be said that they are character-traits, individual attitudes of the ego which are thus mobilized to oppose the attempted alterations. One learns then how these character-traits have been developed in connection with the conditions of the neurosis and in reaction against its demands, and observes features in this character which would not otherwise have appeared, at least, not so clearly, that which may be designated latent. Also you must not carry away the impression that we look upon the appearance of these resistances as an unforeseen danger threatening our analytic influence. No, we know that these resistances are bound to appear; we are dissatisfied only if we cannot rouse them definitely enough and make the patient perceive them as such. Indeed, we understand at last that the overcoming of these resistances is the essential work of the analysis, that part of the work which alone assures us that we have achieved something for the patient.

Besides this, you must take into account that all accidental occurrences arising during the treatment are made use of by the patient to interfere with it, anything which could distract him or deter him from it, every hostile expression of opinion from anyone in his circle whom he can regard as an authority, any chance organic illness or one complicating the neurosis; indeed, he even converts every improvement in his condition into a motive for slackening his efforts. Then you will have obtained an approximate though still incomplete picture of the forms and the measures taken by the resistances which must be met and overcome in the course of every analysis. I have given such a detailed consideration to this point because I am about to inform you that our dynamic conception of the neuroses is founded upon this experience of ours of the resistances the neurotic patients set up against the cure of their symptoms. Breuer and I both originally practised psycho-therapy by the hypnotic method; Breuer's first patient was treated throughout in a state of hypnotic suggestibility, and at first I followed his example. I admit that at that time my work went forward more easily and agreeably and also took much less time, but the results were capricious and not permanent; therefore I finally gave up hypnotism. And then I understood that no comprehension of the dynamics of these affections was possible as long as hypnosis was employed. In this condition the very existence of resistances is concealed from the physician's observation. Hypnosis drives back the resistances and frees a certain field for the work of the analysis, but dams them up at the boundaries of this field so that they are insurmountable; it is similar in effect to the doubt of the obsessional neurosis. Therefore I may say that true psycho-analysis only began when the help of hypnosis was discarded.

If it is a matter of such importance to establish these resistances then surely it would be wise to allow caution and doubt full play in case we have been too ready with our assumption that they exist. Perhaps cases of neurosis may be found in which the associations really fail for other reasons; perhaps the arguments against our theories really deserve serious attention, and we may be wrong in so conveniently disposing of the patient's intellectual objections by stigmatizing them as resistance. Well, I can only assure you that our judgment in this matter has not been formed hastily. We have had opportunity to observe these critical patients both before the resistance comes to the surface and after it disappears. In the course of the treatment the resistance varies in intensity continually; it always increases as a new topic is approached, it is at its height during the work upon it, and dies down again when this theme has been dealt with. Unless certain technical errors have been committed, we never have to meet the full measure of resistance of which any patient is capable at once. Thus we could definitely ascertain that the same man would take up and then abandon his critical objections over and over again in the course of the analysis. Whenever we are on the point of bringing to his consciousness some piece of unconscious material which is particularly painful to him, then he is critical in the extreme; even though he may have previously understood and accepted a great deal, yet now all these gains seem to be obliterated; in his struggles to oppose at all costs he can behave just as though he were mentally deficient, a form of 'emotional stupidity.' If he can be successfully helped to overcome this new resistance he regains his insight and comprehension. His critical faculty is not functioning independently, and therefore is not to be respected as if it were; it is merely a maid-of-all-work for his affective attitudes and is directed by his resistance. When he dis-

made in the market place or in th [illegible] in those afe places Once I decided to permit a man to make an exception of such a point for a great deal depended on his recovering his capacity for work and he was bound by his oath as a civil servant not to communicate certain matters to any other person He was content with the result it is true but I was not I made up my mind never again to repeat the attempt under such conditions

Obsessional patients are exceedingly clever at making the technical rule almost useless by bringing their over conscientiousness and doubt to bear upon it Patients with anxiety hysteria sometimes succeed in reducing it to absurdity by only producing associations which are so far removed from what is wanted that they yield nothing for analysis However I do not intend to introduce you to these technical difficulties of the treatment It is enough to know that finally with resolution and perseverance we do succeed in extracting from the patient a certain amount of obedience for the rules of the technique and then the resistance takes another line altogether It appears as intellectual opposition employs arguments as weapons and turns to its own use all the difficulties and improbabilities which normal but uninstructed reasoning finds in analytical doctrines We then have to hear from the mouth of the individual patient all the criticisms and objections which thunder about us in chorus in scientific literature What the critics outside shout at us is nothing new therefore It is indeed a storm in a teacup Still the patient can be argued with he is very glad to get us to instruct him teach him defeat him point out the literature to him so that he can learn more he is perfectly ready to become a supporter of psycho analysis on the condition that analysis shall spare him personally We recognize resistance in this desire for knowledge however it is a digression from the particular task in hand and we refuse to allow it In the obsessional neurosis the resistance makes use of special tactics which we are prepared for It permits the analysis to proceed uninterruptedly along its course so that more and more light is thrown upon the problems of the case until we begin to wonder at last why these explanations have no practical effect and entail no corresponding improvement in the symptoms Then we discover that the resistance has fallen back upon the doubt characteristic of the obsessional neurosis and is holding us successfully at bay from this vantage point. The patient has said to himself something of this kind This is all very pretty and very interesting I should like to go on with it I am sure it would do me a lot of good if it were true But I don t believe it in the least and as long as I don t believe it it doesn t affect my illness So it goes on for a long time until at last this reservation itself is reached and then the decisive battle begins

The intellectual resistances are not the worst one can always get the better of them But the patient knows how to set up resistances within the boundaries of analysis proper and the defeat of these is one of the most difficult tasks of the technique Instead of remembering certain of the feelings and states of mind of his previous life he reproduces them lives through again such of them as by means of what is called the *transference* may be made effective in opposition against the physician and the treatment If the patient is a man he usually takes this material from his relationship with his father in whose place he has now put the physician and in so doing he erects resistance out of his struggles to attain to personal independence and independence of judgment out of his ambition the earliest aim of which was to equal or to excel the father out of his disinclination to take the burden of gratitude upon himself for the second time in his life There are periods in which one feels that the patient s desire to put the analyst in the wrong to make him feel his impotence to triumph over him has completely ousted the worthier desire to bring the illness to an end Women have a genius for exploiting in the interests of resistance a tender erotically tinged transference to the analyst when this attraction reaches a certain intensity all interest in the actual situation of treatment fades away together with every obligation incurred upon undertaking it The inevitable jealousy and the embitterment consequent upon the unavoidable rejection however considerately it is handled is bound to injure the personal relationship with the physician and so to put out of action one of the most powerful propelling forces in the analysis

Resistances of this kind must not be narrowly condemned They contain so much of the most important material from the patient s past life and bring it back in so convincing a fashion that they come to be of the greatest

which is of course in th other room o to been w h the remain unconscious. When they have pressed f rward to the threshold and been turned back b the doo keeper they are *incap e of becoming conscious* we call them then *repres ed* But eve those excitations wh h are allowed o er the thres old do not necess ril become co sci us they can nly become o i they succeed in attracting the e e f consciousness. This seco d chamber there fore ma be suitably called *the preconscious sy em* In this way the p cess of becom ng con cious retains s purel descrip i e sense. Be g repressed, when applied to any s e impul e means being unab to pa s out f the uncon ci us system because of the doo keeper refusal of admitta ce into the precon cious The doo keeper is what we ha e learnt to know as res tanc in ou ttempts in anal tic treatment t loosen the repres sions

Now I know ery well that you will say that these conceptions are s crude as they are fa astic a d ot at all permissible in a scien ti presentation. I know they are crude furthe indeed, we even kn w that they are incorrect, and unles I am mistaken, we ha e someth g better ready as a subst t e for them wh ther you will then co tinue to think them so fanasti I do ot kn w At th m men they are useful aids t understandin like *Ampere s* manikin swimm g in the el ctric current, and, in so far as they do a sist com prehen on, are ot t be despised Still, I should like to assure you that these crude hypotheses, the two chambers, th doo keeper on t thresh d between the two and con sciousness as a pectat at the d f the second room must indicat an extensive ap proxima on to the *ctual* reality I h uld also like t hea you dmit that ur design tions, unco scious precon ci us and con ci us, are less prejud cial and more easily d fens bl than some thers which ha e been suggested or ha com into u g ub-con cious int -con scious co-consci us etc

If so I sh uld think t more significant f you the went on t point t that any such con itut on f th mental pparatus as I ha e assumed in rder to a count f neuroti symp toms can only be of universal alidity and must throw l ght on ormal functioning In t s f course you are perfectly right. We cannot f ll w up this co clusi n at the mo ment but ur interest in the psych logy f sym om-de elopment would certainly be enormousl increased if we could see any *prospect of obtai ng* by the s udy of patho l gical co d ion an in gh into normal mental funct oning h herto uch a mys ery

Do ou not recognize moreover what it is that upports these conceptions of the two s s ems a d the relat on hip between them a d co ci usness The door keeper between the uncon cious and the precon c ous is noth g else than the *cens rsh p* to which we found the *form of the man fes dream* ubjected. The res due of the day s experiences which we found to be the imul exc ting the dream was preconsc ous material which at ni ht d ring

h on cious and

y

which in normal mental life i e in the pr con scious system, is unknown or admi sible very rarely This difference in th ir manner of functio g is what disti guishes the two sys tems for us the relationship to consciousness wh h is permanent feature of the precon sci us indicates to which of the two systems an given process belongs Neither is dreaming a pathological phe omen every healthy pers n may dream whil asleep. E ery infer ence c c rning the con t tution of the mental apparatus which comprises an understanding of both dreams and n urotic ymptoms has an irrefut ble claim to be regarded as applying also t n rmal mental life

we w s bou t repres

it a

te

the

symptom is a s bstit te f some other process wh h was held back by repres n but even given repress on we ha e still a l ng way t go bef re we can obtain comprehen n of this substitute f rmati n. Ther are other s des t the probl m of repression tself which pre sent q estions t be answ red What kind of mental excit ti ns f r rep ess on What f rces effect t and *from what motives?* On one point nly s f ha e we gained any knowled e rel ant to these quest ns. While in estigating the pr blem f resistanc we learned that th f ces behi d t proceed from the ego from characte traits re ogni abl o lat t t is these f ces therefore wh ch ha e al o effected the repres ion, r t least they

likes anything he can defend himself against it most ingeniously but when anything suits his book he can be credulous enough We are perhaps all much the same a person being analysed shows this dependence of the intellect upon the affective life so clearly because in the analysis he is so hard pressed

In what way can we now account for this fact observed that the patient struggles so energetically against the relief of his symptoms and the restoration of his mental processes to normal functioning? We say that we have come upon the traces of powerful forces at work here opposing any change in the condition they must be the same forces that originally induced the condition In the formation of symptoms some process must have been gone through which our experience in dispersing them makes us able to reconstruct As we already know from Breuer s observations it follows from the existence of a symptom that some mental process has not been carried through to an end in a normal manner so that it could become conscious the symptom is a substitute for that which has not come through Now we know where to place the forces which we suspect to be at work A vehement effort must have been exercised to prevent the mental process in question from penetrating into consciousness and as a result it has remained unconscious being unconscious it had the power to construct a symptom The same vehement effort is again at work during analytic treatment opposing the attempt to bring the unconscious into consciousness This we perceive in the form of resistances The pathogenic process which is demonstrated by the resistances we call REPRESSION

It will now be necessary to make our conception of this process of *repression* more precise It is the essential preliminary condition for the development of symptoms but it is also something else a thing to which we have no parallel Let us take as a model an impulse a mental process seeking to convert itself into action we know that it can suffer rejection by virtue of what we call *repudiation* or *condemnation* whereupon the energy at its disposal is withdrawn it becomes powerless but it can continue to exist as a memory The whole process of decision on the point takes place with the full cognizance of the ego It is very different when we imagine the same impulse subject to *repression* it would then retain its energy and no memory of it would be left behind the process of repression too would be accomplished without the cognizance of the ego This comparison therefore brings us no nearer to the nature of repression

I will expound to you those theoretical conceptions which alone have proved useful in giving greater definiteness to the term *repression* For this purpose it is first necessary that we should proceed from the purely descriptive meaning of the word *unconscious* to its systematic meaning that is we resolve to think of the consciousness or unconsciousness of a mental process as merely one of its qualities and not necessarily definitive Suppose that a process of this kind has remained unconscious its being withheld from consciousness may be merely a sign of the fate it has undergone not necessarily the fate itself Let us suppose in order to gain a more concrete notion of this fate that every mental process—there is one exception which I will go into later—first exists in an unconscious state or phase and only develops out of this into a conscious phase much as a photograph is first a negative and then becomes a picture through the printing of the positive But not every negative is made into a positive and it is just as little necessary that every unconscious mental process should convert itself into a conscious one It may be best expressed as follows Each single process belongs in the first place to the unconscious psychical system from this system it can under certain conditions proceed further into the conscious system

The crudest conception of these systems is the one we shall find most convenient a spatial one The unconscious system may therefore be compared to a large ante room in which the various mental excitations are crowding upon one another like individual beings Adjoining this is a second smaller apartment a sort of reception room in which consciousness resides But on the threshold between the two there stands a personage with the office of door keeper who examines the various mental excitations censors them and denies them admittance to the reception room when he disapproves of them You will see at once that it does not make much difference whether the door keeper turns any one impulse back at the threshold or drives it out again once it has entered the reception room that is merely a matter of the degree of his vigilance and promptness in recognition Now this metaphor may be employed to widen our terminology The excitations in the unconscious in the ante chamber are not visible to consciousness

is not at all applicable in them the symptoms seem rather to contain the opposite purpose of excluding or of discontinuing sexual gratification. I shall not dispute your interpretation. In psycho-analysis things are often a good deal more complicated than we could wish; if they had been simpler psycho-analysis would perhaps not have been required to bring them to light. Certain features of the ritual of our second patient are distinctly recognizable as being of this ascetic character inimical to sexual satisfaction, e.g., her removing the clocks for the magic purpose of preventing erections at night, or her trying to prevent the falling and breaking of vessels which amounts to a protection of her virginity. In other cases of ceremonials on going to bed which I have analysed this negative character was far more marked; the whole ritual could consist of defensive regulations against sexual recollections and temptations. But we have long ago learnt from psycho-analysis that opposites do not constitute a contradiction. We might extend our proposition and say that the purpose of the symptom is either a sexual gratification or a defence against it; in hysteria the positive wish-fulfilling character predominate on the whole and in the obsessional neurosis the negative ascetic character. The symptoms can serve this purpose both of sexual gratification and of its opposite so well because this double-sidedness or *polarity* has a most suitable foundation in one element of their mechanism which we have not yet had an opportunity to mention. They are in fact, as we shall see, the effects of *compromises* between two opposed tendencies acting on one another; they represent both that which is repressed and also that which has effected the repression and has co-operated in bringing them about. The representation of either one or another of these two factors may predominate in the symptom but it happens very rarely that one of them is absent altogether. In hysteria a collaboration of the two tendencies in one symptom is usually achieved. In the obsessional neurosis the two parts are often distinct; the symptom is then a double one and consists of two successive actions which cancel each other.

It will not be so easy to dispose of a second difficulty. When you consider a whole series of symptom interpretations your first opinion would probably be that the conception of a sexual substitutive-gratification has to be stretched to its widest limits in order to include them. You will not neglect to point out that these symptoms offer nothing real in the way of gratification, that often enough they are confined to re-animating a sensation or to enacting a phantasy arising from some sexual complex. Further, that the ostensible sexual gratification is very often of an infantile and unworthy character, perhaps approximating to a masturbatory act, or is reminiscent of dirty habits which long ago in childhood had been forbidden and abandoned. And further still you will express your astonishment that anyone should reckon among sexual gratifications those which can only be described as gratifications of cruel or horrible appetites or which may be termed unnatural. Indeed we shall come to no agreement on these latter points until we have submitted human sexuality to a thorough investigation and have thus established what we are justified in calling sexual.

TWENTIETH LECTURE

The Sexual Life of Man

One would certainly think that there could be no doubt about what is to be understood by the term *sexual*. First and foremost, of course, it means the *improper*, that which must not be mentioned. I have been told a story about some pupils of a famous psychiatrist who once endeavoured to convince their master that the symptoms of an hysteric are frequently representations of sexual things. With this object, they took him to the bedside of an hysterical woman whose attacks were unmistakable imitations of childbirth. He objected, however: "Well, there is nothing sexual about childbirth." To be sure, childbirth is not necessarily always improper.

I perceive that you don't approve of my joking about such serious matters. It is not altogether a joke, however. Seriously, it is not so easy to define what the term *sexual* includes. Everything connected with the difference between the two sexes is perhaps the only way of hitting the mark, but you will find that too general and indefinite. If you take the sexual act itself as the central point, you will perhaps declare *sexual* to mean everything which is concerned with obtaining pleasurable gratification from the body (and particularly the sexual organs) of the opposite sex; in the narrowest sense everything which is directed to the union of the genital organs and the performance of the sexual act. In doing so, however, you come very near to reckoning the sexual and the improper as identical, and childbirth would really

have taken a part in it We know nothing more than this at present

The second observation for which I prepared you will help us now By means of analysis we can always discover the purpose behind the neurotic symptom This is of course nothing new to you I have already pointed it out in two cases of neurosis But to be sure what do two cases signify? You have a right to demand two hundred cases innumerable cases in demonstration of it But then I cannot comply with that So you must fall back on personal experience or upon belief which in this matter can rely upon the unanimou testimony of all psycho analysts

You will remember that in the two cases in which we submitted the symptoms to detailed investigation analysis led to the innermost secrets of the patient s sexual life In the first case moreover the purpose or tendency of the symptom under examination was particularly evident in the second case it was perhaps to some extent veiled by another factor to be mentioned later Well now what we found in these two examples we should find in every case we submitted to analysis Every time we should be led by analysis to the sexual experiences and desires of the patient and every time we should have to affirm that the symptom served the same purpose This purpose shows itself to be the gratification of sexual wishes the symptoms serve the purpose of sexual gratification for the patient they are a substitute for satisfactions which he does not obtain in reality

Think of the obsessive act of our first patient This woman has to do without the husband she loved so intensely on account of his deficiencies and short comings she could not share his life She had to be faithful to him she could not put anyone else in his place Her obsessional symptom gives her what she so much desires it exalts her husband denies and corrects his deficiencies above all his impotence This symptom is fundamentally a wish fulfilment in that respect exactly like a dream it is moreover what a dream is not always an erotic wish fulfilment In the case of the second patient you could see that her ritual aims at preventing intercourse between the parents or at hindering the procreation of another child you have probably also divined that fundamentally it seeks to set her in her mother s place It again therefore constitutes a removal of hindrances to sexual satisfaction and the fulfilment of the subject s own sexual wishes Of the complications referred to in th second case I shall speak shortly

I wish to avoid making reservations later on about the universal applicability of these statements and therefore I will ask you to notice that all I have just been saying about repression symptom formation and symptom interpretation has been obtained from the study of three types of neurosis and for the present is only applicable to these three types—namely *anxiety hysteria conversion hysteria* and *the obsessional neurosis* These three disorders which we are accustomed to combine together in a group as the TRANSFERENCE NEUROSES constitute the field open to psycho analytic therapy The other neuroses have been far less closely studied psycho analytically in one group of them the impossibility of therapeutic influence has no doubt been one reason for this neglect You must not forget that psycho analysis is still a very young science that much time and trouble are required for the study of it and that not o very long ago there was only one man practising it yet we are approaching from all directions to a nearer comprehension of these other conditions which are not transference neuroses I hope I shall still be able to tell you of the developments that our hypotheses and conclusions have undergone in the course of adaptation to this new material and to show you that the e further studies have not yielded contradictions but have led to a higher degree of unification in our knowledge Everything that has been said then applies only to the three transference neuroses and I will now add another piece of information which throws further light upon the significance of the symptoms A comparative examination of the situation out of which the disease arose yields the following re ult which may be reduced to a formula—namely that these persons have fallen ill from the privation (frustration) which they suffer when reality withholds from them gratification of their sexual wishes You will perceive how beautifully these two conclusions supplement one another The symptoms are now explicable as substitute gratifications for desires which are unsatisfied in life

It is certainly possible to make all kinds of objections to the proposition that neurotic symptoms are substitutes for sexual gratifications I will discuss two of them today If any one of you has himself undertaken the analysis of a large number of neurot cs he will perhaps shake his head and say In certain cases this

er in watching the other person's most intimate doings or those who expose parts of their own bodies which should be concealed in the vague expectation of being rewarded by a similar action on the part of the other. Then come the incomprehensible sadists in whom all affection and feeling strains towards the one goal of causing their object pain and torture, ranging in degree from mere indications of a tendency to humiliate the other up to the infliction of severe bodily injuries. Then although complementary to these come the masochists whose only longing is to suffer in real or in symbolic form, humiliations and tortures at the hands of the loved object. There are others yet in whom [illegible] f th[illegible] kind [illegible]

each of these groups may be [illegible] those who seek their particular form of sexual satisfaction in reality and those who are satisfied merely to imagine it in their own minds needing no real object at all but being able to substitute for it a creation of phantasy.

There is not the slightest possible doubt that these mad, extraordinary and horrible things do actually constitute the sexual activities of these people. Not merely do they themselves so regard them, recognizing their substitutive character, but we also have to acknowledge that they play the same part in their lives as normal sexual satisfaction plays in ours; exact[illegible] the same, often extensive sacrifices. It is possible to trace out, both broadly and in great detail, where these abnormalities merge into the normal and where they diverge from it. Nor will it escape you that that quality of impropriety which adheres inevitably to a sexual activity is not absent from these forms of it; in most of them it is intensified to the point of odium.

Well, now what attitude are we to take up to these unusual forms of sexual satisfaction? Indignation and expressions of our personal disgust, together with assurances that we do not share these appetites, will obviously not carry us very far. That is not the point at issue. After all, this is a field of phenomena like any other. Attempts to turn away and flee from it on the pretext that these are but rarities and curiosities, could easily be rebutted. On the contrary the phenomena are common enough and widely distributed. But if it is objected that our views on the sexual life of mankind require no revision on this [illegible]unt, since these things are one and all aberrations and divagations of the sexual instinct, a serious reply will be necessary. If we do not understand these morbid forms of sexuality and cannot relate them to what is normal in sexual life, then neither can we understand normal sexuality. It remains, in short, our undeniable duty to account satisfactorily in theory for the existence of all the perversions described and to explain their relation to normal sexuality so-called.

In this task we can be helped by a point of view and by two new evidential observations. The first we owe to Iwan Bloch, according to him, the view that all the perversions are "signs of degeneration" is incorrect, because of the evidence existing that such aberrations from the sexual aim, such erratic relationships to the sexual object, have been manifested since the beginning of time through every age of which we have knowledge, in every race from the most primitive to the most highly civilized, and at times have succeeded in attaining to toleration and general prevalence. The two evidential observations have been made in the course of psycho-analytic investigations of neurotic patients; they must undoubtedly influence our conception of sexual perversions in a decisive manner.

We have said that neurotic symptoms are substitutes for sexual satisfactions, and I have already indicated that many difficulties will be met with in proving this statement from the analysis of symptoms. It is indeed only accurate if the *perverse* sexual needs so-called, *are included under sexual satisfactions*, for an interpretation of the symptoms on this basis is forced upon us with astonishing frequency. The claim made by homosexuals or inverts that they constitute a select class of mankind, falls at once to the ground when we discover that *in every single neurotic*, evidence of homosexual tendencies is forthcoming and that a large proportion of the symptoms are expressions of this latent inversion. Those who openly call themselves homosexuals are merely those in whom the inversion is conscious and manifest; their number is negligible compared with those in whom it is latent. We are bound in fact to regard the choice of an object of the same sex as a regular type of offshoot of the capacity to love, and are learning every day more and more to recognize it as especially important. The differences between manifest homosexuality and the normal attitude are certainly not thereby obviated; they have their practical importance which remains, but theoretically their value is very considerably dimin

have nothing to do with sex If then you make the function of reproduction the kernel of sexuality you run the risk of excluding from it a whole host of things like masturbation or even kissing which are not directed towards reproduction but which are nevertheless undoubtedly sexual However we have already found that attempts at definition always lead to difficulties let us give up trying to do any better in this particular case We may suspect that in the development of the concept *sexual* something has happened which has resulted in what H Silberer has aptly called a *covering error* On the whole indeed we know pretty well what is meant by sexual

In the popular view which is sufficient for all practical purposes in ordinary life sexual is something which combines references to the difference between the sexes to pleasurable excitement and gratification to the reproductive function and to the idea of impropriety and the necessity for concealment But this is no longer sufficient for science For painstaking researches (only possible of course in a spirit of self command maintained by self sacrifice) have revealed that classes of human beings exist whose sexual life deviates from the usual one in the most striking manner One group among these *perverts* has as it were expunged the difference between the sexes from its scheme of life In these people only the same sex as their own can rouse sexual desire the other sex (especially the genital organ of the other sex) has absolutely no sexual attraction for them can even in extreme cases be an object of abhorrence to them They have thus of course foregone all participation in the process of reproduction Such persons are called *homosexuals* or *inverts* Often though not always they are men and women who otherwise have reached an irreproachably high standard of mental growth and development intellectually and ethically and are only afflicted with this one fateful peculiarity Through the mouths of their scientific spokesmen they lay claim to be a special variety of the human race a *third sex* as they call it standing with equal rights alongside the other two We may perhaps have an opportunity of critically examining these claims They are not of course as they would gladly maintain the *elect* of mankind they contain in their ranks at least as many inferior and worthless individuals as are to be found among those differently constituted sexually

These perverts do at least seek to achieve very much the same ends with the objects of their desires as normal people do with theirs But after them comes a long series of abnormal types in whom the sexual activities become increasingly further removed from anything which appears attractive to a reasonable being In their manifold variety and their strangeness these types may be compared to the grotesque monstrosities painted by P Breughel to represent the temptation of St Anthony or to the long procession of effete gods and worshippers which G Flaubert shows us passing before his pious penitent and to nothing else The chaotic assembly calls out for classification if it is not to bewilder us completely We divide them into those in whom the *sexual object* has been altered as with the homosexuals and those in whom first and foremost the *sexual aim* has been altered In the first group belong those who have dispensed with the mutual union of the genital organs and who have substituted for the genitals in one of the partners in the act another organ or part of the body (mouth or anus in place of the vagina) making light of both the anatomical difficulties and the suppression of disgust involved There follow others who it is true still retain the genital organs as object not however by virtue of their sexual function but on account of other functions in which they take part anatomically or by reason of their proximity These people demonstrate that the excretory functions which in the course of the child s upbringing are relegated to a limbo as indecent remain capable of attracting the entire sexual interest There are others who have given up altogether the genital organs as object and instead have exalted some other part of the body to serve as the object of desire a woman s breast foot or plait of hair There are others yet to whom even a part of the body is meaningless while a particle of clothing a shoe or a piece of under clothing will gratify all their desires these are the fetichists Farther on in the scale come those who indeed demand the object as a whole but whose requirements in regard to it take specific forms of an extraordinary or horrible nature—even to the point of seeking it as a defenceless corpse and urged on by their criminal obsessions of making it one in order so to enjoy it But enough of these horrors!

Foremost in the second group are those perverts whose sexual desires aim at the performance of an act which normally is but an introductory or preparatory one They are those who seek gratification in looking and touching

er in watching the other person s most intimate doings or those who expose parts of their own bodies which should be concealed in the vague expectation of bein rewarded by a similar action on the part of the other Then come the incomprehensib e sadists, in wh m all affection a feeling strains towards the one goal of causing their object pain and t rture ranging in degree from mere ind cations of a tendency to humiliate the other up t the infliction of severe bodily injuries Then as though complementary to these come th masochists whose only longing is to suffer in real or in symbolic form, humiliations and tortures at the hands of the loved object. There are others yet in whom s [illegible] f th s kind

[illegible]

each of these groups may be [illegible] against those who seek th particular form of sexual satisfaction in reality and those who are satisfied merely to imagine it in their own minds, eeding no real object at all but being able t substitute fo it a creation of phantasy

There is n t the lightest pos ible doubt that these mad extraordinary and h rrible things do actually constitute the sexual activities of these people Not merely do they themselves so regard them, recognizing their substitutive character but we als ha e t acknowledge that they play the same part in their lives as normal exual satisfaction plays in ours, exacting the same ften excessi e sacrifices It is possibl to trace ut both broadly and in great detail, where th e abn rmalities merge into the normal and where they diverge from t. Nor will t escape y u that that quality of impropriety which adheres inevitably to a sexual activity is not bse t from these forms of t in most f them it is intensified t the point of odium.

W ll now what attit de e w to take up t these unusual forms f sexual sati faction? Indignati and expressions of our perso al disgust, together with ass rances that we d ot share these appetit s will by o ly not carry us very far That is t the point at ue After all, this is a fi ld of ph mena lik a y othe ttempts t t rn away and flee f m it the pretext that th se are b t rarities and curi ties, co ld eas ly be rebutt d On the c trary the ph mena are c mmon e gh and w d ly distributed. But if t bjected th t our views on the sexual life of mank nd requi o revi sion o this account [illegible] th things are one and all berratio s and d vagat s of the sexual instinct a serious reply will be necessary If we do not understand these morbid forms of sexuality and cannot relate them to wha is normal in sexual life then neither can we understand normal sexuality It remains in short our undeniable d t to account sa s factorily in theory for the existence of all the perversions described and to explain their relation to normal sexuality so-called.

In this task we can be helped by a point of view and by two new evidential observations. The first we owe to I an Bloch according to him, the view that all the perversions are "signs of degeneration is incorrect because of the evidence existing that such aberrations from the sexual aim such errat c relationships to the sexual object, have been manifested since the beginning of time through every age of which we have knowledge in every race from the most primitive to the most highly civilized, and at times ha e succeeded in attaining to tolera tion and general prevalence. The two evidential observati s ha e been made in the course of psycho-analytic investigations of neurot c patients they must undoubtedl influence our conception of sexual perversio s in a deci ve manner

We have said that neurotic symptoms are substitutes for exual satisfactions and I ha e already indicated that many difficulties will be met with in proving this statement from the analysis of symptoms. It is indeed only accurate if the *perverse* sexual needs so-called, are included under sexual satisfactions f r an interpretation of the sympt ms on this basis is forced upon us with as onishing frequency The claim mad by homosexuals or inverts, that they constitute a select class of mankind, falls at o ce to the ground when we discover that, in every single neurotic evidence of homosexual tendencies is forthcoming and that a large proportion of the symptoms are ex pressions of this late t inversion. Those who openly call themsel es homosexual are merely [illegible]

the same sex as a regula type of offshoot of the capacity to lo e and are learning ery day more and m re to recognize it as especially important The differences between manifest homosexuality d the n rmal attitude re certainly not ther by abrogated they ha e their practical importance which remains but theoretically the r val e ery consid rably dimin

ished In fact we have even come to the con clusion that one particular mental disorder paranoia no longer to be reckoned among the transference neuroses nvariably arises from an attempt to subdue unduly powerful homo sexual tendencies Perhaps you will remember that one of our patients in her obsessive act played the part of a man—of her own husband that is whom she had left such symptoms representing the impersonation of a man are very commonly produced by neurotic women If this is not actually attributable to homo sexuality it is certainly very closely connected with its origins

As you probably know the neurosis of hys teria can create its symptoms in all systems of the body (circulatory respiratory etc) and may thus disturb all the functions Analysis shows that all those impulses described as *perverse* which aim at replacing the genital organ by another come to expression in these symptoms These organs thus behave as sub stitutes for the genital organs it is precisely from the study of hysterical symptoms that we have arrived at the view that besides their functional role a sexual—*erotogenic*—signifi cance must be ascribed to the bodily organs and that the needs of the former will be inter fered with if the demands of the latter upon them are too great Countless sensations and innervations which we meet as hysterical symp toms in organs apparently not concerned with exuality are thus discovered to be essentially fulfilments of perverse sexual de ires by the other organs having usurped the function of the genitalia In this way also the very great extent to which the organs of nutrition and of excretion in particular may serve in yielding sexual excitement is brought home to us It is indeed the ame as is manifested in the per versions except that in the latter it is unmis takable and recognizable without any difficulty whereas in hysteria we have to make the de tour of interpreting the symptom and then do not impute the perverse sexual impulse in question to the person s consciousness but account it to the unconscious part of his personality

Of the many types of symptoms characteristic of the obsessional neurosis the most important are found to be brought about by the undue strength of one group of sexual tendencies with a perverted aim i e the sadistic group These symptoms in accordance with the structure of the obsessional neurosis serve mainly as a de fence against the e wi hes or else they express the conflict between satisfaction and rejection Satisfaction does not find short hrift how ever it knows how to get its own way by a roundabout route in the patient s behaviour by preference turning against him in self inflicted torment Other forms of this neurosis are seen in excessive *worry* and brooding these are the expressions of an exaggerated sexualiza tion of acts which are normally only prepar atory to sexual satisfaction the desire to see to touch and to investigate In this lies the ex planation of the very great importance dread of contact and obsessive washing attains to in this disease An unsuspectedly large proportion of obsessive actions are found to be disguised repetitions and modifications of masturbation admittedly the only uniform act which accom panies all the varied flights of sexual phantasy

It would not be difficult to show you the connections between perver ion and neurosis in a much more detailed manner but I believe that I have said enou h for our purposes. We must beware however of overestimating the frequency and intensity of the perverse tend encies in mankind after these revelations of their importance in the interpretation of symp-toms You have heard that frustration of nor mal sexual satisfactions may lead to the devel opment of neurosis In consequence of this frustration in reality the need is forced into the abnormal paths of sexual excitation Later you will be able to understand how this hap-pens You will at any rate understand that a *collateral* damming up of this kind must swell the force of the perverse impul es so that they become more powerful than they would have been had no hindrance to normal sexual satis faction been present in reality Incidentally a similar factor may be recognized also in the manifest perversions In many ca es they are provoked or activated by the unduly great difficulties in the way of normal satisfaction of the exual instinct which are produced either by temporary conditions or by permanent o-cial institutions In other cases certainly per verse tendencies are quite independent of uch conditions they are as it were the natural kind of sexual life for the individual concerned

Perhaps you are momentarily under the im pression that all this tends to confuse rather than to explain the relations between normal and perverted sexuality But keep in mind this consideration If it is correct that real obstacles to sexual satisfaction or fru tration in regard to it bring to the surface perverse tendencies

[1] See p 553

in people who would otherwise have shown none we must conclude that something in these people is ready to embrace the perversions, or, *if you prefer it*, the tendencies must have been present in them in a latent form. Thus we come to the second of the new evidential ob-

invariably lead back to the earliest years of childhood. That which we discovered *in this* way has since been corroborated point by point by the direct observation of children. In this way it has been found that all the perverse tendencies have their roots in childhood, that children are disposed towards them all and practise them all to a degree conforming with their immaturity; in short, *perverted sexuality* is nothing else but infantile sexuality magnified and separated into its component parts.

Now you will see the perversions in an altogether different light and no longer ignore *their connection with the sexual life of man*kind; but what distressing emotions these astounding and grotesque revelations will provoke in you! At first you will certainly be tempted to deny everything—the fact that there is anything in children which can be termed sexual life, the accuracy of our observations and the justification of our claim to see in the behaviour of children any connection with that which in later years is condemned as perverted. Permit me first to explain to you the motives of your antagonism and then to put before you a summary of our observations. That children should have no sexual life—sexual excitement, needs and gratification of a sort—but that they suddenly acquire these things in the years between twelve and fourteen would be, apart from any observations, just as improbable, indeed nonsensical, as to suppose that they were born without genital organs which first begin to sprout at the age of puberty. What does actually awaken in them at this period is the reproductive function, which makes use for its own purposes of material lying to hand in body and mind. You are making the mistake of confounding sexuality and reproduction with each other and thus you obstruct your own way to the comprehension of sexuality, the perversions and the neuroses. This mistake, moreover, has a meaning. Strange to say, its origin lies in the fact that you yourselves have all been children and as children were subject to the influence of education. For it is indeed one of the most important social tasks of education to restrain, confine and subject to an individual control (itself identical with the demands of society) the sexual instinct when it breaks forth in the form of the reproductive *function*. *In its own interests*, accordingly, society would postpone the child's full development until it has attained a certain stage of intellectual maturity, since educability practically ceases with the full onset of the sexual *instinct*. Without this the instinct would break all bounds and the laboriously erected structure of civilization would be swept away. Nor is the task of restraining it ever an easy one; success in this direction is often poor and sometimes only too great. At bottom society's motive is economic; since it has not means *enough to support life for its members without* work on their part, it must see to it that the number of these members is restricted and their energies directed away from sexual activities on to their work—the eternal primordial *struggle for existence, therefore*, persisting to the present day.

Experience must have taught educators that the task of moulding the sexual will of the next generation can only be carried out by beginning to impose their influence very early, and intervening in the sexual life of children *before puberty*, instead of waiting till the storm bursts. Consequently almost all infantile sexual activities are forbidden or made disagreeable to the child; the ideal has been to make the child's life asexual, and in course of time it has come to this that *it is really believed to be* asexual and is given out as such even at the hands of science. In order, then, to avoid any contradiction with established beliefs and aims, the sexual activity of children is overlooked—no small achievement by the way—while science contents itself with otherwise explaining it away. The little *child* is supposed to be pure and innocent; he who says otherwise shall be condemned as a hardened blasphemer against humanity's tenderest and most sacred feelings.

The children alone take no part in this convention; they assert their animal nature naïvely enough and demonstrate persistently that they have yet to learn *their purity*. Strange to say, those who deny sexuality in children are the last to relax educative measures against it; they follow up with the greatest severity every manifestation of the *childish tricks*, the existence of which they deny. Moreover, it is theo-

retically of great interest that the time of life which most flagrantly contradicts the prejudice about asexual childhood the years of infancy up to five or six is precisely the period which is veiled by oblivion in most people s memories an oblivion which can only be dispelled completely by analysis but which even before this was sufficiently penetrable to allow some of the dreams of childhood to be retained

I will now tell you the most clearly recognizable of the child s sexual activities It will be expedient if I first introduce you to the term libido In every way analogous to *hunger* libido is the force by means of which the instinct in this case the sexual instinct as with hunger the nutritional instinct achieves expression Other terms such as *sexual excitation* and *satisfaction* require no definition Interpretation finds most to do in regard to the sexual activities of the infant as you will easily perceive and no doubt you will find a reason for objections This interpretation is formed on the basis of analytic investigation working backwards from a given symptom The infant s first sexual excitations appear in connection with the other functions important for life Its chief interest as you know is concerned with taking nourishment as it sinks asleep at the breast utterly satisfied it bears a look of perfect content which will come back again later in life after the experience of the exual orgasm This would not be enough to found a conclusion upon However we perceive that infants wish to repeat without really getting any nourishment the action necessary to taking nourishment they are therefore not impelled to this by hunger We call this action *pleasure sucking* (German *lutschen* signifying the enjoyment of sucking for its own sake—as with a rubber comforter) and as when it does this the infant again falls asleep with a blissful expression we see that the action of sucking is sufficient in itself to give it satisfaction Admittedly it very soon contrives not to go to leep without having sucked in this way An old physician for children in Budapest Dr Lindner was the first to maintain the sexual nature of this procedure Nurses and people who look after children appear to take the same view of this pleasure sucking though without taking up any theoretic attitude about it They have no doubt that its only purpose is in the pleasure derived they account it one of the child s *naughty tricks* and take severe measures to force it to give it up if it will not do so of its own accord And so we learn that an infant performs actions with no other object but that of obtaining pleasure We believe that this pleasure is first of all experienced while nourishment is being taken but that the infant learns rapidly to enjoy it apart from this condition The gratification obtained can only relate to the region of the mouth and lips we therefore call these areas of the body *erotogenic zones* and describe the pleasure derived from this sucking as a *sexual* one To be sure we have yet to discuss the justification for the use of this term

If the infant could express itself it would undoubtedly acknowledge that the act of sucking at its mother s breast is far and away the most important thing in life It would not be wrong in this for by this act it gratifies at the same moment the two greatest needs in life Then we learn from psycho analysis not without astonishment how much of the mental significance of this act is retained throu hout life Sucking for nourishment becomes the point of departure from which the whole sexual life develops the unattainable prototype of every later sexual satisfaction to which in times of need phantasy often enough reverts The desire to suck includes within it the desire for the mother s breast which is therefore the first *object* of sexual desire I cannot convey to you any adequate idea of the importance of this first object in determining every later object adopted of the profound influence it exerts through transformation and substitution upon the most distant fields of mental life First of all however as the infant takes to sucking for pleasure this object is given up and is replaced by a part of its own body it sucks its thumb or its own tongue For purposes of obtaining pleasure it thus makes itself independent of the concurrence of the outer world and in addition it extends the region of excitation to a second area of the body thus intensifying it The erotogenic zones are not all equally capable of yielding enjoyment it is therefore an important experience when as Dr Lindner says the infant in feeling about on its own body discovers the particularly excitable region of its genitalia and so finds the way from pleasure sucking to onanism

This assessment of the nature of pleasure sucking has now brought to our notice two of the decisive characteristics of infantile sexuality It appears in connection with the satisfaction of the great organic needs and it behaves *auto erotically* that is to say it seeks and finds its objects in its own person What is

most clearly discernible in regard to the taking of nourishment is to some extent repeated with the process of excretion. We conclude that infants experience pleasure in the evacuation of urine and the contents of the bowel, and that they very soon endeavour to contrive these actions so that the accompanying excitation of the membranes in these erotogenic zones may secure them the maximum possible gratification. As Lou Andreas has pointed out, with fine intuition, the outer world first steps in as a hindrance at this point, a hostile force opposed to the child's desire for pleasure—the first hint he receives of external and internal conflicts to be experienced later on. He is not to pass his excretions whenever he likes but at times appointed by other people. To induce him to give up these sources of pleasure he is told that everything connected with these functions is *indecent* and must be kept concealed. In this way he is first required to exchange pleasure for value in the eyes of others. His own attitude to the excretions is at the outset very different. His own faeces produce no disgust in him; he values them as part of his own body and is unwilling to part with them; he uses them as the first present by which he can mark out those people whom he values especially. Even after education has succeeded in alienating him from these tendencies he continues to feel the same high regard for his presents and his money, while his achievements in the way of urination appear to be the subject of particular pride.

I know that for some time you have been longing to interrupt me with cries of "Enough of these monstrosities! The motions of the bowels a source of pleasurable sexual satisfaction exploited even by infants! Faeces a substance of great value, and the anus a kind of genital organ! We do not believe it; but we understand why children's physicians and educationists have emphatically rejected psycho-analysis and its conclusions." Not at all; you have merely forgotten for the moment that I have been endeavouring to show you the connection between the actual facts of infantile sexual life and the actual facts of the sexual perversions. Why should you not know that in many adults both homosexual and heterosexual, the anus actually takes over the part played by the vagina in sexual intercourse? And that there are many persons who retain the pleasurable sensations accompanying evacuations of the bowels throughout life and describe them as far from insignificant? You may hear from children themselves, when they are a little older and able to talk about these things, what an interest they take in the act of defaecation and what pleasure they find in watching others in the act. Of course if you have previously systematically intimidated these children they will understand very well that they are not to speak of such things. And for all else that you refuse to believe I refer you to the evidence brought out in analysis and to the direct observation of children and I tell you that it will require the exercise of considerable ingenuity to avoid seeing all this or to see it in a different light. Nor am I at all averse from your thinking the relationship between childish sexual activities and the sexual perversions positively striking. It is a matter of course that there should be this relationship, for if a child has a sexual life at all it must be of a perverted order, since apart from a few obscure indications he is lacking in all that transforms sexuality into the reproductive function. Moreover it is a characteristic common to all the perversions that in them reproduction as an aim is put aside. This is actually the criterion by which we judge whether a sexual activity is perverse—if it departs from reproduction in its aims and pursues the attainment of gratification independently. You will understand therefore that the gulf and turning-point in the development of the sexual life lies at the point of its subordination to the purposes of reproduction. Everything that occurs before this conversion takes place, and everything which refuses to conform to it and serves the pursuit of gratification alone, is called by the unhonoured title of *perversion* and as such is despised.

So let me continue my brief account of infantile sexuality. I could supplement what I have to do you concerning two of the bodily systems by extending the same scrutiny to the others. The sexual life of the child consists entirely in the activities of a series of component instincts which seek for gratification independently of one another, some in his own body and others already in an external object. Among the organs of these bodily systems the genitals rapidly take the first place; there are people in whom pleasurable gratification in their own genital organ, without the aid of another genital organ or object, is continued without interruption from the onanism habitual in the sucking period of infancy to the onanism of necessity occurring in the years of puberty, and then maintained indefinitely be-

yond that Incidentally the subject of onanism is not so easily exhausted it contains material for consideration from various angles

In spite of my wish to limit the extent of this discussion I must still say something about sexual curiosity in children It is too characteristic of childish sexuality and too important for the symptom formation of the neuroses to be omitted Infantile sexual curiosity begins very early sometimes before the third year It is not connected with the difference between the sexes which is nothing to children since they—boys at least—ascribe the same male genital organ to both sexes If then a boy discovers the vagina in a little sister or playmate he at once tries to deny the evidence of his senses for he cannot conceive of a human being like himself without his most important attribute Later he is horrified at the possibilities it reveals to him the influence of previous threats occasioned by too great a preoccupation with his own little member now begins to be felt He comes under the dominion of the castration complex which will play such a large part in the formation of his character if he remains healthy and of his neurosis if he falls ill and of his resistances if he comes under analytic treatment Of little girls we know that they feel themselves heavily handicapped by the absence of a large visible penis and envy the boy s possession of it from this source primarily springs the wish to be a man which is resumed again later in the neurosis owing to some mal adjustment to a female development The clitoris in the girl moreover is in every way equivalent during childhood to the penis it is a region of especial excitability in which auto erotic satisfaction is achieved In the transition to womanhood very much depends upon the early and complete relegation of this sensitivity from the clitoris over to the vaginal orifice In those women who are sexually anaesthetic as it is called the clitoris has stubbornly retained this sensitivity

The sexual interest of children is primarily directed to the problem of birth— [illegible] [illegible] a [illegible] of the arrival of another child The answer which the nursery has ready for the child that the stork brings the babies meets with incredulity even in little children much more often than we imagine The feeling of having been deceived by grown up people and put off with lies contributes greatly to a sense of isolation and to the development of independence But the child is not able to solve this problem on his own account His undeveloped sexual constitution sets definite limits to his capacity to understand it. He first supposes that children are made by mixing some special thing with the food taken nor does he *know that only women can have* children Later he learns of this limitation and gives up the idea of children being made by food though it is retained in fairy tales A little later he soon sees that the father must have something to do with making babies but he cannot discover what it is If by chance he is witness of the sexual act he conceives it as an attempt to overpower the woman as a combat the sadistic misconception of coitus at first however he does not connect this act with the creation of children if he discovers blood on the mother s bed or under linen he takes it as evidence of injury inflicted by the father In still later years of childhood he probably guesses that the male organ of the man plays an essential part in the procreation of children but cannot ascribe to this part of the body any function but that of urination

Children are all united from the outset in the belief that the birth of a child takes place by the bowel that is to say that the baby is produced like a piece of fæces Not until all interest has been weaned from the anal region is this theory abandoned and replaced by the supposition that the navel opens or that the area between the two nipples is the birthplace of the child In some such manner as this the enquiring child approaches some knowledge of the facts of sex unless misled by his ignorance he overlooks them until he receives an imperfect and discrediting account of them usually in the period before puberty which not infrequently affects him traumatically

Now you will probably have heard that the term *sexual* has suffered an unwarrantable expansion of meaning at the hands of psycho-analysis in order that its assertions regarding the sexual origin of the neuroses and the sexual significance of the symptoms may be maintained You can now judge for yourselves *whether this amplification is justified or not* We have extended the meaning of the concept *sexuality* only so far as to include the sexual life of perverted persons and also of children that is to say we have restored to it its true breadth of meaning What is called *sexuality* outside psycho analysis applies only to the restricted sexual life that is subordinated to the reproductive function and is called *normal*

TWENTY FIRST LECTURE

DEVELOPMENT OF THE LIBIDO AND SEXUAL ORGANIZATIONS

It is my impression that I have not succeeded in bringing home to you with complete conviction the importance of the perversions for our conception of sexuality. I wish therefore as far as I am able to review and improve upon what I have already said on this subject.

Now I do not wish you to think that it was the perversions alone that required us to make the alteration in the meaning of the term sexuality which has aroused such vehement opposition. The study of infantile sexuality has contributed even more to it, and the unanimity between the two was decisive. But, however unmistakably they may be in the later years of childhood, the manifestations of infantile sexuality in its earliest forms do seem to fade away indefinitely. Those who do not wish to pay attention to evolution and to the connections brought out by analysis will dispute the sexual nature of them, and will ascribe in consequence some other undifferentiated character to them. You must not forget that as yet we have no generally acknowledged criterion of the sexual nature of a phenomenon unless it is some connection with the reproductive function—a definition which we have had to reject as too narrow. The biological criteria, such as the periodicities of twenty-three and twenty-eight days, suggested by W. Fliess, are exceedingly debatable; the peculiar chemical features which we may perhaps assume for sexual purposes are yet to be discovered. The sexual perversions in adults, on the other hand, are something definite and unambiguous. As their generally accepted description implies, they are unquestionably of sexual nature, whether you call them marks of degeneration or anything else, no one has yet been so bold as to rank them anywhere but among the phenomena of sexual life. In view of them alone we are justified in maintaining that sexuality and the reproductive function are not identical, for they one and all abjure the aim of reproduction.

I notice a not uninteresting parallel here. Whereas for most people the word *mental* means *conscious* we found ourselves obliged to widen the application of the term *mental* to include part of the mind that is not conscious. In a precisely similar way most people declare *sexual* identical with *pertaining to reproduction*—or if you like to expressed more concisely with *genital*, whereas we cannot avoid admitting things as sexual that are not genital and have nothing to do with reproduction. It is only a formal analogy, but it is not without deeper significance.

However, if the existence of sexual perversions is such a *forcible argument* on this point, why has it not long ago done its work and settled the question? I really am unable to say. It seems to me that the sexual perversions have come under a very special ban, which insinuates itself into the theory and interferes even with scientific judgment on the subject. It seems as if no one could forget not merely that they are detestable but that they are also something monstrous and terrifying, as if they exerted a seductive influence, as if at bottom a secret envy of those who enjoy them had to be strangled—the same sort of feeling that is confessed by the count who sits in judgment in the famous parody of *Tannhäuser*:

> *So in the Mount of Venus conscience and duty are forgot!*
> *—Remarkable that such things has never been my lot!*

In reality, perverts are more likely to be poor devils who have to pay most bitterly for the satisfaction they manage to procure with such difficulty.

That which makes perverse activities so unmistakably sexual, in spite of all that seems unnatural in their objects or their aims, is the fact that in perverse satisfaction the act will terminate usually in a complete orgasm with evacuation of the genital product. This is of

tions to them which are again not recognized definitely as sexual.

I must still add something more in order to complete our assessment of the sexual perversions. Abominated as they are, sharply distinguished from normal sexual activity as they may be, simple observation will show that very rarely one feature or another of them is absent from the sexual life of a normal person. The kiss, to begin with, has some claim to be called a perverse act, for it consists of the union of the two erotogenic mouth zones instead of the two genital organs. But no one condemns it as perverse; on the contrary, in the theatre it is permitted as a refined indication of the sexual act. Nevertheless kissing is a thing that can

easily become an absolute perversion—namely when it occurs in such intensity that orgasm and emission directly accompany it which hap pens not at all uncommonly Further it will be found that gazing at and handling the object are in one person an indispensable condition of sexual enjoyment while another at the height of sexual excitement pinches or bites that in another lover not always the genital region but some other bodily re ion in the object pro vokes the greatest excitement and so on in end less variety It would be absurd to exclude peo ple with single idiosyncrasies of this kind from the ranks of the normal and place them among perverts rather it becomes more and more clear that what is essential to the perversions lies not in the overstepping of the sexual aim not in the replacement of the genitalia not al ways even in the variations in the object but solely in the *exclusiveness* with which these de viations are maintained so that the sexual act which serves the reproductive process is re jected altogether In so far as perverse per formances are included in order to intensify or to lead up to the performance of the normal sexual act they are no lon er actually perverse Facts of the kind just described naturally tend to diminish the gulf between normal and per verse sexuality very considerably The obvious inference is that normal sexuality has arisen out of something existing prior to it by a proc ess of discarding some components of this ma terial as useless and by combining the others so as to subordinate them to a new aim that of reproduction

The point of view thus gained in [illegible] o th [illegible]

[illegible] must draw your attention to an important difference between the two Perverse sexuality is as a rule exceedingly con centrated its whole activity is directed to one —and mostly to only one—aim one particular component impulse is supreme it is either the only one discernible or it has subjected th others to its own purposes In this respect there is no difference between perverse and normal sexuality except that the dominating compo nent impulse and therefore the sexual aim is a different one Both of them constitute a well organized tyranny only that in one case one ruling family has usurped all the power and in the other another This concentration and or ganization on the other hand is in the main absent from infantile sexuality its component impulses are equally valid each of them strives independently after its own pleasure Both the lack of this concentration (in childhood) and the presence of it (in the adult) correspond well with the fact that both normal and per verse sexuality are derived from the same source namely infantile sexuality There are indeed also cases of perversion which corre spond even more closely to infantile sexuality in that numerous component instincts inde pendently of one another with their aims are developed or better perpetuated in them With these cases it is more correct to speak of in fantilism than of perversion of the sexual life.

Thus prepared we may now go on to consider a sug estion which we shall certainly not be spared It will be said Why are you so set upon declaring as already belonging to sex uality those indefinite manifestations of child hood out of which what is sexual later devel ops and which you yourself admit to be indefinite? Why are you not content rather to describe them physiologically and simply to say that activities such as sucking for its own sake and the retaining of excreta may be ob served already in young infants shown that they seek *pleasure in their organs?* In that way you would have avoided the conception of a sexual life even in babies which is o repug nant to all our feelings Well I can only an swer that I have nothing against pleasure de rived from the organs of the body I know indeed that the supreme pleasure of the sexual union is also only a bodily pleasure derived from the activity of the genital organ But can you tell me when this originally indifferent bodily pleasure acquires the sexual character that it undoubtedly pos esses in later pha es of development? Do we know any more about this *organ pleasure* than we know about ex uality? You will answer that the sexual char acter is added to it when the genitalia begin to play their part sexuality simply means genital You will even evade the obstacle of the perver sions by pointing out that after all with most of them a genital orgasm occurs although brought about by other means than the union of the genitalia If you were to eliminate the relation to reproduction from the essential char acteristics of sexuality since this view is un tenable in consequence of the existence of the perversions and were to emphasize instead activity of the genital organs you would ac tually take up a much better position But then we should no longer differ very widely it would be a case of the genital organs *ve sus* the other

organs. What do you now make of th abundant evidence that the genital organs may be re placed by othe organs for the purpose f grati fication, as in the normal kiss or the perverse prac ces of loose li ın, or in the symptoma tology of hyst ria? In this neurosis it is quite usual for stimulation phenomena sensations, innervations and even the processes of erec tion, which properly belong to the genitalia to be displaced on t other distant areas of the body (g the displacement from below up wards to the head and face) Thus you will find that n thin is l ft f all that you cling to as essentially characteristic of exuality and you will ha e t make up your mi ds to f llow my example and extend the designation *sexual* to includ those acti ties *of early* infancy which aim t *organ-pleasure*

And now will you permit me *to bring for* ward two *further cons derations in* support of my view As you know we call th doubtful and indefinabl acti ties of earliest infancy towards pleasure *exual* because in the course of analysing symptoms we reach them by way of material that is undeniably sexual. They would t thereby necessarily be sexual them selves, let us grant but let us take an analo gous case Suppose that there w re no way to observe the development from seed of two dicotyledonous pla ts—th pple-tree and the bean but imagine that in both t wa pos ibl to f llow back ts development from the fully developed plant to the first seedling with two co yledons The two cotyledons e indistin guishable in each they look exactly al ke in both plants Shall I on lude from this that they ctually are exactly alike and that the specific differences between apple tree and bean plant rise *later* in the plant s dev lopme t? Or is t t *more* correct biol gically to believe that th diff rence *exists al eady in* the seed lines, although I cannot see any in th cotyle dons This is what we d wh w call infan- t p asurable acti it exual. Whether each and every rgan pleasure may be called exual r whethe there exi ts bes d the sexual, an other kind of pleasure that does not deserve this nam is a matt I cann t discu s here I know too little abo t organ plea re and its conditions and I am not t all urprised that, in consequence of the retrogress e character of analy is I rri finally at fact rs which at the present tim do ot permit f d finite classificati n.

One thing m re You have on the whole gained ery little for what y u are so eage to maintain the sexual purity of children even if you can convince me that the infant s acti n ot be regarded as sexual For

period of infantile ... f gratification in the genital organs The mental and ocial sides of sexual life need no longer be o erlooked cho ce of object distinguish. g of particular persons with affection even de cision in favour of one sex or *the other and* jealousy were conclus ely established inde pe dently by *impartial* ob *ervation before* the time of psycho-analysis they *may* be con firmed by any *observer* who will use his eyes. You will object that you never doubted the ea ly awakening of affection but only that this affection was of a *sexual* qual ty Children be- tween the ages of three and eight have cer tainly learnt to conceal this element in it but ne ertheless if you look attentively you will collect n ugh ev de ce of the *sensual* nature of this affecti n, and whatever st'll escapes your otice will be amply and readily supplied by analyt c in estigation The sexual aims in this period of l fe are in closest connection with the sexual curiosity arising at the same time of whi h I ha e gi en you some description The perverse *characte* of some of these aims is a natural result of the immature constitution of the child who has not yet disco ered the aim of the act of inte course.

From about the sixth or e ghth year onwards a standstill or retrogression s bserved in the ... reach ... to be ... period however may be absent nor does it neces sarily entail an interrupti n of sexual acti ities and sexual *interests* o er the whole field. Most of the ment l experien es and *excitations* c curring before th lat ncy *period then suc* cumb to the fantile am esia already d cu sed, which veils o r ea liest childhood from us and estranges us from it It is the task of every psycho-analysis to brin this forgotten ...

... is on is an effect of rep s on

From th thi d year onwards, th sexual life of children hows much in c mmon with that of dults it is d ff renti ted f m the l tter as

we already know by the absence of a stable organization under the primacy of the genital organs by inevitable traits of a perverse order and of course also by far less intensity in the whole impulse But those phases of the sexual development or as we will call it of the *libido development* which are of greatest interest theoretically lie before this period This development is gone throu h so rapidly that direct observation alone would perhaps never have succeeded in determining its fleeting forms Only by the help of psycho analytic investigation of the neuroses has it become possible to penetrate so far back and to discover these still earlier phases of libido-development These phases are certainly only theoretic constructions but in the practice of psycho analysis you will find them necessary and valuable constructions You will soon understand how it happens that a pathological condition enables us to discover phenomena which we should certainly overlook in normal conditions

Thus we can now define the forms taken by the sexual life of the child before the primacy of the genital zone is reached this primacy is prepared for in the early infantile period before the latent period and is premanently organized from puberty onwards In this early period a loose sort of organization exists which we shall call *pre genital* for during this phase it is not the genital component instincts but the *sadistic* and *anal* which are most prominent The contrast between *masculine* and *feminine* plays no part as yet instead of it there is the contrast between *active* and *passive* which may be described as the forerunner of the sexual polarity with which it also links up later That which in this period seems masculine to us regarded from the stand point of the genital phase proves to be the expression of an impulse to mastery which ea ily passes over into cruelty Impulses with a passive aim are connected with the erotogenic zone of the rectal orifice at this period very important the impulses of skoptophilia (gazing) and curiosity are powerfully active the function of excreting urine is the only part actually taken by the genital organ in the sexual life Objects are not wanting to the component instincts in this period but these objects are not necessarily all comprised in one object The sadistic anal organization is the stage immediately preceding the phase of primacy of the genital zone Closer study reveals how much of it is retained intact in the later final structure and what are the paths by which these component instincts are forced into the service of the new *genital organ ation* Behind the sadistic anal phase of the libido development we obtain a glimp e of an even more primitive stage of development in which the eroto enic mouth zone plays the chief part You can guess that the sexual activity of sucking (for its own sake) belongs to this stage and you may admire the understanding of the ancient Egyptians in who e art a child even the divine Horus was represented with a finger in the mouth Abraham has quite recently published work showing that traces of this primitive *oral* phase of development survive in the sexual life of later years

I can indeed imagine that you will have found this last information ab [illegible] orr [illegible] patience! what you have just heard will be of more use when we employ it later Keep in view at the moment the idea that the sexual life—the *libido function* as we call it—does not first spring up in its final form does not even expand along the lines of its earliest forms but goes through a series of successive phases unlike one another in short that many changes occur in it like those in the development of the caterpillar into the butterfly The turning point of this development is the *subordination of all the sexual component instincts under the primacy of the genital one* and together with this the enrolment of sexuality in the service of the reproductive function Before this happens the sexual life is so to say disparate—independent activities of single component impulses each seeking *organ pleasure* (pleasure in a bodily organ) This anarchy is modified by attempts at *pre* genital *organi ations* of which the chief is the sadistic anal phase behind which is the oral perhaps the most primitive In addition there are the various processes about which little is known as yet which effect the transition from one sta e of organization to the next above it Of what significance this long journey over so many stages in the development of the libido is for comprehension of the neuroses we shall learn later on

Today we will follow up another aspect of this development—namely the relation of the sexual component impulses to an *object* or rather we will take a fleeting glimpse over this development so that we may spend more time upon a comparatively late result of it Certain of the component impulses of the sexual instinct have an object from the very beginning

and hold fast to t such are the impulses to mastery (sad.sm) to gaz..g (ko-tophilia) and curios'ty Others more plainl connected with par cu.ar erotogenic areas in the body only have an object in the beginning so long as they are still dependent upon the non exual func tion. and gi e t up when they become detached from these later Thus the first object of t..e oral component of the exual n.tinct is t..e mother s breast which satisfies the infant s need for n-trition. In the act f u kin fo its own sake the erotic compo ent also gratified m r ck.g fo nutrition makes tself indepe d ent, gives up the bject in an external person and replaces it by a part of the child s own person The oral impulse bec mes *auto-erot c* as th a..al and ther erotogenic impulses are from th beginning Further development has, t put it a concisely s poss ble two aims first, t renounce a to-eroti m t gi e up again the bject f und in the child s own body in ex hange again fo a xternal one and sec ond to comb the an us object of the separa e impulses and replace th m by one sin e one This n turally can only be don if the single bject is again itself c mplete with a body like th t f the ubject nor can it be m lished without ome part of the auto-erotic impul..e-excitations being abandoned as use.ess.

Th processes by which an object is found are rather nvolved and ha e t so far received comprehen ive expos t on F r our pur poses t may be emphasized that when the proces has reached a certain point in the years of childhood befo e the latency period th object adopted proves alm t id tical with the first bject f the ral pleasure impulse ad pt ed by reason of the child s depe dent relation s..p t t is namely the m ther although ot the m thers brea t W call the mother the first *lov* -object. We speak of *love* when we lay the cent upon th mental de of th sexual impulses and d regs d or wi..h t forget for momen the demands of the fundam ntal phys cal *sens al* ..d of th impulses. At about the time when the m the becomes the lo -ob ect the mental operati of rep es o has already begun in th child and has withdrawn from him th knowledge of some part of his sexual aims. Now with thi ch of th mother as lo -obj ct is c ted ll that which, *under th nam of th O d pus c mplex* has become f su h great import..nce in the psycho-analyt c explanat n of the euroses a..d whi h has had pe haps equally importa t

hare in causing the opposition agai..t psycho-analysis

Here is a little incident which occurred during the present war One of the staunch adherents of psycho-analysis was stationed in his med cal capac ty on the German front in Poland he attracted the attention of his col leagues by the fact that he occasionally effected an unexpected infl ence upon a patient On be g questioned he adr tted that he worked with psycho-analytic methods and with read ness agreed to impart his knowledge to his colleagues. So every evening the medical men of the corps his colleagues and superiors met to be in tiated into the m steries of psycho-analysis *For a time all went well* but when he had ntroduced his aud ence to the Oed pus complex a superior officer rose and announced that he did n t believe this it was the behaviour of a cad for the lecturer to relate such things to brave men fathers of f milies, who were fighting for their country and he f bade the continuation of th lectures This was the end the analyst got himself tran ferred to an other part of the front. *In my opinion, how ever* it is a bad outlook if a victory for German arms depends upo an organization of science such as this, and German science will not pr spe under a y such organizat on

Now yo will be impat ently wait to hear what thi terrible Oed pus complex comprises. The nam tells ou you all know the Greek myth of Ki g Oed pus whose dest ny t was to slay his f th a d to wed his mother who d d all in his pow r t avo d the fate p ophesied by the racle and who in self punishment blinded himself when he di..co ered that in ignorance he had comm tted both these crimes I trust that many of you have yoursel es experienced the prof und ffect of the tragic drama fash

— Th

de ce t h thus a certain resemblance to the co rs of a psycho-analys In the *dialogue* the d l ded m ther wife Joca..ta, res s the cont uation f the e quiry he points o t tha many peopl in th dreams ha e mated with th ir mothers b t that dreams are f n ac ount, T us dream re of much account especially t p cal d eams which occur in many people we have n d ubt that the dream Joca ..a speaks f intim t ly rel ted to the shocking and terribl story of the myth.

It is surprising that Sophocles tragedy does not call forth indignant remonstrance in its audience this reaction would be much better justified in them than it was in the blunt army doctor For at bottom it is an immoral play it sets aside the individual s responsibility to social law and displays divine forces ordaining the crime and rendering powerless the moral instincts of the human being which would guard him against the crime It would be easy to believe that an accusation against destiny and the gods was intended in the story of the myth in the hands of the critical Euripides at variance with the gods it would probably have become such an accusation But with the reverent Sophocles there is no question of such an intention the pious subtlety which declares it the highest morality to bow to the will of the gods even when they ordain a crime helps him out of the difficulty I do not believe that this moral is one of the virtues of the drama but neither does it detract from its effect it leaves the hearer indifferent he does not react to this but to the secret meaning and content of the myth itself He reacts as thou h by self analysis he had detected the Oedipus complex in himself and had recognized the will of the gods and the oracle as glorified disguise [illegible] own [illegible] himse[illegible] in his [illegible] his mother and must abhor the thou ht The poet s words seem to him to mean In vain do you deny that you are accountable in vain do you proclaim how you have striven a ainst these evil designs You are guilty nevertheless for you could not stifle them they still survive unconsciously in you And psychological truth is contained in this even though man has repressed his evil desires into his Unconscious and would then gladly say to himself that he is no longer answerable for them he is yet compelled to feel his responsibility in the form of a sense of guilt for which he can discern no foundation

There is no possible doubt that one of the most important sources of the sense of guilt which so often torments neurotic people is to be found in the Oedipus complex More than this in 1913 under the title of *Totem and Taboo* I published a study of the earliest forms of religion and morality in which I expressed a su picion that perhaps the sense of guilt of mankind as a whole which is the ultimate source of religion and morality was acquired in the beginnings of history through the Oedipus complex. I should much like to tell you more of this but I had better not it is difficult to leave this subject when once one begins upon it and we must return to individual psychology

Now what does direct observation of children at the period of object choice before the latency period show us in regard to the Oedipus complex? Well it is easy to see that the little man wants his mother all to himself finds his father in the way becomes restive when the latter takes upon himself to caress her and shows his satisfaction when the father goes away or is absent He often expresses his feelings directly in words and promises his mother to marry her this may not seem much in comparison with the deeds of Oedipus but it is enough in fact the kernel of each is the same Observation is often rendered puzzling by the circumstance that the same child on other occasions at this period will display great affection for the father but such contrasting—or better *ambivalent*—states of feeling which in adults would lead to conflicts can be tolerated alongside one another in the child for a long time just as later on they dwell together permanently in the unconscious One might try to object that the little boy s behaviour is due to egoistic motives and does not justify the conception of an erotic complex the mother looks after all the child s needs and consequently it is to the child s interest that she should trouble herself about no one else This too is quite correct but it is soon clear that in this as in similar dependent situations egoistic interests only provide the occasion on which the erotic impulses seize When the little boy shows the most open sexual curiosity about his mother wants to sleep with her at night insists on being in the room while she is dressing or even attempts physical acts of seduction as the mother so often observes and lau hingly relates the erotic nature of this attachment to her is established without a doubt Moreover it should not be forgotten that a mother looks after a little daughter s needs in the same way without producing this effect and that often enough a father eagerly vies with her in trouble for the boy without succeeding in winning the same importance in his eyes as the mother In short the factor of sex preference is not to be eliminated from the situation by any criticisms From the point of view of the boy s egoistic interests it would merely be foolish if he did not tolerate two people in h s service rather than only one of them

As you see I have only described the rela

trees up of a boy to his father and mother times proceed in just the same way with the necessary reversal in little girls. The loving devotion to the father, the need to do away with the superfluous mother and to take her place, the early display of coquetry and the arts of later womanhood, make up a particularly charming picture in a little girl, and may cause us to forget its seriousness and the grave consequences which may later result from this situation. Let us not fail to add that frequently the parents themselves exert a decisive influence upon the awakening of the Oedipus complex in a child by themselves following the sex attraction where there is more than one child the father in an unmistakable manner prefers his little daughter with marks of tenderness and the mother the son but even this factor does not seriously impugn the spontaneous nature of the infantile Oedipus complex. When other children appear the Oedipus complex expands and becomes a family complex. Reinforced anew by the injury resulting to the egoistic interests it actuates a feeling of aversion towards these new arrivals and an unhesitating wish to get rid of them again. These feelings of hatred are as a rule much more often openly expressed than those connected with the parental complex. If such a wish is fulfilled and after a short time death removes the unwanted addition to the family later analysis can show what a significant event this death is for the child, although it does not necessarily remain in memory. Forced into the second place by the birth of another child and for the first time almost entirely parted from the mother the child finds it very hard to forgive her for this exclusion of him; feelings which in adults we should describe as profound embitterment are roused in him, and often become the groundwork of a lasting estrangement. That sexual curiosity and all its consequences is usually connected with these experiences has already been mentioned. As these new brothers and sisters grow up the child's attitude to them undergoes the most important transformations. A boy may take his sister as love-object in place of his faithless mother; where there are several brothers to win the favour of a little sister hostile rivalry of great importance in after life, shows itself already in the nursery. A little girl takes an older brother as a substitute for the father who no longer treats her with the same tenderness as in her earliest years or she takes a little sister as a substitute for the child that she vainly wished for from her father.

So much and a great deal more of a similar kind is shown by direct observation of children, and by consideration of clear memories of childhood uninfluenced by any analysis. Among other things you will infer from this that a child's position in the sequence of brothers and sisters is of very great significance for the course of his later life, a factor to be considered in every biography. What is even more important, however, is that in the face of these enlightening considerations so easily to be obtained, you will hardly recall without smiling the scientific theories accounting for the prohibition of incest. What has not been invented for this purpose! We are told that sexual at... members of the...

mental equivalent in the horror of incest! Whereby it is entirely overlooked that no such rigorous prohibitions in law and custom would be required if any trustworthy natural barriers against the temptation to incest existed. The opposite is the truth. The first choice of object in mankind is regularly an incestuous one, directed to the mother and sister of men, and the most stringent prohibitions are required to prevent this sustained infantile tendency from being carried into effect. In the savage and primitive peoples surviving today the incest prohibitions are a great deal stricter than with us. Theodor Reik has recently shown in a brilliant work that the meaning of the savage rites of puberty, which represent re-birth, is the loosening of the boy's incestuous attachment to the mother and his reconciliation with the father.

Mythology will show you that incest, ostensibly so much abhorred by men, is permitted to their gods without a thought, and from ancient history you may learn that incestuous marriage with a sister was prescribed as a sacred duty for kings (the Pharaohs of Egypt and the Incas of Peru); it was therefore in the nature of a privilege denied to the common herd.

Incest with the mother is one of the crimes of Oedipus and parricide the other. Incidentally these are the two great offences condemned by totemism, the first social religious institution of mankind. Now let us turn from the direct observation of children to the analytic investigation of adults who have become neurotic: what does analysis yield in further knowledge of the Oedipus complex? Well, this is soon told. The complex is revealed just as the myth re-

lates it it will be seen that every one of these neurotics was himself an Oedipus or what amounts to the same thing has become a Hamlet in his reaction to the complex To be sure the analytic picture of the Oedipus complex is an enlarged and accentuated edition of the infantile sketch the hatred of the father and the death wishes against him are no longer vague hints the affection for the mother declares itself with the aim of possessing her as a woman Are we really to accredit such grossness and intensity of the feelings to the tender age of childhood or does the analysis deceive us by introducing another factor? It is not difficult to find one Every time anyone describes anything past even if he be a historian we have to take into account all that he unintentionally imports into that past period from present and intermediate times thereby falsifying it With the neurotic it is even doubtful whether this retroversion is altogether unintentional we shall hear later on that there are motives for it and we must explore the whole subject of the *retrogressive phantasy-making* which goes back to the remote past We soon discover too that the hatred against the father has been strengthened by a number of motives arising in later periods and other relationships in life and that the sexual desires towards the mother have been moulded into forms which would have been as yet foreign to the child But it would be a vain attempt if we endeavoured to explain the whole of the Oedipus complex by *retrogressive phantasy making* and by motives originating in later periods of life The infantile nucleus with more or less of the accretions to it remains intact as is confirmed by direct observation of children

The clinical fact which confronts us behind the form of the Oedipus complex as established by analysis now becomes of the greatest practical importance We learn that at the time of puberty when the sexual instinct first asserts its demand in full strength the older familiar incestuous objects are taken up again and again invested by the libido The infantile object choice was but a feeble venture in play as it were but it laid down the direction for the object choice of puberty At this time a very intense flow of feeling towards the Oedipus complex or in reaction to it comes into force since their mental antecedents have become intolerable however these feelings must remain for the most part outside consciousness From the time of puberty onward the human individual must devote himself to the great task of *freeing himself from the parents* and only after this detachment is accomplished can he cease to be a child and so become a member of the social community For a son the task consists in releasing his libidinal desires from his mother in order to employ them in the quest of an external love object in reality and in reconciling himself with his father if he has remained antagonistic to him or in freeing himself from his domination if in the reaction to the infantile revolt he has lapsed into subservience to him These tasks are laid down for every man it is noteworthy how seldom they are carried throu h ideally that is how seldom they are solved in a manner psychologically as well as socially satisfactory In neurotics however this detachment from the parents is not accomplished at all the son remains all his life in subjection to his father and incapable of transferring his libido to a new sexual object In the reversed relationship the daughter s fate may be the same In this sense the Oedipus complex is justifiably regarded as the kernel of the neuroses

You will imagine how incompletely I am sketching a large number of the connections bound up with the Oedipu complex which practically and theoretically are of great importance I shall not go into the variations and possible inversions of it at all Of its less immediate effects I should like to allude to one only which proves it to have influenced literary production in a far reaching manner Otto Rank has shown in a very valuable work that dramatists throughout the ages have drawn their material principally from the Oedipus and incest complex and its variations and masked forms It hould also be remarked that long before the time of psycho analys s the two criminal offences of Oedipus were recognized as the true expressions of unbridled instinct Among the works of the Encyclopaedist Diderot you will find the famous dialogue *Le neveu de Rameau* which was translated into German by no less a person than Goethe There you may read these remarkable words *S le petit sauvage était abandonné à lui meme qu il conserva toute son imbecillité et qu il réunit au peu de raison de l enfant au berceau la violence des passions de l homme de t ente ans il tordrait le cou à son père et coucherait avec sa mère*

If th y g sa g w f ft t h mself so that h could keep ll h fool h ss d ld u lt t the sl ght reaso of the b by th cr b the lent m t s f ma f th ty h w ld w g th neck of his f the a d g to bed w th his m th —ED

There is yet one thing more which I cannot pass over. The mother-wife of Oedipus must not remind us of dreams in vain. Do you still remember the results of our dream-analyses: how so often the dream-forming wishes proved perverse and incestuous in their nature or betrayed an unsuspected enmity to near and beloved relatives? We then left the source of these evil strivings of feeling unexplained. Now you can answer this question yourselves. They are dispositions of the libido and investments of objects by libido belonging to early infancy and long since given up in conscious life, but which at night prove to be still present and in a certain sense capable of activity. But since all men and not only neurotic persons have perverse, incestuous and murderous dreams of this kind, we may infer that those who are normal today have also made the passage through the perversions and the object-investments of the Oedipus complex, and that this is the path of normal development, only that neurotics show in a magnified and exaggerated form what we also find revealed in the dream-analyses of normal people. And this is one of the reasons why we chose the study of dreams to lead up to that of neurotic symptoms.

TWENTY-SECOND LECTURE

ASPECTS OF DEVELOPMENT AND REGRESSION. AETIOLOGY

As we have heard, the libido function goes through an extensive development before it can enter the service of reproduction in the way that is called normal. Now I wish to show you the significance of this fact for the causation of the neuroses.

I think that it will be in agreement with the doctrines of general pathology to assume that such a development involves two dangers: first, that of *inhibition* and secondly that of *regression*. That is to say, owing to the general tendency to variation in biological processes it must necessarily happen that not all these preparatory phases will be passed through and completely outgrown with the same degree of success; some parts of the function will be permanently arrested at these early stages, with the result that with the general development there goes a certain amount of inhibited development.

Let us seek analogies to these processes in other fields. When a whole people leaves its dwellings in order to seek a new country, as often happened in earlier periods of human history, their entire number certainly did not reach the new destination. Apart from losses due to other causes, it must invariably have happened that small groups or bands of the migrating people *halted on the way* and settled down in these stopping places, while the main body went further. Or to take a nearer comparison, you know that in the higher mammals the seminal glands, which are originally located deep in the abdominal cavity, begin a movement at a certain period of intra-uterine development which brings them almost under the skin of the pelvic extremity. In a number of males it is found that one of this pair of organs has remained in the pelvic cavity, or else that it has taken up a permanent position in the inguinal canal which both of them had to pass through on the journey, or at least that this canal has not closed as it normally should after the passage of the seminal glands through it. When as a young student I was doing my first piece of scientific research under von Brücke, I was working on the origin of the dorsal nerve-roots in the spinal cord of a small fish still very archaic in form. I found that the nerve fibres of these roots grew out of large cells in the posterior horn of the grey matter, a condition which is no longer found in other vertebrates. But soon after I discovered that *similar nerve-cells were to be found outside* the grey matter along the whole length to the so-called spinal ganglion of the posterior roots, from which I concluded that the cells of this ganglion had moved out of the spinal cord along the nerve roots. Evolutionary development shows this too; in this little fish however the whole route of this passage was marked by cells arrested on the way. Closer consideration will soon show you the weak points of these comparisons. Therefore let me simply say that we consider it possible that single portions of every separate sexual impulse may remain in an early stage of development, although at the same time other portions of it may have reached their final goal. You will see from this that we conceive each such impulse as a current continuously flowing from hm

si that these conceptions require further elucidation is correct but the attempt would lead us too far afield. We will however decide at this point to call this *arrest in a* component

impulse at an early stage a FIXATION (of the impulse)

The second danger in a development by stages such as this we call REGRESSION it also happens that those portions which have pro ceeded further may easily revert in a back ward direction to these earlier stages The impulse will find occasion to *regress* in this way when the exercise of its function in a later and more developed form meets with powerful external obstacles which thus prevent it from attaining the goal of satisfaction It is a short step to assume that fixation and regression are not independent of each other the stronger the fixations in the path of development the more easily will the function yield before the external obstacles by regressing on to those fixations that is the less capable of resistance against the external difficulties in its path will the developed function be If you think of a migrating people who have left large numbers at the stopping places on their way you will see that the foremost will naturally fall back upon these positions when they are defeated or when they meet with an enemy too strong for them And again the more of their number they leave behind in their progress the sooner will they be in danger of defeat

It is important for comprehension of the neuro es that you should keep in mind this relation between fixation and regression You will thus acquire a secure foothold from which to investigate the causation of the neuroses—their aetiology—which we shall soon consider

For the present we will keep to the question of regression After what you have heard about the development of the libido you may antici pate two kinds of regression a return to the first objects invested with libido which we know to be incestuous in character and a re turn of the whole sexual organization to earlier stages Both kinds occur in the transference neuroses and play a great part in their mecha nism In particular the return to the first incestuous objects of the libido is a feature found with quite fatiguing regularity in neu rotics There is much more to be said about the regressions of libido if another group of neuroses called the narcissistic is taken into account but this is not our intention at the moment These affections yield conclusions about other developmental processes of the libido function not yet mentioned and also show us new types of regression correspond n with them I think however that I had better warn you now above all not to confound *regression* with *repression* and that I must assist you to clear your minds about the re lation between the two proces es *Repression* as you will remember is the process by which a mental act capable of becomin conscious (that is one which belongs to the preconscious system) is made unconscious and forced back into the unconscious system And we also call it *repression* when the unconscious mental act is not permitted to enter the adjacent precon scious system at all but is turned back upon the threshold by the censorship There is therefore no connection with sexuality in the concept *repression* please mark this very care fully It denotes a purely psychological process and would be even better described as *topo graphical* by which we mean that it has to do with the spatial relationships we assume within the mind or if we again abandon these crude aids to the formulation of theory with the structure of the mental apparatus out of sep arate psychical systems

The comparisons just now instituted showed us that hitherto we have not been using the word *regression* in its general sense but in a quite specific one If you give it its general sense that of a reversion from a higher to a lower stage of development in general then repression also ranges *itself* under regres ion for repression can also be described as rever sion to an earlier and lower stage in the de velopment of a mental act Only in repression this retrogressive direction is not a point of any moment to us for we also call it repression in a dynamic sense when a mental process is arrested before it leaves the lower stage of the unconscious Repression is thus a topo graphic dynamic conception while regression is a purely descriptive one But what we have

1

1 u opment that is something which i essentially quite different from repression and quite independent of it Nor can we call regres sion of the libido a purely psychical process neither do we know where to localize it in the mental apparatus for though it may exert the most powerful influence upon mental life the organic factor in it is nevertheless the most prominent

Discussions of this ort tend to be rather dry therefore let us turn to clinical illustra tions of them in order to get a more vivid impression of them You know that the group of the transference neuroses consists principally

of hysteria a d the obses on l neuro is Now in hy teria a egres on of the libido t th primary in estuous s xual objects is without r m t regul r b t the e is little r no

component impulses unde the primacy of the genital zon has been accomplished but the results of this unio meet with res stance from the directio of the p econsc ous sy tem w th which c ns us ess connected The genital organizatio therefore holds good f r th un con cious b t not also f r th preconsc us and thi rejection n the part of the preco scious re ults in a picture which has a certain likeness to the state prior to the primacy of the genital o e It is nev rtheless actually quite diff rent Of the two ki ds of regres on of the libid th t on to an ea lier phase of sexual o ganization is m ch th more *striking* Sin t i ab nt in hysteria and our wh le co ception of the e roses is still f r too much — n wh ch came

of view will undergo till further xtens ons and alt rat ons when we incl de cons derat on of still other neuroses (th narci st c) in ddit *to* hysteria and the obse sional neurosis.

In the obsessional euros on the other hand regression of th libid to th antecedent stage of th sadist anal rganiz t is the most nsp cuo fact and d term nes the f rm taken by the sympt ms Th impuls to lov must then mask tself und r th s distic impulse The obsess e thought I should like t m rder you means (when it has been d tached from *certain superimposed elem ts* that ar ot h wever accid tal but indispen sable t t) nothing lse but I should like to njoy l of you When y u onsider in ad dit that egr si to the primary obj cts has also set in t the same tim so that this impulse cerns only the nearest and most beloved persons you can gain om dea of the horro r used in the patient by these bsess e ues nd t th same time h w una countable they ppear to his c nsc us percepti B t rep ession als has ts hare great o e in the

mechanism of this neurosis and one wh ch is not easy to expound n a rapid survey such as this Regression of libido w thout *repression would never g ve rise* to a neurosis but would result in a perversion You will see from this that repression is the process which d stin guishes the neuroses *particularly* and by wh ch they are best characterized Perhaps however I may have an opportunity at some time of expounding to you what we know of the mech anism of the *perversions* and you will then see that there again noth ng *proceeds so s mply* as we sho ld like to imagine in our construction

I think that you will be soonest reco ciled to this expos tion of fixation and regression of the libido if you will regard it as preparatory to a study of the *aetiology* of the neuroses So far I have *nly given you one p ece of infor* mation on this subject namely that people fall ill of a neuros s when the possibi ity of sat faction for th libido is removed from them—they fall ill in conseque ce of a *f us t atio* as I called it therefore—and that their symptoms are actually substitutes for the *missing satisfaction This of course does n t* mean that e ery frustrat on in regard to l b d inal satisfact on makes everyone who meets with it neurotic but merely that in all cases of neu os s investigated the factor of frustra tion was dem nstrable The statement, there fo e cann t be reversed You will no doubt ha e *understood that this statement was not* inte ded to re eal the whole secret of th aet ology f the neu o es but that it merely emph sized an important and indispe sable c ndit on

N w in order to consider this propo t o furth r we do not know whether to begin upon *the nature of the frustratio* or *the particular* characte of the person affected by it The fru trati n is very rarely a comprehen ive and bsolute on n order to have a pathogenic eff t it would p obably have to strike at the o ly f rm f sat sf ti n which that pers des res the only form of which he is c pable In g neral, there are very many w ys by which it is poss ble to endure lack of libidinal satis f cti n with t fall g ill Above all we know of people wh are able *to take* uch abstinence upon themsel es without injury they are then t happy they suffe f om unsatisfied l gin but they d not become ill We therefo ha e t o clude that the sexual imp lse-excitat s are excepti nally plasti f I may us the word. One of them can step n place of ther f sati f ct n f one is d *nied in*

reality satisfaction of another can offer full recompense They are related to one another like a network of communicating canals filled with fluid and this in spite of their subordination to the genital primacy a condition which is not at all easily reduced to an image Further the component instincts of sexuality as well as the united sexual impulse which comprises them show a great capacity to change their object to exchange it for another—i e for one more easily attainable this capacity for displacement and readiness to accept surrogates must produce a powerful counter effect to the effect of a frustration One amongst these processes serving as protection against illness arising from want has reached a particular significance in the development of culture It consists in the abandonment on the part of the sexual impulse of an aim previously found either in the gratification of a component impulse or in the gratification incidental to reproduction and the adoption of a new aim—which new aim though genetically related to the first can no longer be regarded as sexual but must be called social in character We call this process SUBLIMATION by which we subscribe to the general standard which estimates social aims above sexual (ultimately selfish) aims Incidentally ublimation is merely a special case of the connections existing between exual impulses and other asexual ones We shall have occasion to discuss this again in another context

Your impression now will be that we have reduced want of satisfaction to a factor of negligible proportions by the recognition of so many means of endurin it But no this is not so it retains its pathogenic power The mean of dealing with it are not always sufficient The measure of unsatisfied libido that the average human bein can take upon himself is limited The plasticity and free mobility of the libido is not by any means retained to the full in all of us and sublimation can never discharge more than a certain proportion of libido apart from the fact that many people possess the capacity for sublimation only in a slight degree The most important of these limitations is clearly that referring to the mobility of the libido since it confines the individual to the attaining of aims and objects which are very few in number Just remember that incomplete development of the libido leaves behind it very extensive (and sometimes also numerous) libido fixations upon earlier phases of organization and types of object choice mostly incapable of satisfaction in reality you will then recognize fixation of libido as the second powerful factor working together with frustration in the causation of illness We may condense this schematically and say that libido-fixation represents the internal predispo ing factor while frustration represents the external, accidental factor in the aetiology of the neuroses

I will take this opportunity to warn you against taking sides in a quite superfluous dispute It is a popular habit in scientific matters to seize upon one side of the truth and set it up as the whole truth and then in favour of that element of truth to dispute all the rest which is equally true More than one faction has already split off in this way from the psycho analytic movement one of them recognizes only the egoistic impulses and denies the sexual another perceives only the influence of real tasks in life but overlooks that of the individual s past life and so on Now here is occasion for another of these antitheses and moot points Are the neuroses exogenous or endogenous diseases—the inevitable result of a certain type of constitution or the product of certain *injurious* (traumatic) events *in* the person s life? In particular are they brought about by the fixation of *libido* and the rest of the sexual constitution or by the pressure of frustration? This dilemma seems to me about as sensible as another I could point to Is the child created by the father s act of generation or by the conception in the mother? You will properly reply Both conditions are alike indispensable The conditions underlying the neuroses are very similar if not exactly the same From the point of view of cau ation cases of neurotic illness fall into a *series* within which the two factors—sexual constitution and events experienced or if you wish fixation of libido and frustration—are represented in such a way that where one of them predominates the other

L n i whatever happened whatever they experienced however merciful life has been to them because of their anomalous libido development At the other end stand cases which call forth the opposite verdict—they would undoubtedly have escaped *illness* if life had not put such and such burdens upon them In the intermediate ca es in the series more or less of the disposing factor (the sexual constitution) is comb ned with less or more

of the injurious impositions of life. Their sexual constitution would not have brought about their neurosis if they had not gone through such and such experiences, and life's vicissitudes would not have worked traumatically upon them if the libido had been otherwise constituted. In this series I can perhaps admit a certain preponderance in the effect of the predisposing factor, but this admission again depends upon where you draw the line in marking the boundaries of nervousness.

I shall now suggest to you that we should call series such as these *complemental series* and will inform you beforehand that we shall find occasion to establish others of this kind.

The tenacity with which the libido holds to particular channels and particular objects, the *adhesiveness* of the libido so to say, seems to be an independent fact, varying in individuals, the determining conditions of which are completely unknown to us, but the importance of which in the aetiology of the neuroses we shall certainly no longer underestimate. At the same time we should not overestimate the close relation between the two things. A similar adhesiveness of the libido occurs—from unknown causes—in normal people under numerous conditions, and is found as a decisive factor in those persons who in a certain sense are the extreme opposite of neurotics—namely, perverted persons. It was known before the time of psycho-analysis that in the anamnesis of such persons a very early impression, relating to an abnormal instinct-tendency or object choice, is frequently discovered, to which the libido of that person henceforth remains attached for life (Binet). It is often hard to say what has enabled this impression to exert such an intense power of attraction upon the libido. I will describe a case of this kind observed by myself. A man to whom the genitals and all the other attractions of woman now mean nothing, can be aroused to irresistible sexual excitation only by a shoe-clad foot of a certain shape. He can remember an event in his sixth year which determined this fixation of libido. He was sitting upon a stool by the side of his governess who was to give him an English lesson. She was a plain, elderly, shrivelled old maid, with watery blue eyes and a snub nose, and on this day she had hurt her foot and had it therefore stretched out on a cushion in velvet slipper with the leg itself most decorously concealed. Later on, after a timid attempt at normal sexual activity during puberty, a thin sinewy foot like that of the governess became his only sexual object, and if still other features in the person reminded him of the English type of woman represented by the English governess, the man was helplessly attracted. This fixation of the libido, however, rendered him not neurotic but perverse; he became, as we say, a foot fetichist. So you see that although an excessive and in addition premature fixation of libido is an indispensable condition in the causation of neuroses, the extent of its influence far exceeds the boundaries of the neuroses. This condition by itself is also as little decisive as the frustration mentioned previously.

So the problem of the causation of the neuroses seems to become more complicated. In fact, psycho-analytic investigation acquaints us with yet a new factor not considered in our aetiological series, and best observed in some one whose previous good health is suddenly disturbed by falling ill of a neurosis. In these people signs of contradictory and opposed wishes or, as we say, of *mental conflict* are regularly found. One side of the personality stands for certain wishes while another part struggles against them and fends them off. There is no neurosis without such a CONFLICT. There might seem to be nothing very special in this. You know that mental life in all of us is perpetually engaged with conflicts that have to be decided. Therefore it would seem that special conditions must be fulfilled before such a conflict can become pathogenic. We may ask what these conditions are, what forces in the mind take part in these pathogenic conflicts and what relation conflict bears to the other causative factors.

I hope to be able to give you answers to these questions which will be satisfactory although perhaps schematically condensed. Conflict is produced by frustration, in that the libido which lacks satisfaction is urged to seek other paths and other objects. A condition of it then is that these other paths and objects arouse disfavour in one side of the personality, so that a veto ensues which at first makes the new way of satisfaction impossible. This is the point of departure for the formation of symptoms which we shall follow up later. The rejected libidinal longings manage to pursue their course by circuitous paths, though not indeed without paying toll to the prohibition in the form of certain disguises and modifications. The circuitous paths are the ways of symptom formation; the symptoms are the

new and substitutive satisfactions necessitated by the fact of the frustration

The significance of the mental conflict can be defined in another way thus in order to become pathogenic *external* frustration must be supplemented by *internal* frustration When this is so the external and the internal frustration relate of course to different paths and different objects external frustration removes one possibility of satisfaction internal frustration tries to exclude another possibility and it is this second possibility which becomes the debatable ground of the conflict I choose this form of presentation because it conta [illegible]

[illegible] out of real external obstacles

But what are these forces out of which the prohibition against the libidinal longings proceeds the other parties in the pathogenic conflict? Speaking very broadly we may say that they are the non sexual instincts We include them all under the name *ego instincts* analysis of the transference neuroses offers no adequate opportunity for further investigation of them at most we learn something of them from the resistances opposed to the analysis The pathogenic conflict is therefore one between the ego instincts and the sexual instincts In a whole series of cases it looks as though there might also be conflict between various purely sexual impulses at bottom however this is the same thing because of the two sexual impulses engaged in a conflict one will always be found *consistent with the ego* (ego syntonic) while the other calls forth a protest from the ego It remains therefore a conflict between ego and sexuality

Over and over again when psycho analysis has regarded something happening in the mind as an expression of the sexual instincts indignant protests have been raised to the effect that other instincts and other interests exist in mental life besides the sexual that one should not derive everything from sexuality and so on Well it is a real pleasure for once to be in agreement with one s opponents Psycho analysis has never forgotten that non sexual instincts also exist it has been built upon a sharp distinction between sexual instincts and ego instincts and in the face of all opposition it has insisted *not* that they arise from sexuality but that the neuroses owe their origin to a *conflict* between ego and sexuality It has no conceivable motive in denying the existence or the significance of the ego instincts while it investigates the part played by sexual instincts in disease and in life generally Only psycho analysis has been destined to concern itself first and foremost with the sexual instincts because in the transference neuroses the e are the most accessible to investigation and because it was obliged to study what others had neglected

It is not any more accurate to say that psycho analysis has not occupied itself at all with the non sexual side of the personality The very distinction between the ego and sexuality has shown us with particular clearness that the ego instincts also undergo an important development which is neither entirely independent of the development of the libido nor without influence upon the latter We certainly understand the development of the ego much less well than the development of the libido because it is only by the study of the narcissistic neuroses that we have just reached some hope of insight into the structure of the ego Nevertheless we have already a notable attempt on the part of Ferenczi to reconstruct theoretically the developmental sta es of the ego and there are at least two points at which we have a secure foothold from which to examine this development further We are not at all disposed to think that the libidinal interests of a human being are from the outset in opposition to the interests of self preservation the e o is rather impelled at every stage to attempt to remain in harmony with the corresponding stage of sexual organization and to accommodate itself to that The succession of the separate phases in the development of the libido probably follows a prescribed course it is undeniable however that this course may be influenced from the direction of the ego A certain parallelism a definite correspondence between the phases in the two developments (of the ego and of the libido) may also be assumed indeed a disturbance in this corre pondence may become a pathogenic factor More important to us is the question of how the e o behaves when the libido has undergone a powerful fixation at an earlier point in its development The ego may countenance the fixation and will then be perverse to that extent or what is the same thing infantile it

F *C t b llo t Psych A ly* E g lish tr nsl t by Ernest J nes (916) chap L p 8

may however hold self averse from this a tachment of lib do the result of which is that where the lib do undergoes a *fixation* there the ego institutes an act of *repression*

In this way we arrive at the conclus on that the third facto in the aetiology of the neuroses, the susceptibility t conflict, is as much con nected with the deve opment of the ego as with the deve opmen of the libido our insig t into the causation of the neuroses is thus enlarged. First, there is the most general condi ion f priva ion, then the fixation of libido (forcing it in o particular chann ls) and *thirdly* the *susc ti ty to con ct* produced by the de velopment f the ego having repudiated libid. nal solutions f that particular kind The thing i theref re, ot so very obscure and intricat as you probably thought t during the course of my expos ion. To be ure though, after all, we ha e ot done with it yet there is still somethi new to add and something we already know t dissect f rther

In order to demons rate the ffect of the development f the eg upon the tendency to conflict and therewith upon the causat on of the neuroses I will quo an example whi h, although entirely imaginary is n t at all im probable in any respect I will gi e it th title of Nestroy s farce *O the G ound Floor and in the Mansion*. Suppose that a caretaker is living on the ground floor of house whil the owner rich and well-connected man, li es bove They both ha e children, and w will assume that the own little girl is permitted t pla freely without supervi on with th child f lower social tanding It may then very easily happen that the games bec m "naugh that is take sexual character that they play f ther and mother watch each other in the perf rma f intimate cts and stimulate ea h othe s genital parts The care taker daught r ma ha e played th temptress in this ce in sp t f h fi e six years she has been bl to learn great deal bout sexual matters. These occurrences even though they re only kept up f h rt period, will be enough t rouse certain sexual excitat ons in both children which will com t expres on in the practice of masturbat for a few years after th games ha e been discontinued. There is common ground so f but th final result will be very different in the tw hildren. The caretaker daughter will co ue masturba tion, perhaps up to the onset f menstruation, and then give t up without difficulty few years later will find a lover perhaps bear a child choose this or that path in life perhaps become a popula actress and end as an aristo crat. Probably he career will turn out less brilliantly bu in any case he will be unharmed by the premature exual activ ty free from neurosi and able to live her life. Very differ ent is the result in the other child. She will very soon whi e yet child, acquire a sense of ha m done wrong after a fairly short time e will give up the masturbatory satisfaction, though perhaps only with a tremendous trug gl but will nevertheless retain an inner feeling of subdued depres on When later on as a oung girl he comes to learn somethin of sexual i tercourse he will turn from it with inexplicable horror and wish to remain ignoran Probably she will then again suffer a fresh ir resistible impulse t masturbation about wh ch s will n t dare to unburden herself to any one When the time comes for a man t choose her as wif the neuros s will break out and cheat her out f *marriage and the joy of life* If analysis makes t possible to obtain an in sight into this neurosis, it will be found that this well-brought-up intelligent and ideali t girl has comple el repressed her exual desires but that they are unconsciously attached to the few l ttle experiences he had with the childish play mate

The differences which ensue in these two destinies in spite of the common experiences undergone arise because in one girl the ego has sustained a development absent in the other To the caretaker s dau hter sexual activity seemed as *natural and harmless in later years* in childhood. The gentleman s daught r had been "well bro ght-up and had adopted the tandards of her ed cat on Thus stimulated her ego had formed deals of womanly purity and absence of desire that were incompatible with exual ct her intellectual trainin h d caused her t depreciat th feminine role f whi h h is intended. This higher moral and int llectual development in her ego has brought her into conflict with the claims of her sexuality

I will explore one more aspect of the devel opment of the lib do today both because it leads out upon certain wide prospects, and also because it is well-suited to justify the sharp and immediat ly obv ous line of dem ca ti n we are wont t draw between ego-instincts and sexual instincts In c ns dering the two developments undergone by th eg and by the

new and substitutive satisfactions necessitated by the fact of the frustration

The significance of the mental conflict can be defined in another way thus in order to become pathogenic *external* frustration must be supplemented by *internal* frustration When this is so the external and the internal frustration relate of course to different paths and different objects external frustration removes one possibility of satisfaction internal frustration tries to exclude another possibility and it is this second possibility which becomes the debatable ground of the conflict I choose this form of presentation because it contains a certain implication it implies that the internal impediment arose originally in primitive phases of human development out of real external obstacles

But what are these forces out of which the prohibition against the libidinal longings proceeds the other parties in the pathogenic conflict? Speaking very broadly we may say that they are the non sexual instincts We include them all under the name *ego instincts* analysis of the transference neuroses offers no adequate opportunity for further investigation of them at most we learn something of them from the resistances opposed to the analysis The pathogenic conflict is therefore one between the ego instincts and the sexual instincts In a whole series of cases it looks as though there might also be conflict between various purely sexual impulses at bottom however this is the same thing because of the two sexual impulses engaged in a conflict one will always be found *consistent with the ego* (ego syntonic) while the other calls forth a protest from the ego It remains therefore a conflict between ego and sexuality

Over and over again when psycho analysis has regarded something happening in the mind as an expression of the sexual instincts indignant protests have been raised to the effect that other instincts and other interests exist in mental life besides the sexual that one should not derive everything from sexuality and so on Well it is a real pleasure for once to be in agreement with one s opponents Psycho analysis has never forgotten that non sexual instincts also exist it has been built upon a sharp distinction between sexual instincts and ego instincts and in the face of all opposition it has insisted *not* that they arise from sexuality but that the neuroses owe their origin to a *conflict* between ego and sexuality It has no conceivable motive in denying the existence or the significance of the ego instincts while it investigates the part played by sexual instincts in disease and in life generally Only psycho-analysis has been destined to concern itself first and foremost with the sexual instincts because in the transference neuroses these are the most accessible to investigation and because it was obliged to study what others had neglected

It is not any more accurate to say that psycho analysis has not occupied itself at all with the non sexual side of the personality The very distinction between the ego and sexuality has shown us with particular clearness that the ego instincts also undergo an important development which is neither entirely independent of the development of the libido nor without influence upon the latter We certainly understand the development of the ego much less well than the development of the libido because it is only by the study of the narcissistic neuroses that we have just reached some hope of insight into the structure of the ego Nevertheless we have already a notable attempt on the part of Ferenczi to reconstruct theoretically the developmental stages of the ego and there are at least two points at which we have a secure foothold from which to examine this development further We are not at all disposed to think that the libidinal interests of a human being are from the outset in opposition to the interests of self preservation the ego is rather impelled at every stage to attempt to remain in harmony with the corresponding stage of sexual organization and to accommodate itself to that The succession of the separate phases in the development of the libido probably follows a prescribed course it is undeniable however that this course may be influenced from the direction of the ego A certain parallelism a definite correspondence between the phases in the two developments (of the ego and of the libido) may also be assumed indeed a disturbance in this correspondence may become a pathogenic factor More important to us is the question of how the ego behaves when the libido has undergone a powerful fixation at an earlier point in its development The ego may countenance the fixation and will then be perverse to that extent or what is the same thing infantile it

F cz C t b t t Psy h A ly E g lish transl t o by Ernest J es (1916) chap i p 8

way and more general than by emphasizing the attainment of pleasure. We can say that the mental apparatus serves the purpose of mastering and discharging the masses of stimuli and quantities of energy. It is very evident that the sexual instincts pursue the plan that the sexual instincts pursue the aim of gratification from the beginning to the end of their development; throughout they keep up this primary function without alteration. At first the other group, the ego-instincts, do the same, but under the influence of necessity their mistress, they soon learn to replace the pleasure-principle by a modification of it. The task of avoiding pain becomes for them almost equal in importance to that of gaining pleasure; the ego learns that it must inevitably go without immediate satisfaction, postpone gratification, learn to endure a degree of pain, and altogether renounce certain sources of pleasure. Thus trained, the ego becomes "reasonable," is no longer controlled by the pleasure-principle, but follows the REALITY PRINCIPLE, which at bottom also seeks pleasure—although delayed and diminished pleasure, one which is assured by its realization of fact, its relation to reality.

The transition from the pleasure-principle to the reality-principle is one of the most important advances in the development of the ego. We already know that the sexual instincts follow late and unwillingly through this stage; presently we shall learn what the consequences are to man that his sexuality is satisfied with such a slender hold upon external reality. And now in conclusion one more observation relevant in this connection. If the ego in mankind has its evolution like the libido, you will not be surprised to hear that there exist "ego-regressions" too, and will wish to know the part this reversion of the ego to earlier stages in development can play in neurotic disease.

TWENTY THIRD LECTURE

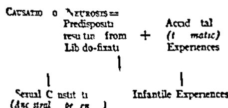
The Paths of Symptom Formation

In the eyes of the general public, the symptoms are the essence of a disease, and to them cure means the removal of the symptoms. In medicine, however, we find it important to differentiate between symptoms and disease, and state that the disappearance of the symptoms is by no means the same as the cure of the disease. The only tangible element of the disease that remains after the removal of the symptoms, however, is the capacity to form new symptoms. Therefore for the moment let us adopt the lay point of view and regard a knowledge of the foundation of the symptoms as equivalent to understanding the disease.

The symptoms—of course we are here dealing with mental (or psychogenic) symptoms, and mental disease—are activities which are detrimental, or at least useless, to life as a whole; the person concerned frequently complains of them as obnoxious to him, or they involve distress and suffering for him. The principal injury they inflict lies in the expense of mental energy they entail, and besides this in the energy needed to combat them. Where the symptoms are extensively developed, these two kinds of effort may exact such a price that the person suffers a very serious impoverishment in available mental energy which consequently disables him for all the important tasks of life. This result depends principally upon the amount of energy taken up in this way; therefore you will see that "illness" is essentially a practical conception. But if you look at the matter from a theoretical point of view and ignore this question of degree, you can very well say that we are all ill, i.e., neurotic; for the conditions required for symptom formation are demonstrable also in normal persons.

Of neurotic symptoms we already know that they are the result of a conflict arising when a new form of satisfaction of libido is sought. The two powers which have entered into opposition meet together again in the symptom and become reconciled by means of the *compromise* contained in symptom formation. That is why the symptom is capable of such resistance; it is sustained from both sides. We also know that one of the two partners to the conflict is the unsatisfied libido, frustrated by reality and now forced to seek other paths to satisfaction. If reality remains inexorable even when the libido is prepared to take another object in place of that denied, the libido will then finally be compelled to resort to regression and to seek satisfaction in one of the organizations it had already surmounted or in one of the objects it had relinquished earlier. The libido is drawn into the path of regression by the fixations it has left behind it at these places in its development.

Now the path of perversion branches off sharply from that of neurosis. If these regressions do not call forth prohibition on the part of the ego, no neurosis results; the libido succeeds in obtaining a real, although not a



libido we must emphasize an aspect which hitherto has received little attention Both of them are at bottom inheritances abbreviated repetitions of the evolution undergone by the whole human race through long drawn out periods and from prehistoric ages In the development of the libido this phylogenetic origin is readily apparent I should suppose Think how in one class of animals the genital apparatus is in closest relation with the mouth in another it is indistinguishable from the excretory mechanism in another it is part of the organs of motility you will find a delightful description of these facts in W Bolsche s valuable book One sees in animals all the various perversions ingrained so to speak in the form taken by their sexual organizations Now the phylogenetic aspect is to some extent obscured in man by the circumstances that what is fundamentally inherited is nevertheless individually acquired anew probably because the same conditions that originally induced its acquisition still prevail and exert their influence upon each individual I would say where they originally created a new response they now stimulate a predisposition Apart from this it is unquestionable that the course of the prescribed development in each individual can be disturbed and altered by current impressions from without But the power which has enforced this development upon mankind and still today maintains its pressure in the same course is known to us it is again the frustration exacted by reality or if we give it its great real name it is *necessity* the struggle for life *αναγχη* Necessity has been a severe task mistress and she has tau ht us a great deal Neurotics are those of her children upon whom this severity has had evil effects but that risk is inevitable in any education Incidentally this view of the struggle for existence as the motive force in evolution need not detract from the significance of *inner evolutionary tendencies* if such are found to exist

Now it is very noteworthy that sexual instincts and self preservative instincts do not behave alike when confronted with the necessity of real life The self preservative instincts and all that hangs together with them are more easily moulded they learn early to conform to necessity and to adapt their development according to the mandates of reality This is comprehensible for they cannot obtain the objects they require by any other means and without these objects the individual must perish The sexual instincts are less easily moulded for in the beginning they do not know any lack of objects Since they are connected parasitically as it were with the other physical functions and at the same time can be auto erotically gratified on their own body they are at first isolated from the educative influence of real necessity and in most people they retain throughout life in some respect or other this character of obstinacy and inaccessibility to influence which we call *unreasonableness* Moreover the educability of a young person as a rule comes to an end when sexual desire breaks out in its final strength Educators know this and act accordingly but perhaps they will yet allow themselves to be influenced by the results of psycho-analysis so that they will transfer the main emphasis in education to the earliest years of childhood, from the suckling period onward The little human being is frequently a finished product in his fourth or fifth year and only gradually reveals in later years what lies buried in him.

To appreciate the full significance of this difference between the two groups of instincts we must digress some distance and include one of those aspects which deserve to be called *economic* we enter here upon one of the most important but unfortunately one of the most obscure territories of psycho analysis We may put the question whether a main purpo e is discernible in the operation of the mental apparatus and our first approach to an answer is that this purpose is directed to the attainment of pleasure It seems that our entire psychical activity is bent upon *procuring pleasure* and *avoiding pain* that it is automatically re ulated by the PLEASURE PRINCIPLE Now of all things in the world we should l ke to know what are the conditions giving rise to pleasure and pain but that is just where we fall short We may only venture to say that pleasure is *in some way* connected with le ening lowering or extinguishing the amount of stimulation present in the mental apparatus and that pain involves a heightening of the latter Consideration of the most intense plea ure of which man is capable the pleasure in the performance of the sexual act leaves little doubt upon this point Since pleasurable proces es of this kind are bound up with the distribution of quantities of mental excitation and energy we term cons derat ons of this kind *economic* ones It appears that we can describe the tasks and performances of the mental apparatus in another

happens, in favour of ancestral experiences or of experien es in adult life but on the co trary they should be particula ly ppreciated They are all the more pregnant with consequences because they occur at a time of uncompl ted de velopment and for this very reason are likely to have a traumatic effect. The work do e by Roux and others on the m chanism of development has shown that a needle pricked into an embryonic c ll ma s undergoing di ision re sults in serious disturbances of the development the same injury to a larva or a full grown animal would be innocuous

The lib do-fixation of an adult which we have ref rred to as represe ting the co stitu tional f ct r in the aet ology of the neuroses ma theref re now be d ided into two further e ements the inherited predisposit on and the predi pos tion acquired n ea ly childhood Since a schem tic mod f presentat on is alwa s ac ceptable t student let us formulate these relations as follows

CAUSATIO O NEUROSIS = Predispositi resu tin from Lib do-fixati + Accid tal (t matic) Experiences

Sexual C nstit ti (Anc stral pe en) | Infantile Experiences

The h red tary sexual constitut on pro ides a great va ety f predisposit ons c o ding as this o that c mpo t mpulse l e in ombinati w th oth rs is peciall tro gly cce tuated. Togethe w th the infa til ex perien th sexual nstitut f rms anothe c mplem tal ers s qu t m lar t th t al ready described as being f rmed out f the predispos tio and d tal experi ces f an adult I ea h series s mila ext me cases re met with, and als simila degree and rela tionships betwee the f tors o c rned It would be appropri te t this po t to con de whethe th m re striking f the tw kinds of lib o-regress on (that which reverts to ea lie stages f sexual organizat n) s t predominantly co dit ed by th h editary const t tional f ct but th an we t thi que tion is best postponed until a wid rang of f rms of eurotic disease can be con dered

Now l t us devote tt ti t th fact that analytic in est gatio sh ws th lib do f n rotics to be attached to the r infant le sexual experiences In this light these experiences seem to be of enormous importa ce in the l ves and illnesses of mankind This importance re mai s und mini hed in so far as the therapeu t c wo k of analysis is concerned but regarded from another poi t of iew it is easy to see

— of The importa ce of the i fan

but only acquired it later by regression You will remember that we d cu sed a s milar al ternati e before in dealing with the Oed pus complex.

To decide this point is again not difficult. The tatement i u doubtedly correct that re gres great augments the cathexis of the infantile experiences with libido—and with that thei pathogenic gnificance but it would be misleading to allow this alone to become de cisi e O h r con derations m t be taken i t account as well. To begin w th, observatio hows n a manner excluding all do bt that n f tile experie ces ha e th ir own import nce wh h s demonstrated already during child hood There are indeed neuroses in ch dren too n the r neuroses the factor of d splace ment backwards in time is neces arily much d minished or quite absent the outbreak of ill ess followin mmediately upo a traumat c xperience The study of infa tile ne roses guards us from many ri ks of misunderstand i the neuroses of adults just as children s dreams gave u the key to comprehens o f the d eam f ad lts Neuro in childre s very c mmon f more mmon than is u u ally upposed It is often ove looked rega d d s a manif st t on of bad beha our au ht ness and ofte subdued by the autho ti s n th nursery but in retrospect it is alwa s easily recognizable It appears most oft n in th form of anxiety hyst ria we shall learn what that means o a ther occas n Wh n a ne os break out in later lif anal sis i vari ably reveals it to be direct continuat n of that fant le n urosis which had pe haps been expressed in a veiled and cip e t form onl s has bee sa d h wev th are cases in whi h the child h nerv u ne s is carried on

normal satisfaction But if the ego which controls not merely consciousness but also the approaches to motor innervation and hence the realization in actuality of mental impulses is not in agreement with these regressions conflict ensues The libido is blocked as it were and must seek an escape by which it can find an outlet for its cathexis (charge of energy) in conformity with the demands of the pleasure principle it must elude eschew the ego The fixations upon the path of development now regressively traversed—fixations against which the ego had previously guarded itself by repressions—offer just such an escape In streaming backward and re *cathecting* these repressed positions the libido withdraws itself from the ego and its laws but it also abandons all the training acquired under the influence of the ego It was docile as long as satisfaction was in sight under the double pressure of external and internal frustration it becomes intractable and harks back to former happier days That is its essential unchangeable character The ideas to which the libido now transfers its cathexis belong to the unconscious system and are subject to the special processes characteristic of that system—namely condensation and displacement Conditions are thus set up which correspond exactly with those of dream formation Just as the latent dream first formed in the unconscious out of the thoughts proper and constituting the fulfilment of an unconscious wish phantasy meets with some (pre)conscious activity which exerts a censorship upon it and permits according to its verdict the formation of a compromise in the manifest dream so the ideas to which the libido is attached (libido representatives) in the unconscious have still to contend with the power of the preconscious ego The opposition against it in the ego follows it as an anti cathexis (counter charge) and forces it to adopt a form of expression by which the opposing forces can at the same time express themselves In this way the symptom then comes into being as a derivative distorted in manifold ways of the unconscious libidinal wish fulfilment as a cleverly chosen ambiguity with two completely contradictory significations In this last point alone is there a difference between dream formation and symptom formation for the preconscious purpose in dream formation is merely to preserve sleep and to allow nothing that would disturb it to penetrate consciousness it does not insist upon confronting the unconscious wish impulse with a sharp prohibiting No on the contrary It can be more tolerant because a sleeping person is in a less dangerous position the condition of sleep is enough in itself to prevent the wish from being realized in actuality

You see that this escape of the libido under the conditions of conflict is rendered possible by the existence of fixations The regressive cathexis (with libido) of these fixations leads to a circumventing of the repressions and to a discharge—or a satisfaction—of the libido in which the conditions of a compromise have nevertheless to be maintained By this detour through the unconscious and the old fixations the libido finally succeeds in attaining to a real satisfaction though the satisfaction is certainly of an exceedingly restricted kind and hardly recognizable as such Let me add two remarks on this outcome First will you notice how closely connected the libido and the unconscious on the one hand and the ego consciousness and reality on the other show themselves to be although there were no such connections between them originally, and secondly let me tell you that all I have said and have still to say on this point concerns the neurosis of hysteria only

Where does the libido find the fixations it needs in order to break through the repressions? In the activities and experiences of infantile sexuality in the component tendencies and the objects of childhood which have been relinquished and abandoned It is to them therefore that the libido turns back The significance of childhood is a double one on the one hand the congenitally determined instinct dispositions are first shown at that time and secondly other instincts are then first awakened and activated by external influences and accidental events experienced In my opinion we are quite justified in laying down this dichotomy That the innate predisposition comes to expression will certainly not be disputed but analytic observation even requires us to assume that purely accidental experiences in childhood are capable of inducing fixations of libido Nor do I see any theoretical difficulty in this Constitutional predispositions are undoubtedly the after effects of the experiences of an earlier ancestry they also have been at one time acquired without such acquired characters there would be no heredity And is it conceivable that the acquisition of characters which will be transmitted further should suddenly cease in the generation which is being observed today? The importance of the infantile experiences should not however be entirely overlooked as so often

sympt ms seem rema kable and inexplicable as a means of lib dinal satisfaction They so en tirely fail to rem d us f all that we are ac customed normally to connect with satisfact on. They are mostly q te independent of an object and thu have gi en up a relation to ex ternal reality We understand this as a co e quence of th rejection of the reality principle and the return to the plea ure prin iple t is also however a et rn to a kind of amplified auto-e otism, the kind which ffered the exual in tinct its first gratificati ns I the place of eff ctin a change in the outer wo ld they set up a change in the body itself that is an in ternal actio instead f a ternal o e an adaptatio instead of an cti ty—from a phy logenetic po nt of ew again a ery s gnificant regress n. into lifelong illness without a break. In a few instances we have been able to analyse a child actually in a condition of neurosis; far more often we have had to be satisfied with the retrospective insight into a childhood neurosis that can be gained through someone who has fallen ill in mature years, a situation in which due corrections and precautions must not be neglected.

In the second place it would certainly be inexplicable that the libido should regress so regularly to the time of childhood if there had been nothing there which could exert an attraction upon it. The fixation upon certain stages of development which we assume, only has meaning if we regard it as attaching to itself a definite amount of libidinal energy. Finally, I may point out that a complemental relationship exists here between the intensity and pathogenic importance of the *infantile* and of the *later* experiences, again a similar relationship to that found in the other two series we have already studied. There are cases in which the whole accent of causation falls on the sexual experiences in childhood, cases in which these impressions undoubtedly had a traumatic effect, nothing more than the average sexual constitution and its immaturity being required to supplement them. Then there are others in which all the accent lies on the later conflicts and the analytic emphasis upon the childhood impressions seems to be the effect of regression alone. There exist, therefore, the two extremes—*inhibited development* and *regression*—and between them every degree of combination of the two factors.

This state of things has a certain interest for those looking to pedagogy for the prevention of neuroses by early intervention in the matter of the child's sexual development. As long as attention is directed mainly to the infantile sexual experiences one would think everything in the way of prophylaxis of later neurosis could be done by ensuring that this development should be retarded and the child secured against this kind of experience. But we know that the conditions causing neurosis are more complicated than this and that they cannot be influenced in a general way by attending to one factor only. Strict supervision in childhood loses value because it is helpless against the constitutional factor; more than this, it is less easy to carry out than specialists in education imagine, and it entails two new risks which are not to be lightly disregarded. It may accomplish too much, in that it favours an exaggerated degree of sexual [illegible] must be expected at puberty. It therefore remains most doubtful how far prophylaxis in childhood can go with advantage, and whether a changed attitude to actuality would not constitute a better point of departure for attempts to forestall the neuroses.

Let us return to consideration of the symptoms. They yield a satisfaction in place of one lacking in reality; they achieve this by means of a regression of the libido to a previous time of life, with which regression is indissolubly connected a reversion to earlier phases in the object choice or in the organization. We learned some time ago that the neurotic is in some way *tied* to a period in his past life; we know now that this period in the past is one in which his libido could attain satisfaction, one in which he was happy. He looks back on his life story seeking some such period and goes on seeking it, even if he must go back to the time when he was a suckling infant to find it according to his recollection or his imagination of it under later influences. In some way the symptom reproduces that early infantile way of satisfaction, disguised though it is by censorship implicit in the conflict, converted as it usually is into a sensation of suffering and mingled with elements drawn from the experiences leading up to the outbreak of the illness. The kind of satisfaction which the symptom brings has much about it which estranges us, quite apart from the fact that the person concerned is unaware of the satisfaction and perceives this that we call satisfaction much more as suffering and complains of it. This transformation belongs to the mental conflict by the pressure of which the symptom had to be formed; what was at one time a satisfaction must today arouse resistance or horror in him. We are familiar with a simple but instructive instance of such a change of feeling: the same child that sucked milk with voracity from its mother's breast often shows some years later a strong dislike of milk which can with difficulty be overcome by training; this dislike is intensified to the point of horror if the milk or any other kind of liquid containing it has a skin formed upon it. It is possible that the skin calls up reverberations of a memory of the mother's breast, once so ardently desired; it is true that the traumatic experience of weaning has intervened meanwhile.

There is still something else which makes the

symptom pern ... a

g t and thus ha e given up a relation to e ternal real ...

a ... r a return to a kind of amplified auto-ero ism, the kind which offered the sexual instinct its first grat ficati ns In the place of effecting a change i the o te wo ld they set up a change in the bod itself that is an in ternal ctio instead of an external o e an adaptation instead f an activ ty—from a phy logenet c point of v ew again a ery s gnificant regres n W hall understand this better when we con ider t in connection with a new fact r yet to be learnt f om among those wh h a ...

... symptom represents something as fulfilled a satisf ct on infantile in charact r but b the utmost condensati n this sati fac tion can be compres ed int a s gle sensat on o in rvation, or by farthest displacement can be wh tled away to a tiny detail out of the en tire libidinal complex. It is no wonde that we often find it difficult to recognise in th symptom th lib dinal satisfaction which we suspect and can always verify in t.

I have indicated that we ha e still t learn of a ew elemen surpri analys f the is fixa ... in the symptoms are made up Now the a toni hing thing is that these scenes of infancy are ot always true In deed in th majority f cases they are untrue and in some cases they are in direct ppo t on to his ori al truth. You will ee that this discovery is m re lik ly than any othe t discredit eith r the analysis which lead t su h results o th pati t upon who t timony the anal is and c mprehens on f the neu oses a a whol is b lt up. There is bes des this stil something utt rly bew ld n abo t it If the infantile experiences b ought to light by th a al were n every case real we sh ld have the feeling that we e on firm ground if they were in ariably fals fied and f und to be inven ions a d phanta es of the patient s we should have to forsake this insecure foothold and save ourselves some other way B t it is neither one thing nor the other for what we find is that the childhood-experiences recon structed or recollected i analysis are on some occasions und niably false, while others are just as certainly quite true and that in most cases truth and falsehood are mixed up So the symptoms are thus at one minute reprod ctions of experiences which actually took place and which one can credit with an influence on the fixation of the libido and at the next a reproduction of phantasies of the patient s to which of course t is difficult to ascribe any aetiologi cal significance. It s hard to find one s way here. We may perhaps find our first clue in a disco ery of a similar kind, namely that the meagre childish recollections which people have always lo g before anal s s consciously pre rved can be falsified in the same way or at least can contain a generous admixture of truth and falsehood evidence of error in th m is nea ly always plainly visible and so we have at least th reassurance that not the analy is, but th patient in s me way must bear the re sponsibility for this unexpected disappo ntment.

After a l ttle reflect on we can easily under stand what it is that is so bewildering in this matte It is the depreciat on f reality the neg lect f the difference between reality and phan tasy w are tempted to be offended with the patient for t kin up our time with in e ted stories According to our way of thinking heaven and earth are n t farthe apart than ficti n f om reality a d we value the two quite differently The pat ent h mself incidentally t ke the same att tud when he is thinking normall When he brings forward the material that lead us to the wished f r situations (which underli th symptoms and are formed upon the childhood experiences) we are certainly in doubt t first whether w have t deal w th reality o with phanta es Decis n on this po t be m s pos b e late by means f er tai indications and we are th n conf onted w th th task of making this result known to th pati nt. This is neve ccomplished without difficul y If we t ll him at the utset that he is n w about to bring t l ht the phantas es in whi h h ha h o ded the history of his child hood just as e ery race weaves myth bout ts forgotten early history we bserve t our dissatisf ction that hi interest in pursuing the ubject furthe suddenly declines—he also wishes to find out facts and despises what is

called *imagination* But if we leave him to be lieve until this part of the work has been car ried throu_h that we are investigatin" the real events of his early years we run the risk of being charged with the mistake later and of being laughed at for our apparent gullibility It takes him a long time to understand the proposal that phantasy and reality are to be treated alike and that it is to begin with of no account whether the childhood experiences un der consideration belong to the one class or to the other And yet this is obviously the only correct attitude towards these products of his mind They have indeed also a kind of reality it is a fact that the patient has created these phantasies and for the neurosis this fact is *hardly less important than the other—if he had* really experienced what they contain In con trast to *material* reality these phantasies pos sess *psychical* reality and we gradually come to understand that *in the world of neurosis* PSY CHICAL REALITY *is the determining factor*

Amon" the occurrences which continually recur in the story of a neurotic s childhood and eem hardly ever absent are some of particular significance which I therefore consider worthy of special attention As models of this type I will enumerate observation of parental inter course seduction by an adult and the threat of castration It would be a great mistake to sup pose that they never occur in reality on the contrary they are often confirmed beyond doubt by the testimony of older relatives Thus for example it is not at all uncommon for a little boy who is be_innin to play with his penis and has not yet learnt that he must conceal such activities to be threatened by parents or nurses that his member or his of fending hand will be cut off Parents will often admit the fact on being questioned since they imagine that such intimidation was the right course to take many people have a clear con scious recollection of this threat especially if it took place in later childhood If the mother or some other woman makes the threat she usually shifts the execution of it to someone else in dicating that the father or the doctor will per form the deed In the famous *Struwelpeter* by the Frankfort physician for children Hoff mann which owes its popularity precisely to his undertanding of the sexual and other com plexes of children you will find the castration idea modified and replaced by cutting off the thumbs as a punishment for stubborn sucking of them It is however highly improbable that the threat of castration has been delivered as often as would appear from the analysis of a neurotic We are content to understand that the child concocts a threat of this kind out of its knowled e that auto-erotic satisfactions are forbidden on the basis of hints and allusions and influenced by the impression received on discoverin_ the female genital organ Similarly it is not at all impossible that a small child credited as he is with no understanding and no memory may be witness of the sexual act on the part of his parents or other adults in other families besides those of the proletariat and there is reason to think that the child can *subsequently* understand the impression re ceived and react to it But when this act of in tercourse is described with minute details which can hardly have been observed or when it ap pears as it most frequently does to have been performed from behind *more ferarum* there can be little doubt that this phantasy has grown out of the observation of copulating animals (do s) and that its motive force lies in the un satisfied skoptophilia (gazing impulse) of the child during puberty The greatest feat achieved by this kind of phantasy is that of observing parental intercourse while still unborn in the mother s womb

The phantasy of seduction has special inter est because only too often it is no phantasy but a real remembrance fortunately however it is still not as often real as it seemed at first from the results of analysis Seduction by chil dren of the same age or older is more frequent than by adults and when girls who brin for ward this event in the story of their childhood fairly regularly introduce the father as the seducer neither the phantastic character of this accusation nor the motive actuating it can be doubted When no seduction has occurred the phantasy is usually employed to cover the child hood period of auto erotic exual activity the child evades feelin s of shame about onanism by retrospectively attributing in phantasy a desired object to the earliest period Do not suppose however that sexual misu e of chil dren by the nearest male relatives is entirely derived from the world of phantasy most analysts will have treated cases in which such occurrences actually took place and could be established beyond doubt only even then they belonged to later years of childhood and had been transposed to an earlier time

All this eems to lead to but one impression that childhood experiences of this kind are in some way necessarily requ red by the neurosis

I th m f imal —E

that they belong to its unvarying inventory. If they can be found in real events, well and good; but if reality has not supplied them they will be evolved out of hints and elaborated by phantasy ... we ... on ... ally ... plays the greater part in these experiences. Here again is one of those complemental series so often referred to already; it is certainly the strangest of all those we have encountered. Whence comes the necessity for these phantasies and the material for them? There can be no doubt about the instinctual sources; but how is it to be explained that the same phantasies are always formed with the same content? I have an answer to this which I know will seem to you very daring. I believe that these *primal phantasies* (as I should like to name these and certainly some others also) are a phylogenetic possession. In them the individual, wherever his own experience has become insufficient, stretches out beyond it to the experience of past ages. It seems to me quite possible that all that today is narrated in analysis in the form of phantasy, seduction in childhood, stimulation of sexual excitement upon observation of parental coitus, the threat of castration—or rather castration itself—was in prehistoric periods of the human family a reality; and that the child in its phantasy simply fills out the gaps in its true individual experiences with true prehistoric experiences. We have again and again been led to suspect that more knowledge of the primordial forms of human development is stored up for us in the psychology of the neuroses than in any other field we may explore.

Now these things that we have been discussing require us to consider more closely the origin and meaning of that mental activity called *phantasy-making*. In general, as you know, it enjoys high esteem, although its place in mental life has not been clearly understood. I may tell you as much as this about it. You know that the ego in man is gradually trained by the influence of external necessity to appreciate reality and to pursue the reality principle, and that in so doing it must renounce temporarily or permanently various of the objects and aims—not only sexual—of its desire for pleasure. But renunciation of pleasure has always been very hard to man; he cannot accomplish it without some kind of compensation. Accordingly he has evolved for himself a mental activity in which all these relinquished sources of pleasure and abandoned paths of gratification are permitted to continue their existence, a form of existence in which they are free from the demands of reality and from what we call the exercise of *testing reality*. Every longing is soon transformed into the idea of its fulfilment; there is no doubt that dwelling upon a wish-fulfilment in phantasy brings satisfaction, although the knowledge that it is not reality remains thereby unobscured. In phantasy, therefore, man can continue to enjoy a freedom from the grip of the external world, one which he has long relinquished in actuality. He has contrived to be alternately a pleasure-seeking animal and a reasonable being; for the meagre satisfaction that he can extract from reality leaves him starving. "There is no doing without accessory constructions," said Fontane. The creation of the mental domain of phantasy has a complete counterpart in the establishment of reservations and nature parks in places where the inroads of agriculture, traffic, or industry threaten to change the original face of the earth rapidly into something unrecognizable. The *reservation* is to maintain the old condition of things which has been regretfully sacrificed to necessity everywhere else; there everything may grow and spread as it pleases, including what is useless and even what is harmful. The mental realm of phantasy is also such a reservation reclaimed from the encroaches of the reality-principle.

The best known productions of phantasy have already been met by us; they are called *day-dreams*, and are imaginary gratifications of ambitious, grandiose, erotic wishes, dilating the ... which is independent of reality's sanction. We know that these day-dreams are the kernels and models of night-dreams; fundamentally the night-dream is nothing but a day-dream distorted by the nocturnal form of mental activity and made possible by the nocturnal freedom of instinctual excitations. We are already familiar with the idea that a day-dream is not necessarily conscious, that unconscious day-dreams also exist; such unconscious day-dreams are therefore just as much the source of night-dreams as of neurotic symptoms.

The significance of phantasy for symptom-formation will become clear to you in what follows. We said that under frustration, the libido regressively invests the positions it had

left but to which nevertheless some portions of its energy had remained attached We shall not retract or correct this statement but we shall have to interpolate a connecting link in it How does the libido find its way b [illegible] these fi [illegible]

[illegible] in every sense they or their derivatives are still retained to some degree of intensity in the conceptions of phantasy The libido has only to withdraw on to the phantasies in order to find the way open to it back to all the repressed fixations These phantasies had enjoyed a certain sort of toleration no conflict between them and the ego had developed however sharp an oppo [illegible] bet [illegible] pr [illegible] tu [illegible] by the return of the libido stream on to the phantasies By this accession the cathexis of the phantasies with energy becomes so much augmented that they become assertive and begin to press towards realization then however conflict between them and the ego becomes unavoidable Although previously they were preconscious or conscious now they are subject to repression from the side of the ego and are exposed to the attraction exerted from the side of the unconscious The libido travels from the phantasies now unconscious to their ources in the unconscious —back to its own fixation points again

The return of the libido on to phantasy is an intermediate step on the way to symptom formation which well deserves a special designation C G Jung has coined for it the very appropriate name of INTROVERSION but inappropriately he uses it also to describe other things We will adhere to the position that *introversion* describes the deflection of the libido away from the possibilities of real satisfaction and its excessive accumulation upon phantasies previously tolerated as harmless An introverted person is not yet neurotic but he is in an unstable condition the next disturbance of the shifting forces will cause symptoms to develop unless he can yet find other outlets for his pent up libido The unreal character of neurotic satisfaction and the disregard of the difference between phantasy and reality are already determined by the arrest at this stage of introversion

You will doubtless have noticed that in these last remarks I have introduced a new factor into the concatenation of the aetiological chain —namely the *quantity* the magnitude of the energies concerned we must always take this factor into account as well A purely qualitative analysis of the aetiological conditions does not suffice or to put it in another way a purely *dynamic* conception of these processes is insufficient the *economic* aspect is also required We have to realize that the conflict between the two forces in opposition does not break out until a certain intensity in the degree of investment is reached even though the substantive conditions have long been in existence In the same way the pathogenic significance of the constitutional factor is determined by the preponderance of one of the component instincts in *excess* over another in the disposition it is even possible to conceive disposition as qualitatively the same in all men and only differentiated by this quantitative factor No less important is this quantitative factor for the capacity to withstand neurotic illness it depends upon the *amount* of undischarged libido that a person can hold freely suspended and upon *how large* a portion of it he can deflect from the sexual to a nonsexual goal in sublimation The final aim of mental activity which can be qualitatively described as a striving towards pleasure and avoidance of pain is represented economically in the task of mastering the distribution of the quantities of excitation (stimulus masses) present in the mental apparatus and in preventing the accumulation of them which gives rise to pain

I set out to tell you as much as this about symptom formation in the neuroses Yes but I must not neglect to mention once more that everything said today relates only to symptom formation in hysteria Even the obsessional neurosis shows great differences although the essentials are the same The *counter-charges* from the ego against the demands made by instincts for satisfaction mentioned already in connection with hysteria are more strongly marked in the obsessional neurosis and govern the clinical picture in the form of what we call *reaction formations* Similar and more extensive deviations still are found in the other neuroses in which field researches into the mechanisms of symptom formation are not yet complete in any direction

Before you leave today I should like to direct your attention for a moment to a side of phantasy life of very general interest There is in fact a path from phantasy back again to reality and that is—art The artist has also an introverted disposition and has not far to go to become neurotic He is one who is urged

en by instinctual needs which are too clamor ous he longs to attain to honour power r ches fame and the lov of women but he lacks the means of achie g these grat ficat ons. So like any othe with an unsatisfied lo gin he turns away from reality and tran fers all h s inter e t, and all his lib do too on to the creat on of his w hes in the lif of phantasy from which the way might re dily le d to neurosis There must be many factors n combination to pre vent this be omi th whole outcome of his development it i well known how often ar tists in particular suffer f om part al inhib tion of their capacities throu h euro is Probably their co stit tion is e d wed with powerful capac ty f ublimation and w th a certain flexib tv in the repr ss o s det rmin ng the

tirely subject to the author s will it comes out in its own way and one can but wonder afterwards why it happened so and not otherwise

One of the reasons probably is that my theme an introduction to psycho analysis no longer covers this section dealing with the subject of the neuroses The introduction to psycho analysis lies in the study of errors and of dreams the theory of neurosis is psycho analysis itself I do not think that in such a short time I could have given you any knowledge of the material contained in the theory of the neuroses except in this very concentrated form It was a matter of presenting to you in their proper context the sense and meaning of symptoms together with the external and internal conditions and mechanisms of symptom formation This I attempted to do it is more or less the core of what psycho analysis is able to offer today In conjunction with it there was much to be said about the libido and its development and something about that of the ego You were already prepared by the preliminary lectures for the main principles of our method and for the broad aspects involved in the conceptions of the unconscious and of repression (resistance) In one of the following lectures you will learn at what point the work of psycho analysis finds its organic continuation So far I have not concealed from you that all our results proceed from the study of one single group only of nervous disorders—namely the transference neuroses and even so I have traced out the mechanism of symptom formation only in the hysterical neurosis Though you will probably have gained no very thorough knowledge and have not retained every detail yet I hope that you have acquired a general idea of the means with which psycho analysis works the problems it has to deal with and the results it has to offer

I have ascribed to you a wish that I had begun the subject of the neuroses with a description of the neurotic s behaviour and of the ways in which he suffers from his disorder protects himself against it and adapts himself to it This is certainly a very interesting subject well worth studying and not difficult to treat nevertheless there are reasons against beginning with this aspect The danger is that the unconscious will be overlooked the great impor

liable and impartial authority The ego is after all the force which denies the existence of the unconscious and has subjected it to repressions how then can we trust its good faith where the unconscious is concerned? That which has been repressed consists first and foremost of the repudiated claims of the sexuality it is perfectly self evident that we shall never learn their extent and their significance from the ego s view of the matter As soon as the nature of repression begins to dawn upon us we are advised not to allow one of the two contending parties and certainly not the victorious one to be judged in the dispute We are forewarned against being misled by what the ego tells us According to its evidence it would appear to have been the active force throughout so that the symptoms arise by its will and agency we know that to a large extent it has played a passive part a fact which it then endeavours to conceal and to gloss over It is true that it cannot always keep up this pretence—in the symptoms of the obsessional neurosis it has to confess to being confronted by something alien which it must strenuously resist

It is certainly plain sailin enou h for anyone who does not heed these warnings against taking the falsifications of the ego at their face value he will escape all the opposition which psycho analysis has to encounter in accentuating the unconscious sexuality and the passivity of the ego He can agree with Alfred Adler that the *nervous character* is the cause of the neurosis instead of the result but he will not be in a position to account for a single detail of symptom formation or a single dream.

You will ask May it not be possible to do justice to the part played by the ego in nervousness and in symptom formation without absolutely glaring neglect of the other factors discovered by psycho analysis? I reply Certainly it must be possible and some time or other it will be done but the work which lies at hand for psycho analysis is not suited for a beginning at this end One can no doubt predict the point at which this task also will be included There are neuroses called by us the *narcissistic* neuroses in which the ego is far more deeply involved than in those we have studied analytic investigation of these disorders will enable us to estimate impartially and reliably the share taken by the ego in neurotic disease

One of the relations the ego bears to its neurosis is however so conspicuous that it was quite appreciable from the beginning It never seems to be absent but it is most clearly discernible in a form of disorder which we are far

from understanding the traumatic neurosis. You must know that in the causation and mechanism of all the various different forms of neurosis the same factors are found at work over and over again, only that in one type this factor and in another type that factor is of greatest significance in symptom formation. It is just the same as with the personnel of a theatrical company where every member plays a special type of part—hero, confidant, villain, etc. each of them will choose a different piece for his own benefit-performance. Hence the phantasies which are transformed into the symptoms are nowhere so manifest as in hysteria; the counter-charges (anti-cathexes) or reaction-formations of the ego dominate the picture in the obsessional neurosis; the mechanism which in dreams we called *secondary elaboration* is the prominent feature in the delusions of paranoia, and so on.

In the *traumatic neuroses*, especially in those arising from the terrors of war, we are particularly impressed by a self-seeking, egoistic motive, straining towards protection and self-interest; this alone perhaps could not produce the disease, but it gives its support to the latter and maintains it once it has been formed. This tendency aims at protecting the ego from the dangers which led by their imminence to the outbreak of illness; nor does it permit of recovery until a repetition of the dangers appears to be no longer possible, or until some gain in compensation for the danger undergone has been received.

The ego takes a similar interest in the origin and maintenance of all the other forms of neurosis; we have said already that the symptom is supported by the ego because one side of it offers a satisfaction to the repressing ego-tendency. More than this, a solution of the conflict by a symptom formation is the most convenient one, most in accordance with the pleasure-principle; for it undoubtedly spares the ego a severe and painful piece of internal labour. There are indeed cases in which the physician himself must admit that the solution of a conflict by a neurosis is the one most harmless and most tolerable socially. Do not be astonished to hear then that the physician himself occasionally takes sides with the illness which he is attacking. It is not for him to confine himself in all situations in life to the part of fanatic about health; he knows that there is other misery in the world besides neurotic misery—real unavoidable suffering—that necessity may even demand of a man that he sacrifice his health to it, and he learns that such suffering in one individual may often avert incalculable hardship for many others. Therefore although it may be said of every neurotic that he has taken *flight into illness* it must be admitted that in many cases this flight is fully justified, and the physician who has perceived this state of things will silently and considerately retire.

But let us continue our discussion without regard to these exceptional cases. In the ordinary way it is apparent that by flight into neurosis the ego gains a certain internal *advantage through illness* as we call it; under certain conditions a tangible external advantage more or less valuable in reality may be combined with this. To take the commonest case of this kind: a woman who is brutally treated and mercilessly exploited by her husband fairly regularly takes refuge in a neurosis, if her disposition admits of it. This will happen if she is too cowardly or too conventional to console herself secretly with another man, if she is not strong enough to defy all external reasons against it and separate from her husband, if she has no prospect of being able to maintain herself or of finding a better husband, and last of all, if she is still strongly attached sexually to this brutal man. Her illness becomes her weapon in the struggle against him, one that she can use for her protection or misuse for purposes of revenge. She can complain of her illness, though she probably dare not complain of her marriage; her doctor is her ally; the husband who is otherwise so ruthless is required to spare her, to spend money on her, to grant her absence from home and thus some freedom from marital oppression. Whenever this external or *accidental* advantage through illness is at all pronounced, and no substitute for it can be found in reality, you need not look forward very hopefully to influencing the neurosis by your therapy.

You will now say that what I have just told you about the *advantage through illness* is all in favour of the view I have rejected, namely that the ego itself desires the neurosis and creates it. But just a moment! Perhaps it means merely this: that the ego is pleased to accept the neurosis which it is in any case unable to prevent, and that if there is anything at all to be made out of it it makes the best of it. This is only one side of the matter. In so far as there is advantage in it the ego is quite happy to be on good terms with the neurosis; but there are also disadvantages to be considered. As a

tirely subject to the author s will it comes out in its own way and one can but wonder afterwards why it happened so and not otherwise

One of the reasons probably is that my theme an introduction to psycho analysis no longer covers this section dealing with the subject of the neuroses The introduction to psycho analysis lies in the study of errors and of dreams the theory of neurosis is psycho analysis itself I do not think that in such a short time I could have given you any knowledge of the material contained in the theory of the neuroses except in this very concentrated form It was a matter of presenting to you in their proper context the sense and meaning of symptoms together with the external and internal conditions and mechanisms of symptom formation This I attempted to do it is more or less the core of what psycho analysis is able to offer today In conjunction with it there was much to be said about the libido and its development and something about that of the ego You were already prepared by the preliminary lectures for the main principles of our method and for the broad aspects involved in the conceptions of the unconscious and of repression (resistance) In one of the following lectures you will learn at what point the work of psycho analysis finds its organic continuation So far I have not concealed from you that all our results proceed from the study of one single group only of nervous disorders—namely the transference neuroses and even so I have traced out the mechanism of symptom formation only in the hysterical neurosis Though you will probably have gained no very thorough knowledge and have not retained every detail yet I hope that you have acquired a general idea of the means with which psycho analysis works the problems it has to deal with and the results it has to offer

us of the obsessional neurosis it has to confess to being confronted by something alien which it must strenuously resist

It is certainly plain sailing enough for any one who does not heed these warnings against taking the falsifications of the ego at their face value he will escape all the opposition which psycho analysis has to encounter in accentuating the unconscious sexuality and the passivity of the ego He can agree with Alfred Adler that the *nervous cha acter* is the cau e of the neurosis instead of the result but he will not be in a position to account for a single detail of symptom formation or a single dream

You will ask May it not be possible to do justice to the part played by the ego in nervousness and in symptom formation without absolutely glaring neglect of the other factors discovered by psycho analysis? I reply Certainly it must be possible and some time or other it will be done but the work which lies at hand for psycho analysis is not suited for a beginning at this end One can no doubt predict the point at which this task also will be included There are neuroses called by us the *narcissistic* neuroses in which the e o is far more deeply involved than in those we have studied analytic investigation of these disorders will enable us to estimate impartially and reliably the share taken by the ego in neurotic disease

One of the relations the ego bears to its neurosis is however so conspicuous that it was quite appreciable from the beginning It never seems to be absent but it is most clearly discernible in a form of disorder which we are far

still had similar material for investigation. I noticed often enough that a man who contented himself with some kind of incomplete sexual satisfaction, e.g. with manual masturbation would suffer from a definite type of actual neurosis and that this neurosis would promptly give way to another form if he adopted some other equally unsatisfactory form of sexual life. I was then in a position to infer the change in his mode of sexual life from the alteration in the patient's condition and I learnt to abide stubbornly by my conclusions until I had overcome the prevarications of my patients and had compelled them to give me confirmation. It is true that they then thought it advisable to seek other physicians who would not take so much interest in their sexual life.

It did not escape me at that time either that sexuality was not always indicated as the cause of a neurosis. One person certainly would fall ill because of some injurious sexual condition but another because he had lost his fortune or recently sustained a severe organic illness. The explanation of these variations was revealed later when insight was obtained into the interrelationships suspected between the ego and the libido, and the further this subject was explored the more satisfactory became our insight. A person only falls ill of a neurosis when the ego loses its capacity to deal in some way or other with the libido. The stronger the ego the more easily can it accomplish this task; every weakening of the ego from whatever cause must have the same effect as an increase in the demands of the libido, that is, make a neurosis possible. There are yet other and more intimate relations between the ego and the libido which I shall not go into now as we have not yet come to them in the course of our discussions. The most essential and most instructive point for us is that the fund of energy supporting the symptoms of a neurosis in every case and regardless of the circumstances inducing their outbreak, is provided by the libido which is thus put to abnormal use.

Now I must point out to you the decisive difference between the symptoms of the actual neuroses and those of the psychoneuroses with the first group of which (the transference neuroses) we have hitherto been so much occupied. In both the actual neuroses and the psychoneuroses the symptoms proceed from the libido, that is they are abnormal ways of using it, substitutes for satisfaction of it. But the symptoms of an actual neurosis—headache, sensation of pain, an irritable condition of some organ, the weakening or inhibition of some function—have no meaning, no significance in the mind. Not merely are they manifested principally in the body, as also happens for instance with hysterical symptoms, but they are in themselves purely and simply physical processes; they arise without any of the complicated mental mechanisms we have been learning about. They really are therefore what psychoneurotic symptoms were for so long held to be. But then, how can they be expressions of the libido which we have come to know as a force at work in the mind? Now really the answer to that is very simple. Let me resurrect one of the very first objections ever made against psycho-analysis. It was said that the theories were an attempt to account for neurotic symptoms by psychology alone and that the outlook was consequently hopeless since no illness could ever be accounted for by psychological theories. These critics were pleased to forget that the sexual function is not a purely mental thing any more than it is merely a physical thing. It affects bodily life as well as mental life. Having learnt that the symptoms of the psychoneuroses express the mental consequences of some disturbance in this function, we shall not be surprised to find that the actual neuroses represent the direct somatic consequences of sexual disturbances.

Clinical medicine gives us a useful hint (recognized by many different investigators) towards comprehension of the actual neuroses. In the details of their symptomatology and also in the peculiarity by which all the bodily systems and functions are affected together they exhibit an unmistakable similarity with pathological conditions resulting from the chronic effect or the sudden removal of foreign toxins—with states of intoxication or of abstinence. The two groups of afflictions are brought still closer together by comparison with conditions like Basedow's disease¹ that have also been found to result from poisoning, not however from poisons derived externally but from such as arise in the internal metabolism. In my opinion these analogies necessitate our regarding the neuroses as the effects of disturbances in the sexual metabolism, due either to more of these sexual toxins being produced than the person can dispose of, or else to internal and even mental conditions which interfere with the proper disposal of these substances. Assumptions of this kind about the nature of sexual desire have found acceptance in the mind of

¹ I.e. Graves' disease, exophthalmic goitre.—Tr.

rule it is soon apparent that by accepting a neurosis the ego has made a bad bargain It has paid too heavily for the solution of the conflict the sufferings entailed by the symptoms are perhaps as bad as those of the conflict they replace and they may quite probably be very much worse The ego wishes to be rid of the pain of the symptoms but not give up its advantage through illness and that is just what it cannot succeed in doing It appears therefore that the ego was not quite so actively concerned in the matter throughout as it had thought and we will keep this well in mind

If as physicians you have much to do with neurotics you will soon cease to expect that those who complain most bitterly of their illness will be most ready to accept your help and make least difficulty—quite the contrary You will at all events easily understand that everything which contributes to the advantage through illness reinforces the resistance arising from the repressions and increases the therapeutic difficulties And there is yet another kind of advantage through illness one which supervenes later than that born with the symptom so to speak When such a mental organization as the disea e has persisted for a considerable time it seems finally to acquire the character of an independent entity it displays something like a self preservative instinct it forms a kind of pact a *modus vivendi* with the other forces in mental life even with those fundamentally hostile to it and opportunities can hardly fail to arise in which it once more manifests itself as useful and expedient thus acquiring a *secondary function* which again strengthens its position Instead of taking an example from pathology let us consider a striking illustration in everyday life A capable working man earning his livin is crippled by an accident in the course of his employment he can work no more but he gets a small periodical dole in compensation and learns how to exploit his mutilation as a beggar His new life although so inferior neverthele s

uch destroyed
his disability
of his means

ot subsistence for the question would arise whether he would still be capable of resuming his former work When a secondary exploitation of the illness such as this is formed in a neurosis we can range it alongside the first and call it a *secondary advantage th ough illness*

I should like to advise you in a general way not to underestimate the practical importance of the advantage through illness and yet not to be too much impres ed by its theoretical si nificance Apart from the exceptions previously recognized this factor always remind one of the illustrations of Intelli ence in Animals by Oberlander in *Fliegende Blatter* An Arab is riding a camel along a narrow path cut in the side of a steep mountain At a turn in the path he suddenly finds himself confronted by a lion ready to spring at him There is no escape on one side the abyss on the other the sheer wall retreat and fli ht are impossible he gives himself up for lost Not so the camel He takes one leap with his rider into the abyss—and the lion is left a pectator The remedies provided by neurosis avail the patient no better as a rule perhaps because the solution of the conflict by a symptom formation is after all an automatic process which may show itself inadequate to meet the demands of life and involves man in a renunciation of his best and highest powers The more honourable choice if there be a choice is to go down in fair fight with destiny

I still owe you a further explanation of my motive in not taking ordinary nervousness as my starting point Perhaps you think I avoided doing so because it would have been more difficult to bring in evidence of the sexual origin of the neuroses in that way but in this you would be mistaken In the transference neuroses the symptoms have to be submitted to interpretation before we arrive at this but in the ordinary forms of what are called the ACTUAL NEUROSES the aetiolo ical significance of the sexual life is a crudely obvious fact which courts notice I became aware of it more than twenty years ago as one day I began to wonder why when we examine nervous patients we so invariably exclude from consideration all matters concerning their sexual life Investigations on this point led to the sacrifice of my popularity with my patients but in a very short time my efforts had brought me to this conclusion that no neurosis—actual neurosis I meant—is present where sexual life is normal It is true that this statement ignores the individual differences in people rather too much and it also suffers from the indefinite connotation inseparable from the word *normal* but as a broad outline it has retained its value to this day At that time I got so far as to be able to establish particular connections between certain forms of nervousness and certain injurious sexual conditions I do not doubt that I could repeat these observations today if I

hypochondria and forms of a neurosis which we shall deal with later on, namely paraphrenia (dementia praecox and paranoia). As an example, let us take an hysterical headache or backache. Analysis shows that by means of condensation and displacement it has become a substitutive satisfaction for a whole series of libidinal phantasies or memories. At one time, however, this pain was real, a direct symptom of a sexual toxin, the bodily expression of a sexual excitation. We do not by any means maintain that all hysterical symptoms have a nucleus of this kind, but it remains true that this very often is so, and that all effects (whether normal or pathological) of the libido on upon the body are especially adapted to serve the purposes of hysterical symptom-formation. They play the part of the grain of sand which the oyster envelops in mother-of-pearl. The temporary signs of sexual excitation accompanying the sexual act serve the psychoneurosis in the same way as the most suitable and convenient material for symptom-formation.

There is a similar process of special diagnostic and therapeutic interest. In persons who are disposed to be neurotic without having yet developed a neurosis on a grand scale, some morbid organic condition—perhaps an inflammation, or an injury—very commonly sets the work of symptom-formation in motion, so that the latter process swiftly seizes upon the symptom supplied by reality and uses it to represent those unconscious phantasies that have only been lying in wait for some means of expression. In such a case the physician will try first one therapy and then the other; he will either endeavour to abolish the organic foundation on which the symptom rests, without troubling about the clamorous neurotic elaboration, or he will attack the neurosis which has opportunely been brought to birth, while leaving on one side the organic stimulus which evoked it. Sometimes one and sometimes the other procedure will be found justified by success; no general rules can be prescribed for mixed cases of this kind.

TWENTY-FIFTH LECTURE

ANXIETY

You will certainly have judged the information that I gave you in the last lecture about ordinary nervousness as the most fragmentary and most inadequate of all my accounts. I know that it was, and I expect that nothing surprised you more than that I made no mention of the anxiety which most nervous people complain of and themselves describe as their most terrible burden. Anxiety or dread can really develop tremendous intensity and in consequence be the cause of the maddest precautions. But in this matter at least I wished not to cut you short; on the contrary, I had determined to put the problem of nervous anxiety to you as clearly as possible and to discuss it at some length.

Anxiety (or *dread*) itself needs no description; everyone has personally experienced this sensation, or to speak more correctly this affective condition at some time or other. But in my opinion not enough serious consideration has been given to the question why nervous persons in particular suffer from anxiety so much more intensely and so much more altogether than others. Perhaps it has been taken for granted that they should; indeed, the words *nervous* and *anxious* are used interchangeably as if they meant the same thing. This is not justifiable, however; there are anxious people who are otherwise not in any way nervous and there are besides neurotics with numerous symptoms who exhibit no tendency to dread.

However this may be, one thing is certain, that the problem of anxiety is a nodal point, linking up all kinds of most important questions; a riddle of which the solution must cast a flood of light upon our whole mental life. I do not claim that I can give you a complete solution, but you will certainly expect psycho-analysis to have attacked this problem too in a different manner from that adopted by academic medicine. Interest there centres upon the anatomical processes by which the anxiety condition comes about. We learn that the medulla oblongata is stimulated, and the patient is told that he is suffering from a neurosis in the vagal nerve. The medulla oblongata is a wondrous and beauteous object. I well remember how much time and labour I devoted to the study of it years ago. But today I must say I know of nothing less important for the psychological comprehension of anxiety than knowledge of the nerve-paths by which the excitations travel.

One may consider anxiety for a long time without giving a thought to nervousness. You will understand me at once when I describe this form of anxiety as OBJECTIVE ANXIETY in contrast to neurotic anxiety. Now real anxiety or dread appears to us a very natural and rational thing; we should call it a reaction

the people since the beginning of time love is called an *intoxication* it can be induced by potions —in these ideas the agency at work is to some extent projected on to the outer world We find occasion at this point to remember the erotogenic zones
upon
arise
the su *metabolism* or the *chemistry of sexuality* is an empty chapter we know nothing about it and cannot even determine whether to assume two kinds of sexual substances to be called *male* and *female* or to content ourselves with *one* sexual toxin as the agent of the stimuli effected by the libido The edifice of psycho analytic doctrine which we have erected is in reality but a superstructure which will have to be set on its or anic foundation at some time or other but this foundation is still unknown to us

As a science psycho analysis is characterized by the methods with which it works not by the subject matter with which it deals These methods can be applied without violating their essential nature to the history of civilization to the science of relimon and to mytholo y as well as to the study of the neuroses Psycho analysis aims at and achieves nothing more than the discovery of the unconscious in mental life The problems of the actual neuroses in which the symptoms probably arise through direct toxic injury offer no point of attack for psycho analysis it can supply little towards elucidation of them and must leave this task to biological and medical research Now perhaps you understand better why I chose this arrangement of my material If I had intended an *Introduction to the Study of the Neuroses* it would undoubtedly have been correct to begin with the simple forms of (actual) neuroses and proceed from them to the more complicated psychical disorders resulting from disturbances of the libido I should have had to collect from various quarters what we know or think we know about the former and about the latter psycho analysis would have been introduced as the most important technical means of obtaining insight into these conditions An *Introduction to Psycl o Analysis* was what I had undertaken and announced however I thought it more important to give you an idea of psycho analysis than to teach you something about the neuroses and therefore the actual neuroses which yield nothing toward the study of psycho analysis could not suitably be put in the foreground I think too that my choice was the wiser for you since the radical axioms and far reaching connections of psycho analysis make it worthy of every educated person s interest the theory of the neuroses however is a chapter of medicine like any other

However you are justified in expecting that we should take some interest in the actual neuroses their close clinical connection with the psycho neuroses even ne

ypocnondria Even this classification has been disputed the terms are certainly all in use but their connotation is vague and unsettled There are some medical men who are opposed to all discrimination in the confusing world of neurotic manifestations who object to any distinguishing of clinical entities or types of disease and do not even reco nize the difference between actual neuro es and psychoneuroses in my opinion they go too far and the direction they have cho en does not lead to progre s The three kinds of neurosis named above are occasionally found in a pure form more frequently it is true they are combined with one another and with a psychoneurotic affection This fact need not make us abandon the distinctions between them Think of the difference between the science of minerals and that of ores in mineralogy the minerals are classified individually in part no doubt because they are frequently found as crystals sharply differentiated from their surroundings the ores consist of mixtures of minerals which have indeed coalesced not accidentally but according to the conditions at their formation In the theory of the neuroses we still understand too little of the process of their development to formulate anything similar to our knowled e of ores but we are certainly working in the right direction in first isolating from the mass the recognizable clinical element which are comparable to the individual minerals

A noteworthy connection between the symptoms of the actual neuroses and the psychoneuroses adds a valuable contribution to our knowledge of symptom formation in the latter the symptom of the actual neurosis is frequently the nucleus and incipient stage of the psychoneurotic symptom A connection of this kind is most clearly observable between neurasthenia and the transference neurosis known as conversion hysteria between the anxiety neurosis and anxiety hysteria but also between

Do not imagine that what I am telling you now about aff cts is the common property of normal psych logy On the contr ry these con eptions ha e grown on the soil of psycho anal s and are only indigenous there What psych logy has to say about affects—the James Lange theory for nstan e—is utte ly incom prehensibl to us psycho analysts and impos sible for us to discuss We do not however regard what we kn w of affects as at all final it is a first attempt to take ou bearings in this obscure region. To c ntinue then we believe we know what this early impress on is which is reproduced as a repetitio in the anxi ty a ct. We think t s the experience f *birth*—an xperi nce which n olves ju t such a con

life is endangered ever alt r to be r pa u d again in us as the dread or nxiety co dition The enormous increase in stim lat on effected by the interruption of th re ewal of blood (the int rnal respi ati n) was the cause of the anxiety experience at b rth—the first anxiety was th ref e toxically induced The name *A g t* (anxiety)—*angustiæ E ge* a narrow place a stra t—a ce tuates th characteristic tightening in the breathi g which w s then the consequ ce of a real situation and is subsequently repeated almost invariably with an affect. It is ery sugge tive too that th first anxiety state a e on the occasion of the separation from the moth W n t rally belie that the disposition to reprod ce this first anxiety condition has bec me so deeply in grained n the organism thr u h countless generations that o single indi idual can escape the anxi ty ff ct even though, like the l gend ary M cduff h "was f om h m thers womb untim ly ripped and s did not him elf ex perienc th act of birth. What the pr totype of th anxi ty c d t on may be fo other animals than mammals we cannot say n ther d we know what th comple f sensat ons in them is which equi alent to f in us.

It may pe haps intere t you to know how it was poss ble t rri at su h an d as this—that b rth is th e and prototype of the anxiety ffect Speculation had least of all to do with t on th o trary I b rr wed a thought from the na e tuti e mind f the peopl Many y rs ago a numb of y ung house-ph si ians, in lud g myself were sit ting round dinn t bl d of the assistants at the obst trical clinic was telling us all the funny stories of the last midwi es examination One of the cand dates was asked what it meant when the meconium (child s excreta) was present in the waters at b rth and promptly replied That the child is frightened. She was ridiculed and failed. But I silently took her part and began to suspect that the poor unsophisticated woman s u erring perception had revealed a very important connection

Now let us turn to neu otic anxiety what are the special man festations and conditions found in the anxiety of nervous persons? There is a great deal to be described here F rst of all, we find a general apprehensiveness in them a *free float ng* anxiety as we call it ready to ttach itself to any thou ht which is at all app opriate affecting judgments induci g expectat ons lying in wait for any opportunity to find a justification for itself We call this conditi n *expectant dread* or *anxious expectat on* P ople who are tormented with this kind of anxiety always antic pate the worst of all po ible outcomes interpret every chance happening as an evil omen and exploit every uncertainty to mean the worst. The tende cy to this kind of expectation of evil is found as a character trait in many people who cannot be described as ill n any othe way and we call them *ver-anxious* or pessimistic but a ma ked degree of expectant dread is an invari bl accompan me t of the nervous d sorder wh ch I ha e called anxiety neu os s and in clude m ng the actual neuroses

In contrast t this type of anxiety a second form of it is found to be much more circum scribed in the m nd, and attached t defin te objects and situatio s This is the anxiety of

phobia by go g u Greek title they s und like th te pl gues of Egypt e ept that there are far more than ten of th m J t l sten to

by land or sea and s on As a first att mpt to take s be rings in thi cha s we m y d vide them into three gr ups Many of the obj cts and s tuatio s feared are ath s niste even to u n rm l peopl th y have some c nn t on w th danger and these ph b as are not entirely

to the perception of an external danger of an injury which is expected and foreseen it is bound up with the reflex of flight and may be regarded as an expression of the instinct of self preservation The occasions of it i e the objects and situations about which anxiety is felt will obviously depend to a great extent upon the state of the person s knowled e and feeling of power regarding the outer world It seems to us quite natural that a savage should be afraid of a cannon or of an eclipse of the sun while a white man who can handle the weapon and foretell the phenomenon remains unafraid in the same situation At other times it is knowledge itself which inspires fear be cause it reveals the dan er sooner thus a savage will recoil with terror at the sight of a track in the jungle which conveys nothing to an ignorant white man but means that some wild beast is near at hand and an experienced sailor will perceive with dread a little cloud on the horizon because it means an approaching hurricane while to a passenger it looks quite insignificant

The view that objective anxiety is rational and expedient however will on deeper con sideration be admitted to need thorough re vision In face of imminent danger the only expedient behaviour actually would be first a cool appraisement of the forces at disposal as compared with the ma nitude of the danger at hand and then a decision whether flight or defence or possibly attack offered the best prospect of a successful outcome Dread how ever has no place in this scheme everything to be done will be accomplished as well and probably better if dread does not develop You will see too that when dread is excessive it becomes in the highest degree inexpedient it paraly es every action even that of flight The reaction to danger usually consists in a com bination of the two things the fear affect and the defensive action the frightened animal is afraid *and* flees but the expedient element in this is the *flight* not the *being afraid*

One is tempted therefore to assert that the development of anxiety is never expedient perhaps a closer dissection of the situation in dread will give us a better insight into it The first thing about it is the *readiness* for danger which expresses itself in heightened sensorial perception and in motor tension This ex pectant readiness is obviously advantageous indeed absence of it may be responsible for grave results It is then followed on the one hand by a motor action taking the form pri marily of flight and on a higher level of defensive action and on the other hand by the condition we call a ensation of *anxiety* or dread The more the development of dread is limited to a flash to a mere signal the less does it hinder the transition from the state of anx ious readiness to that of action and the more expediently does the whole course of events proceed The *anxious readiness* therefore eems to me the expedient element and the *develop ment* of anxiety the inexpedient element in what we call anxiety or dread

I shall not enter upon a discussion whether the words *anxiety fear fright* mean the same or different things in common usage In my opinion *anxiety* relates to the condition and ignores the object whereas in the word *fear* attention is directed to the object *fright* does actually seem to possess a special meaning—namely it relates specifically to the condition induced when danger is unexpectedly encoun tered without previous anxious readiness It might be said then that anxiety is a protection again fright

It will not have escaped you that a certain ambiguity and indefiniteness exists in the use of the word *anxiety* It is generally understood to mean the subjective condition arising upon the perception of what we have called *de veloped* anxiety such a condition is called an *affect* Now what is an affect in a dynamic sense? It is certainly something very complex An affect comprises first of all certain motor innervations or discharges and secondly cer tain sensations which moreover are of two kinds—namely the perceptions of the motor actions which have been performed and the directly pleasurable or painful sensations which give the affect what we call its dominant note But I do not think that this description pene trates to the essence of an affect With certain affects one seems to be able to see deeper and to recognize that the core of it binding the whole complex structure together is of the nature of a *repetition* of some particular very significant previous experience This experience could only have been an exceedingly early im pression of a universal type to be found in the previous history of the species rather than of the individual In order to be better understood I might say that an affective state is con structed like an hysterical attack i e is the pre cipitate of a reminiscence An hysterical attack is therefore comparable to a newly formed individual affect and the normal affect to a universal hysteria which has become a heritage

bring neurotic anxiety in which uch a small part o e at *all* is played by dan~er into relation with *object e anxiety* wh ch is essen tially a reacti to *danger*? And how is neu rotic anx ty to be understood? We will at present hold fa t to the expectation that where there i anxiety the e must be som thing of wh h one is fraid.

Clinical observation yields various clues to th compreh sion of neurot c anxiety and I will now discuss th ir ignificance with you

(a) It is not difficult to see that expectant dread or general apprehensi e ess tands in intimat relation to certain proces es in the sexual life—let us say to certain modes of lib do-utilization The implest and most in structive case of this kind arises in people who expose themselves to what is called frustrated excitation, i.e. when a powerful *sexual* e cita ti experiences insuffic ent dis harge and is not carried o to *satisfying terminat on*. This occurs f r nst nce n men during th time of an engagement to marry and in women whose husbands are t uffic ently pote t or who per form the sexual ct too rapidly or incompletely with a view to preventing con epti n. Under these conditions the libidinal excitat on disappears and anxiety appears in place of t both in the f rm f expectant dread and in that of tacks and anx ty-equi alents The precau tionary measu of *oitus nterruptus* when practised as a customary sexual égime is so regularly th cause of anx ty neu osis in men, and even m e so in women, that medical prac titioners would be wise to enquir first of all int the poss bility f su h an *etiology in all* such cases. Innum rable examples show that the anxiety-neurosis vanishes when the sexual malpractice is given up

So far as I know the fact that a connection exists between sexual restraint nd anxiety on ditions is o longer disputed en by physi cians wh h ld aloof from psy ho-analysis Nevertheles I can w ll magine that they do not ne ect to invert the conn ct on and t put forward the ew that such persons are pre disposed t apprehens enes and consequently practice ca tion in sexual matters Again t this however deci d ce is found in the re ctions in women in whom th sexual funct n is essentially passive so that its c rse is determined by the treatment acc rded by the man. The mor *temperament* e. the mo e inclination for sexual intercourse and capacity for satisfaction, w man has the more cer tainly will she react with anxiety manifesta tions to the man s impotence or to *co tus nter ruptus* whe eas such abuse entails far less h esthetic women or those

ays so course only has the same ignificance for anxi ty con ditions when the l b d which is denied a satisfactory outlet is correspo dingly ins stent and is not being utilized to a large extent in sublimation Whether or not illness will ensue is indeed alw ys a matter of the quantitati e fac tor E en apart from illness *it is easy to see* in the pher of character format o that sex ual restraint goes hand *in* hand with a ertain anxiousness and cautiou ne s whereas fearlessness and a boldly ad enturous spirit bring with th m a free tolerance of sexual needs However *these relations* may be altered and complicated by the manifold influ nces of ci lization it re mains inconte tible that for the a erage hu man being anxiety is closely connected with sexual restriction.

I ha e by no means told you all the observa ti ns which point to this genetic connection betwee lib do and anx ty The e is for in st nce the effect upo anxiety tates of certain periods of life such as puberty and the menopause in which th p oduction of l b do is c ns derably ugme ted In many states of excit m t too the mi gling of sexual excita ti with anxiety may be directly observed as well as th final replacement of the lib dinal excitation by anx ty Th impress on rece ed from ll this is double o first that t is *a matter of an a cumulation of libido* d barred f om its n rmal utilizat o and seco dly that *th question is ne of mat c p ocesses only* H w anx ty develops o t of sexu l desir is at present bscure we can only *ascertain* that des re is lacking and anxiety is found in ts plac

(b) A second clue s obtained f om analysis f the psy h u oses in particula of hys t ria. We ha e heard that anx ty frequently ac mpanie th sympt ms in this disea e and that unattached anxiety may lso be chronically present or com t exp es on ttacks The patients cannot say what t is they fea they link it up by unmistakable seco dary elabora tion to the m st nvent t phobias f dying of go mad of having a troke etc When we subj ct to analysis the *situation in* which the anxiety th symptom ccompanied by anx ety arose we can rul discover what normal m tal p ocess has been checked in its

incomprehensible to us although their intensity seems very much exaggerated Most of us for instance have a feeling of repulsion upon encountering a snake It may be said that the snake phobia is universal in mankind Charles Darwin has described most vividly how he could not control his dread of a snake that darted at him although he knew that he was protected from it by a thick plate of glass The second group consists of situations that still have some relation to danger but to one that is usually belittled or not emphasized b mo t

u i way train than at home —namely a collision we also know that a ship may sink whereupon it is usual to be drowned but we do not brood upon these dangers and we travel without anxiety by train and boat Nor can it be denied that if a bridge were to break at the moment we are crossing it we should be hurled into the torrent but that only happens so very occasionally that it is not a danger worth considering Solitude too has its dangers which in certain circumstances we avoid but there is no question of never bein able to endure it for a moment under any conditions The same thing applies to crowds enclosed spaces thunderstorms and so on What is foreign to us in these phobias is not so much their content as their intensity The anxiety accompanying a phobia is positively indescribable! And we sometimes get the impression that neurotics are not really at all fearful of those things which can under certain conditions arouse anxiety in us and which they call by the same names

There remains a third group which is entirely unintelligible to us When a strong full grown man is afraid to cross a street or square in his own so familiar town or when a healthy well developed woman becomes almost senseless with fear because a cat has brushed against her dress or a mouse has scurried through the room how can we see the connection with danger which is obviously present to these people? With this kind of animal phobia it is no question of an increased intensity of common human antipathies to prove the contrary there are numbers of people who for instance cannot pass a cat without attracting and petting it A mouse is a thing that so many women are afraid of and yet it is at the same time a very favourite pet name many a girl who is delighted to be called so by her lover will scream with terror at the sight of the dainty little creature itself The behaviour of the man who is afraid to cross streets and squares only suggests one thing to us—that he behaves like a little child A child is directly taught that such situations are dangerous and the man s anxiety too is allayed when he is led by ome one across the open space

The two forms of anxiety described the *free floating* expectant dread and that attached to phobias are independent of each other The one is not the other at a further sta e they are only rarely combined and then as if fortuitously The most intense general apprehensiveness does not necessarily lead to a phobia people who have been hampered all their lives by agoraphobia may be quite free from pessimistic expectant dread. Many phobias e g fear of open spaces of railway travellin are demonstrably acquired first in later life others such as fear of darkness thunder animal seem to have existed from the beginnin The former signify serious illness the latter are more of the nature of idiosyncrasies peculiarities anyone exhibiting one of these latter may be suspected of harbouring others imilar to it I must add that we group all these phobias under *anxiety hysteria* that is we regard them as closely allied to the well known di order called conversion hysteria

The third form taken by neurotic anxiety brings us to an enigma there is no visible connection at all between the anxiety and the dan er dreaded This anxiety occurs in hysteria for instance accompanying the hysterical symptoms or under various conditions of excitement in which it is true we should expect some affect to be displayed but least of all an anxiety affect or without reference to any conditions incomprehensible both to us and to the patient an unrelated anxiety attack We may look far and wide without discovering a danger or an occasion which could even be exaggerated to account for it These spontaneous attacks show therefore that the complex condition which we describe as anxiety can be split up into components The whole attack can be represented (as a substitute) by a single intensively developed symptom—shuddering faintness palpitation of the heart inability to breathe—and the general feeling which we recognize as anxiety may be absent or may have become unnoticeable And yet these states which are termed *anxiety equivalents* have the same clinical and aetiological validity as anxiety itself

Two questions arise now Is it possible to

ing neurotic anxiety in which such a small part or none at all is played by danger into

there is anxiety there must be something of which one is afraid.

Clinical observation yields various clues to the comprehension of neurotic anxiety and I will now discuss their significance with you.

(a) It is not difficult to see that expectant dread or general apprehensiveness stands in intimate relation to certain processes in the sexual life—let us say to certain modes of libido-utilization. The simplest and most instructive case of this kind arises in people who expose themselves to what is called frustrated excitation, i.e., when a powerful sexual excitation experiences insufficient discharge and is not carried on to a satisfying termination. This occurs, for instance, in men during the time of an engagement to marry and in women whose husbands are not sufficiently potent or who perform the sexual act too rapidly or incompletely with a view to preventing conception. Under these conditions the libidinal excitation disappears and anxiety appears in place of it both in the form of expectant dread and in that of attacks and anxiety-equivalents. The precautionary measure of *coitus interruptus* when practised as the customary sexual regime is so regularly the cause of anxiety-neurosis in men, and even more so in women, that medical practitioners would be wise to enquire first of all into the possibility of such an etiology in all such cases. Innumerable examples show that the anxiety-neurosis vanishes when the sexual malpractice is given up.

So far as I know the fact that a connection exists between sexual restraint and anxiety conditions is no longer disputed, even by physicians who hold aloof from psycho-analysis. Nevertheless I can well imagine that they do not neglect to invert the connection, and to put forward the view that such persons are predisposed to apprehensiveness and consequently practise caution in sexual matters. Against this however decisive evidence is found in the reactions in women, in whom the sexual function is essentially passive so that its course is determined by the treatment accorded by the man. The more *temperament*, i.e. the more inclination for sexual intercourse and capacity for satisfaction, a woman has the more certainly will she react with anxiety manifestations to the man's impotence or to *coitus interruptus* whereas such abuse entails far less serious results with anaesthetic women or those in whom the sexual hunger is less strong.

Sexual abstinence which is nowadays so warmly recommended by physicians of course only has the same significance for anxiety conditions when the libido which is denied a satisfactory outlet is correspondingly insistent and is not being utilized to a large extent in sublimation. Whether or not illness will ensue is indeed always a matter of the quantitative factor. Even apart from illness it is easy to see in the sphere of character formation that sexual restraint goes hand in hand with a certain anxiousness and cautiousness whereas fearlessness and a boldly adventurous spirit bring with them a free tolerance of sexual needs. However these relations may be altered and complicated by the manifold influences of civilization, it remains incontestible that for the average human being anxiety is closely connected with sexual restriction.

I have by no means told you all the observations which point to this genetic connection between libido and anxiety. There is for instance the effect upon anxiety states of certain periods of life such as puberty and the menopause in which the production of libido is considerably augmented. In many states of excitement too the mingling of sexual excitation with anxiety may be directly observed as well as the final replacement of the libidinal excitation by anxiety. The impression received from all this is a double one: first that it is a matter of an accumulation of libido debarred from its normal utilization and secondly that *the question is one of somatic processes only*. How anxiety develops out of sexual desire is at present obscure; *we can only ascertain that desire is lacking and anxiety is found in its place.*

(b) A second clue is obtained from analysis of the psychoneuroses in particular of hysteria. We have heard that anxiety frequently accompanies the symptoms in this disease and that unattached anxiety may also be chronically present or come to expression in attacks. The patients cannot say what it is they fear; they link it up by unmistakable secondary elaboration to the most convenient phobias of dying, of going mad, of having a stroke etc. When we *subject to analysis the situation* in which the anxiety or the symptom accompanied by anxiety arose we can as a rule discover what *normal* mental process has been checked in its

incomprehensible to us although their intensity seems very much exaggerated Most of us for instance have a feeling of repulsion upon encountering a snake It may be said that the snake phobia is universal in mankind Charles Darwin has described most vividly how he could not control his dread of a snake that darted at him although he knew that he was protected from it by a thick plate of glass The second group consists of situations that still have some relation to danger but to one that is usually belittled or not emphasized h mo t

[illegible] way train than at home —namely a collision we also know that a ship may sink whereupon it is usual to be drowned but we do not brood upon these dangers and we travel without anxiety by train and boat Nor can it be denied that if a bridge were to break at the moment we are crossing it we should be hurled into the torrent but that only happens so very occasionally that it is not a danger worth considering Solitude too has its dan ers which in certain circumstances we avoid but there is no question of never bein able to endure it for a moment under any conditions The same thing applies to crowds enclosed spaces thunderstorms and so on What is foreign to us in these phobias is not so much their content as their intensity The anxiety accompanying a phobia is positively indescribable! And we sometimes get the impression that neurotics are not really at all fearful of those things which can under certain conditions arouse anxiety in us and which they call by the same names

There remains a third group which is entirely unintelligible to us When a strong full grown man is afraid to cross a street or square in his own so familiar town or when a healthy well developed woman becomes almost senseless with fear because a cat has brushed against her dress or a mouse has scurried through the room how can we see the connection with danger which is obviously present to these people? With this kind of animal phobia it is no question of an increased intensity of common human antipathies to prove the contrary there are numbers of people who for instance cannot pass a cat without attracting and petting it A mouse is a thing that so many women are afraid of and yet it is at the same time a very favourite pet name many a girl who is delighted to be called so by her lover will scream with terror at the sight of the dainty little creature itself The behaviour of the man who is afraid to cro s streets and squares only suggests one thing to us—that he behaves like a little child A child is directly taught that such situations are dangerous and the man s anxiety too is allayed when he is led by ome one across the open space

The two forms of anxiety described the *free floating* expectant dread and that attached to phobias are independent of each other The one is not the other at a further stage they are only rarely combined and then as if fortuitously The most intense general apprehensiveness does not necessarily lead to a phobia people who have been hampered all their lives by agoraphobia may be quite free from pessimistic expectant dread Many phobias e g fear of open spaces of railway travelling are demonstrably acquired first in later life others such as fear of darkness thunder animals seem to have existed from the beginnin The former signify serious illness the latter are more of the nature of idiosyncrasies peculiarities anyone exhibiting one of these latter may be suspected of harbouring others similar to it I must add that we group all these phobias under *anxiety hysteria* that is we regard them as closely allied to the well known di order called conversion hysteria

The third form taken by neurotic anxiety brings us to an enigma there is no visible connection at all between the anxiety and the danger dreaded This anxiety occurs in hysteria for instance accompanying the hysterical symptoms or under various conditions of excitement in which it is true we should expect some affect to be displayed but least of all an anxiety affect or without reference to any conditions incomprehensible both to us and to the patient an unrelated anxiety attack We may look far and wide without discovering a dan er or an occasion which could even be exaggerated to account for it These spontaneous attacks show therefore that the complex condition which we describe as anxiety can be split up into components The whole attack can be represented (as a substitute) by a single intensively developed symptom—shuddering faintness palpitation of the heart inability to breathe—and the general feeling which we rec o nize as anxiety may be absent or may have become unnoticeable And yet these states which are termed *anxiety equivalents* have the same clinical and aetiological validity as anxiety itself

TWENTY SIXTH LECTURE

THE THEORY OF THE LIBIDO NARCISSISM

We ha e repeatedly and gai quit recently referred to the dist ct n betw en th sexual and the ego-instincts F rst f all repre sion showed how they can oppose each other how the sexual in t ncts are then apparently brought to subm sion, and required to procure their satisf ction by circuit us regres ive paths where in their impregnab l ty they obtain com pensation fo their defeat. Then it appeared that from the out et they each ha e a d ffere t relation to the ta k mist ess Necess ty so that the developments are d fferent and they ac qu e diffe ent attit des to the reality-pri ciple Finally we bel e e we can ob erve that the sexual i stincts are connected by much closer t es with the affecti e state of anxiety than are th ego-instincts—a co clusion which in o e important point only st ll eems incomplete. In support of t we may bring forward the further remarkable fact that want of satisfac t on f h nger or thirst the two most ele mental f the self preservati e inst ncts never results in c n e s n f them into anxiety whereas the conversion of unsatisfied libido i to anxiety is as we have hea d a ery well kn wn and frequently observed phenom n n.

Our justifi at n for distinguishin between sexual d ego in tincts can surely n t be con tested t is indeed a sumed by the exi te ce of the exual stinct as a pec al activity in the i dividual. The only que ti n is what signifi cance is t be attach d to this d t n t n, how radical a d decisive w intend to consider it The answ to this depends upon what w can as ertain ab ut the ext t to wh ch the sexual instincts both in the r bodily and the mental man festat ons ond ct them elves d ffere tly from the th r instincts whi h w set ag inst th m and how important the r ults arising f m these diffe e ces are found to be We ha e of ourse no moti e for m intai ing a y difference in the fundame tal nature of the two groups f instincts and by the way t would be difficult t app ehend any They both present themsel es to u merely as descriptio s f th so rces f e ergy in the indi d l and the discuss on wheth r fundamentally they are e r essentially differe t and if e wh n th y becam sep rated f m each oth r can n t be carri d th u h on the bas s of these c cepts lo e but must be grounded on the b ol gical f cts und lying th m At p ese t w kn w too little bout this and eve if w knew m re t w uld not be elevant to the task f psycho-analys

W sh uld clea ly also profit ery l ttl by emphasizi g the primordial unity of all the in stin ts as Jung has d n and d s ribing all the energie which flow f om them as *l bido*

ing that real anxiety does eventually awake in him

Now if some children embrace this training in apprehensiveness very readily and then find for themselves dangers which they have not been warned against it is explicable on the ground that these children have inherently a greater amount of libidinal need in their constitution than others or else that they have been spoiled early with libidinal gratifications It is no wonder if those who later become nervous also belong to this type as children we know that the most favourable circumstance for the development of a neurosis lies in the inability to tolerate a considerable degree of pent up libido for any length of time You will observe now that here the constitutional factor which we have never denied comes into its own We protest only when others emphasize it to the exclusion of all other claims and when they introduce the constitutional factor even where according to the unanimous findings both of observation and of analysis it does not belong or only plays a minor part

Let us sum up the conclusions drawn from the observation of apprehensiveness in children Infantile dread has very little to do with objective anxiety (dread of real danger) but is on the other hand closely allied to the neurotic anxiety of adults It is derived like the latter from undischarged libido and it substitutes some other external object or some situation for the love object which it misses

Now you will be glad to hear that the analysis of phobias has little more to teach us than we have learnt already The same thing happens in them as in the anxiety of children libido that cannot be discharged is continuously being converted into an apparently *objective* anxiety and so an insignificant external danger is taken as a representative of what the libido desires The agreement between the two forms of anxiety is not surprising for infantile phobias are not merely prototypes of those which appear later in anxiety hysteria but they are a direct preliminary condition and prelude of them Every hysterical phobia can be traced back to a childish dread of which it is a continuation even if it has a different content and must be called by a different name The difference between the two conditions lies in their mechanism In order that the libido should be converted into anxiety in the adult it is no longer sufficient that the libido should be momentarily unable to be utilized The adult has long since learned to maintain such libido suspended or to apply it in different ways But, when the libido is attached to a mental excitation which has undergone repression conditions similar to those in the child in whom there is not yet any distinction between conscious and unconscious are re established and by a regression to the infantile phobia a bridge so to speak is provided by which the conversion of libido into anxiety can be conveniently effected As you will remember we have treated repression at some length but in so doing we have been concerned exclusively with the fate of the *idea* to be repressed naturally because this was easier to recognize and to present But we have so far ignored the question of what happened to the *affect* attached to this idea and now we learn for the first time that it is the immediate fate of the affect to be converted into anxiety no matter what quality of affect it would otherwise have been had it run a normal course This transformation of affect is moreover by far the more important effect of the process of repression It is not so easy to present to you for we cannot maintain the existence of unconscious affects in the same sense as that of unconscious ideas An idea remains up to a point the same whether it is conscious or unconscious we can indicate something that corresponds to an unconscious idea But an affect is a process involving a discharge of energy and it is to be regarded quite differently from an idea without searching examination and clarification of our hypotheses concerning mental processes we cannot tell what corresponds with it in the unconscious— and that cannot be undertaken here However we will preserve the impression we have gained that the development of anxiety is closely connected with the unconscious system

I said that conversion into anxiety or better discharge in the form of anxiety was the immediate fate of libido which encounters repression I must add that it is not the only or the final fate of it In the neuroses processes take place which are intended to prevent the development of anxiety and which succeed in so doing by various means In the phobias for instance two stages in the neurotic process are clearly discernible The first effects the repressions and conversion of the libido into anxiety which is then attached to some external danger The second consists in building up all those precautions and safeguards by which all contact with this externalized danger shall be avoided Repression is an attempt at flight on the part of the ego from the libido which it

feels to be dangerous the phob a ma be com pared to fortificati n gain t the outer dan ger which now tand for the dreaded lib do The weakness of this defe e system in the phob as i. of course that the fortress whi h is so well guarded from without rema ns ex posed t danger from within projection ex ternally of dange from lib do can never be a ery succe ful m asure In the oth r neurose therefore other defensive syst m are emplo ed against the pos bility of the devel pment of anxiety this is a ery inte estin part of the psy hology of the neuroses U f rtunately it would tak us too far field and al t would require a thoro gh grounding in special knowl edge of the subject. I will m rely add this I have already poke of the *counte -charges* that are in tituted by the ego upo repres i n which must be maintained so that the repre n can persist. It is the ta k of this counte -charge to carry out the vari us f rm f defe ce against th developme t of anxiety after repression

T return t the ph bias I may n w hope that you realize how inadequate t is to ttempt merely to explain their c t nt and to tak no in erest in them apart from their deri at n— this or that object or s tuat on which has bee mad into a phobia. The co tent of the ph bia has an importance comparabl to that of the manifest dream—it is a façad With all d e modifications it is to be dm tted that among th tents of th arıou ph b as ma y re found which, as tanle Hall points o t re specially suited by phyl gen t inheritance to become objects of dread It is even in gre ment with this that many f these dread d things ha e c nn ction with danger e cept through a *symb lic* relati to t.

Thus we re con nced of the quite entral posi n which the problem f anxi ty fills in the psych logy f the eu oses. We ha e re cei ed strong imp ession f how th develop ment f anxi ty bound up with th f te of the lib do and with th un nsci u ystem There is only on unco nected thread only o gap in o tructur th fact whi h fter all can hardly be d puted that *b tive* *kety* must be regarded as xp es on f the ego s inst ct for self pres rvation.

TWENTY SIXTH LECTURE

THE T EO Y HE LIBIDO NARCISSISM

WE ha e repeatedl and gai quit recently ref rred to th d stinct between the sexual and the ego-in tincts First f all, repre sion showed how they can oppose each other how the sexual i tincts are then apparently brought to submi on and required to procure their sat sfact on by c rcu tous regress e paths where in their impregnability they obtain com pensation for the r defeat. Then it appeared that from the out et they each ha e a d fferent relat on to the task m stress Necess ty so that the r developments are different and they ac quire different attitudes to the reality-principle Finally we believe we can observe that the sexual instincts are conn cted by much closer ties with the affective tate of anxiety than re the ego-inst ncts—a conclusion which in one important po nt only still eems incomplete. I support of it we ma brin forward the further rem kable fact that want of satisfac tion f hunger or thirst the two mo t ele mental f th self preservati e insti cts never results in con ers on of th m into nxiety whereas th con ers n of unsatisfied l b do into anxiety is as we have heard, a very well known and frequently observed phen menon.

Our justificatio for distingui hin between sexual and ego-instincts can surely n t be con tested it is indeed a sumed by the existence of th sexu l i stinct as a special activity in the indiv dual. The only questi n s what signifi cance is to be tt hed t this d tinct on h w radical and deci ive we intend to ons de it. The answe to this depends upon what we can ascertain abo t the xte t to whi h the sexual instinct both the bodily and th r mental manifestat ons, c nd ct them elve d fferently from the th r instincts which we set aga nst them and how important the results arising f om these differ nces a e found to be We ha e of course no m ti e for maintaining any difference in the fundame tal nature f the two groups of nstincts and by th way it would be difficult to app h nd any They both p esent themsel es to us merely as descript ons f the sou s f energy in the individ l and the di cuss on whether fundamentally they re o e essentially different and if ne when they becam separated f om each the can t be carried thr ugh on the bas s of thes c cepts alon but must be grounded on th b l gical facts und lying them At present w know too l ttl about this, and even if we knew m re it w uld not be relevant to th task of psy ho-analysi

We hould clea ly als profit ery l ttle by emphasizing th prim rdial un ty of all the in stin ts as Jung has done and describ g all th energie which fl w from them as *l bido*

We should then be compelled to peak of sex ual and asexual libido since the sexual func tion is not to be eliminated from the field of mental life by any such device The name *libido* however remains properly reserved for the in stinctual forces of the sexual life as we have hitherto employed it

In my opinion therefore the question how far the quite justifiable distinction between sex ual and self preservative instincts is to be car ried has not much importance for psycho analy sis nor is psycho analysis competent to deal with it From the biolo ical point of view there are certainly various indications that the d t [illegible]

[illegible] uual and secures its connec tion with its species It is undeniable that the exercise of this function does not always bring advantage to the individual as do his other activities but that for the sake of an excep tionally high de ree of pleasure he is involved by this function in dangers which jeopardize his life and often enough exact it Quite pe culiar metabolic processes different from all others are probably required in order to pre serve a portion of the individual s life as a disposition for posterity And finally the indi vidual organism that regards itself as first in importance and its sexuality as a means like any other to its own satisfaction is from a biological point of view only an episode in a series of generations a short lived appendage to a germ plasm which is endowed with virtual immortality comparable to the temporary holder of an entail that will survive his death

We are not concerned with such far reaching considerations however in the psycho analytic elucidation of the neuroses By means of fol lowing up the distinction between the sexual and the ego instincts we have gained the key to comprehension of the group of transference neuroses We were able to trace back their ori gin to a fundamental situation in which the sexual instincts had come into conflict with the self preservative instincts or—to express it bi ologically though at the same time less exactly —in which the ego in its capacity of independ ent individual organism had entered into oppo sition with itself in its other capacity as a member of a series of generations Such a dis sociation perhaps only exists in man so that taken all in all his superiority over the other animals may come down to his capacity for neurosis The excessive development of his libido and the rich elaboration of his mental life (perhaps directly made possible by it) seem to constitute the conditions which give rise to a conflict of this kind It is at any rate clear that these are the conditions under which man has progressed so greatly beyond what he has in common with the animals so that his capacity for neurosis would merely be the obverse of his capacity for cultural develop ment However these again are but specula tions which distract us from the task in hand.

Our work so far has been conducted on th assumption that the manifestations of the ex ual and the ego instincts can be distinguished from one another In the transference neuroses this is possible without any difficulty We called the investments of energy directed by the ego towards the object of its sexual desires *libido* and all the other investments proceeding from the self preservative instincts its *interest* and by following up the investments with libido their transformations and their final fates we were able to acquire our first insight into the workings of the forces in mental life The trans ference neuroses offered the best material for this exploration The ego however—its compo sition out of various organizations with their structure and mode of functioning—remained undiscovered we were led to believe that analy sis of other neurotic disturbances would be required before light could be gained on these matters

The extension of psycho analytic conceptions on to these other affections was begun in early days Already in 1908 K Abraham expressed the view after a discussion with me that the main characteristic of dementia praecox (reck oned as one of the psychoses) is that in this disease *the investments of objects with libido is lacking (The Psycho Sexual Differences be tween Hysteria and Dementia Praecox)* But then the question arose what happens to the libido of dementia patients when it is diverted from its objects? Abraham did not hesitate to answer that it is turned back upon the ego and that *this reflex reversion of it is the sou ce of the delusions of grandeur in dementia prae cox* The delusion of grandeur is in every way comparable to the well known overestimation of the object in a love relationship Thus we come for the first time to understand a feature of a psychotic affection by bringing it into re lation to the normal mode of loving in life

I will tell you at once that these early views of Abraham s have been retained in psycho- analysis and have become the basis of our posi tion regarding the psychoses We became slowly

accustomed to the conceptio that the *libido* which we find attached t certain bjects and ich th expres o of a desire to gain some satisfaction in these objects can also abandon these bjects and set the ego tself n the r plac and gradually this view d eloped t elf mor and m re consistently The name for this utilization of the lib do—Narcissism—we borrowed from a pervers n described by P Nacke in which an ad lt indi id al la hes upon his own body all th caresses usually xpended o ly upon a sexual obj ct *other than himself*

Reflection, then at once di cl sed that if a fixati n of this kind to the subject s own body and his own perso can o cur it cannot be an entirely exceptio al or meani less phenome non. On th c ntrary t is probable that this narcissism is the universal original co dition o t f which *object-l ve* dev lops later w th out thereby ecessarily ffecting a d sappear ance f the na cissism One also had to remember th evol tion f object lib do in which to begin w h many of the sexual impulses are gratified on the child s own body—as we say a to-erotically—and that this capac ty fo au

was the sexual activity of th na c ssisti phase of direction of the Lib d

To put t briefly w f rmed n dea f the relat between the *ego-lib do* and the *object lib do* which I can ill trat t you by a comparison taken f om zool gy Think f the m plest form f lif onsi ting of little mass of only slightly di ere tiated protoplasmi substances. They extend protrusi ns which are called p dopodia nto which the protoplasm overfl ws They can however gain withdraw these exten ns of themsel es and e form themselves into mass W mpare this ex tending f pr tru on to th radiation of lib do on t th bject while the greatest v lum f libid may yet remain within the ego we inf that und rmal c d t ns ego-lib do can transform tself int obj ct lib d without dif ficulty and that thi can gain subsequently be bsorbed into the eg

W th th help of these c cept ns t is n w pos b to explain a whol series f mental st es or to express t m re modestly t describe in terms f the l b do-theory co diti ns that be ong t rmal l f f nstan e th mental tutud pertaining to th conditi ns f "bei g i lo e of rgani llness and of leep Of th condit f leep w as umed that it is f unded upon a withdrawal from the outer world and a concentration upon the wish to sleep We found that the nocturnal mental ac ti ty which is expres ed in dreams served the purpose of the wish to leep a d moreo er that it was go erned exclu i ely by ego st c moti es In the l ght of the libido theory we may carry this further and say that sleep is a — f ob ects

not this hed a new li ht upon t e re pe a afforded by sleep a d upon the nature of fa tigu in general? The likeness we see in the condi n which the sleeper conjures up again ev ry night to the blissful isolat on of the intra uterine existence is thus confirmed and ampli fied i ts mental a pects In the sleeper the primal state of the libido-d stribution is again rep od ced that of absolut narc ssism in which lib do and ego-interests dwell together still un ted and indistinguishable in the self sufficient elf

Two observati ns are in place here. First, how is the co cept *narcissism* distingu hed fr m *egoism?* In my opinion, narcissi m is the lib dinal omplement f eg ism When one pe ks of egoism o e i thinki g only of the *terest* f the pers n concerned narcis ism relates also t the satisf cti n of his l bidinal needs It is poss ble t f llow up the two separately for a cons derable d tance as practi cal moti es in life A man m y be abs l tely egoi tic and yet ha e strong lib dinal att ch

the object in ol e no injury to his ego A man may be egoi tic and at the same time stron ly narcissistic (i e feel very little need for object) a d this again e ther in the f rm taken by the need for direct sexual satisfaction o in those higher f rms of feeling deri ed f om the sexual needs which are commonly call d *love* and a su h are c trast d with *sensual ty* In ll thes tuat ons g sm s the self ev dent th con tant eleme t, and narcissism th ariabl on Th antithes s of eg sm c. *tru m* not a alternati e t rm f r th in estm t of an object with lib d t distinct from the latte in its lack of the desire f r sexual sati faction in the bj ct. B t wh n the co diti f l e is developed t it fullest in ten ty ltruism coincides w th the in estm nt f an bject with lib do As a rule th sexual bject draws to tself a porti n f the ego s

narcissism which becomes apparent in what is called the *sexual overestimation* of the object If to this is added an altruism directed towards the object and derived from the egoism of the lover the sexual object becomes supreme it has entirely swallowed up the ego

I think you will find it a relief if after these scientific phantasies which are after all very dry I submit to you a poetic description of the *economic* contrast between the condition of narcissism and that of love in full intensity I take it from a dialogue between Zuleika and her lover in Goethe s *Westostliche Divan*

Zuleika

The slave the lord of victories
The crowd with single voice confess
In sense of personal being lies
A child of earth s true happiness
There s not a life he need refuse
If his true self he does not miss
There s not a thing he cannot lose
If he remains the man he is

Hatem

So it is held! so well may be!
But down a different track I come
Of all the bliss earth holds for me
I in Zuleika find the sum
Does she expend her being on me
Myself grows to myself of cost
Turns she away then instantly
I to my very self am lost
And then with Hatem all were over
Though yet I should but change my state
Swift should she grace some happy lover
In him I were incorporate

The second observation is an amplification of the theory of dreams The way in which a dream originates is not explicable unless we assume that what is repressed in the unconscious has acquired a certain independence of the ego so that it does not subordinate itself to the wish for sleep and maintains its investments although all the object investments proceeding from the ego have been withdrawn for the purpose of sleep Only this makes it possible to understand how it is that this unconscious material can make use of the abrogation or diminution in the activities of the censorship which takes place at night and that it knows how to mould the day s residue so as to form a forbidden dream wish from the material to hand in that residue On the other hand some of the resistance against the wish to sleep and the withdrawal of libido thereby induced may have its origin in an association already in existence between this residue and the repressed unconscious material This important dynamic factor must therefore now be incorporated into the conception of dream formation which we formed in our earlier discussions

Certain conditions—organic illness painful accesses of stimulation an inflammatory condition of an organ—have clearly the effect of loosening the libido from its attachment to its objects The libido which has thus been withdrawn attaches itself again to the ego in the form of a stronger investment of the diseased region of the body Indeed one may venture the assertion that in such conditions the withdrawal of the libido from its objects is more striking than the withdrawal of the egoistic interests from their concerns in the outer world This seems to lead to a possibility of understanding hypochondria in which some organ without being perceptibly diseased becomes in a very similar way the subject of solicitude on the part of the ego I shall however resist the temptation to follow this up or to discuss other situations which become explicable or capable of exposition on this assumption of a return of the object libido into the ego for I feel bound to meet two objections which I know have all your attention at the moment First of all you want to know why when I discuss sleep illness and similar conditions I insist upon distinguishing between libido and interests sexual instincts and ego instincts while the observations are satisfactorily explained by assuming a single uniform energy which is freely mobile can invest either object or ego and can serve the purposes of the one as well as of the other Secondly you will want to know how I can be so bold as to treat the detachment of the libido from its objects as the origin of a pathological condition if such a transformation of object libido into ego libido —or into ego energy in general—is a normal mental process repeated every day and every night

The answer is Your first objection sounds a good one Examination of the conditions of sleep illness and falling in love would probably never have led to a distinction between ego libido and object libido or between libido and interests But in this you omit to take into account the investigations with which we start

T k w th ry l ht m d ficat f m Edwa d Dowd tra l t o —TR

ed in the light of which we now regard the mental situations under discussion The necessity of distinguishing between libido and interests between sexual and self preservative instincts has been forced upon us by our insight into the conflict from which the transference neuroses arise We have to reckon with this distinction henceforth The assumption that object libido can transform itself into ego-libido in other words that we shall also have to reckon with an ego-libido appears to be the only one capable of solving the riddle of what are called the narcissistic neuroses e.g. dementia praecox or of giving any satisfactory explanation of their likeness to hysteria and obsessions and differences from them. We then apply what we have found undeniably proved in these cases to illness sleep and the condition of intense love We are at liberty to apply them in any direction and see where they will take us The single conclusion which is not directly based on analytical experience is that libido is libido and remains so whether it is attached to objects or to the ego itself and never transformed into egoistic interests and vice versa. This statement however is another way of expressing the distinction between sexual instincts and ego-instincts which we have already critically examined and which we shall hold to from heuristic motives until such time as it may prove valueless

Your second objection too raises a justifiable question, but it is directed to a false issue. The withdrawal of object libido into the ego is certainly not pathogenic it is true that it occurs every night before sleep and ensues and that the process is reversed upon awakening. The protoplasmic animalcule draws in its protrusions and sends them out again at the next opportunity But it is quite a different matter when a definite very forcible process compels the withdrawal of the libido from its objects The libido that has then become narcissistic can no longer find its way back to its objects and this obstruction in the way of the free movement of the libido certainly does prove pathogenic It seems that an accumulation of narcissistic libido over and above a certain level becomes intolerable. We might well imagine that it was this that first led to the investment of objects that the ego was obliged to send forth its libido in order not to fall ill of an excessive accumulation of it. If it were part of our scheme to go more particularly into the disorder of dementia praecox I would show you that the process which detaches the libido from its objects and blocks the way back to them again is closely allied to the process of repression and is to be regarded as a counterpart of it In any case you would recognize familiar ground under your feet when you found that the preliminary conditions giving rise to these processes are almost identical so far as we know at present, with those of repression. The conflict seems to be the same and to be conducted between the same forces. Since the outcome is so different from that of hysteria for instance the reason can only lie in some difference in the disposition. The weak point in the libido-development in these patients is found at a different phase of the development the decisive fixation which as you will remember enables the process of symptom formation to break out is at another point probably at the stage of primary narcissism to which dementia praecox finally returns It is most remarkable that for all the narcissistic neuroses we have to assume fixation points of the libido at very much earlier phases of development than those found in hysteria or the obsessional neuroses You have heard however that the concepts we have elicited from the study of the transference neuroses also suffice to show us our bearings in the narcissistic neuroses which are in practice so much more severe. There is a very wide community between them fundamentally they are phenomena of a similar class You may imagine how hopeless a task it is for anyone to attempt to explain these disorders (which properly belong to psychiatry) without being first equipped with the analytic knowledge of the transference neuroses

The picture formed by the symptoms of dementia praecox incidentally a very variable one is not determined exclusively by the symptoms arising from the forcing of the libido back from the objects and the accumulation of it as narcissism in the ego Other phenomena occupy a large part of the field, and may be traced to the efforts made by the libido to reach its objects again which correspond therefore to attempts at restitution and recovery These are in fact the conspicuous clamorous symptoms they exhibit marked similarity to those of hysteria or more rarely of the obsessional neuroses they are nevertheless different in every respect It seems that in dementia praecox the efforts of the libido to get back to its objects that is to the mental ideas of its objects, do really succeed in conjuring up something of them, something that at the same

narcissistic type of object choice is also found as a trait in the disposition of manifest homo sexuals

You will remember that in the first lecture given this session I described to you a case of delusional jealousy in a woman Now that we have so nearly reached the end you will cer tainly want to know how we account for a delusion psycho analytically I have less to say about it than you would expect however The inaccessibility of delusions to logical argu ments and to actual experience is to be ex plained as it is with obsessions by the con nection they bear to the unconscious material which is both expressed by and held in check by the delusion or the obsession The differ ences between the two are based on the topo graphical and dynamic differences in the two affections

As with paranoia so also with melancholia (under which by the way very different clini cal types are classified) it has been possible to obtain a glimpse into the inner structure of the disorder We have perceived that the self re proaches with which these sufferers torment themselves so mercilessly actually relate to an other person to the sexual object they have lost or whom they have ceased to value on account of some fault From this we concluded that the melancholic has indeed withdrawn his libido from the object but that by a process which we must call *narcissistic identification* he has set up the object within the ego itself projected it on to the ego I can only give you a descriptive representation of this process and not one expressed in terms of topo raphy and dynamics The e o itself is then treated as though it were the abandoned object it suffers all the revengeful and aggressive treatment which is designed for the object The suicidal impulses of melancholics also become more in telligible on the supposition that the bitterness felt by the diseased mind concerns the ego itself at the same time as and equally with h

ly to the fore by this we mean a d recting of antithetical feelings (affectionate and hostile) towards the same person It is unfortunate that I have not been able to say more about ambiv alence in these lectures

There is also besides the narcissistic an hysterical form of identification which has long been known to us I wish it were possible to make the differences between them clear to you in a few definite statements I can tell you something of the periodic and cyclic forms of melancholia which will interest you It is pos sible in favourable circumstances—I have twice achieved it—to prevent the recurrence of the condition or of its antithesis by analytic treatment during the lucid intervals between the attacks One learns from this that in melan cholia and mania as well as other conditions a special kind of solution of a conflict is going on which in all its pre requisites a rees with those of the other neuroses You may imagine how much there remains for psycho analysis to do in this field

I also told you that by analysis of the nar cissistic disorders we hoped to gain some knowledge of the composition of the ego and of its structure out of various faculties and elements We have made a beginnin towards this at one point From analysis of the de lusion of observation we have come to the con clusion that in the ego there exists a faculty that incessantly watches criticizes and com pares and in this way is set against the other part of the ego In our opinion therefore the patient reveals a truth which has not been ap preciated as such when he complains that at every step he is spied upon and observed that his very thought is known and examined He has erred only in attributing this disagreeable power to something outside himself and for eign to him he perceives within his ego the rule of a faculty which measures his actual ego and all his activities by an *ego ideal* which he has created for himself in the course of his development We also infer that he created this ideal for the purpose of recovering thereby the self satisfaction bound up with the pri mary infantile narcissism which since tho e days has suffered so many shocks and mortifi cation We recognize in this self criticizin fac ulty the ego censorship the *conscience* it is the same censorship as that exercised at night upon dreams from which the repressions against inadmissible wish-excitations proceed When this faculty disintegrates in the delusion of being observed we are able to detect its origin and that it arose out of the influence of parents and those who trained the child to gether with his social surroundings by a proc ess of identification with certain of these per sons who were taken as a model

These are some of the results yielded by the application of psycho analysis to the narcis

... c disorders. They are still not very numer ous a d many of them still la k that harpness of outline which cannot be achieved in a new field until some degree of familiarity has been attained. All of them have been made pos ble by employin the conception of e o- libido or narcissistic lib do by means f which we can extend the conclusions established for the transference neuroses o to the narcissistic euroses But now you will put the question whether it is po sible f r us to bring all the disorders of the narcis tic neuroses and of the psychoses into the range of the lib do theory for us to find th lib dinal f ct in mental life alwa s a d everywhere respo ble for the development of disease and for us never to have to attribute any part in the cau sation to the ame alteration in the functions of the elf-preservative instincts Well now it seems t me that d cision on this point is not very urgent, and bo e all that the time is not yet ripe for us to mak t we may lea e it calmly to be d cided by ad ance in the work of science. I hould ot be astonished if it would prove that the capa ty t ndu e a pathogenic eff ct were actually a prerogative of th libidinal mpul es o that th theory of the lib do would triumph all al n the line from the ctual euroses to th severest psy chot f rm f indi dual d rang m t For we know t to be characteristic of the lib d that t refuses t bordinate tself to reality n lif to eces ty B t I cons d t extremely probabl that the ego-instincts are in l ed secondarily and that di tu bances in th func tions may be ecessitat d by the path enic affections f the l'b d Nor can I see that the direction taken by our investigations will be invalidated f we h uld ha e to recogniz that in severe psychosis the go nstincts th msel es re primarily deranged the future will decide —f r you, t lea t.

Let me return for m ment to anxiety in or r to throw li ht po the one obscure point we l ft there W sa d that th relat on be tween anxiety and lib d otherwise so well de fi ed, is with difficulty harmonized w th the almost indisputable a sumpt that object e anxiety in the fa of da g r is the expres on of the self-preservative i stincts B t how if the anxiety affect is p ovided not by self n terest on th part of the ego-instincts but by the ego-lib d The cond't n of anx ty is afte all invariably detrimental ts disad vanta e becomes consp cuous wh it reaches an intense degree. It then interf res with th action that alone would be expedient and would serve the purposes of self preservat on whether it be flight or self-defence Therefore if we ascribe the affecti e compo ent of objecti e anxiety to the ego-lib do and the action under — every will away *because* we perce e fear? No we pe cei e fear *and* we take to fl ght out of the common impulse that is roused by the perception of — — ed ... es of lid —

fo instance pointed their gun at the o com n beast—which was undoubtedly the best thing they c uld do

TWENTY SEVENTH LECTURE

TRANSFERENCE

Now that we are comin t the end of our dis cuss ons you will feel a certain expectat on which must not be allowed to mislead you You are probably thinking that I su ely have not led you through all these complicated mazes of psycho-analysis only to d smiss you at the end without a word about the therapy upon which aft r all the possib'lity of undertaking psycho-analytic work depe ds As a matter of fact I could not poss'bly lea out this aspect of it for some of the phenomena belonging to it will teach you a new fact without knowledge of which you would be quite unable to a simi late properly your understa d ng of the d s- ea es we have been studying

I know you do not expect directions in the te hnique of pract ing analys s for therapeutic purpo e you only want to know in a general way by what means the psy ho-analyt c the apy wo ks and to ga a g ral idea of what it omplı hes And y u ha e an undeniable right to learn this everthele s I am n t going to t ll y u—I am g ing t insi t upon your finding out fo y rsel es

Think for a moment You have l eady learnt everythi g essential fr m the o dit ns by wh h illnes is p o oked to all the f ctors which tak effect w thin the d ea d mind Where is the penin in all this for therapeut c influ n e? First f ll there is the he ed tary dispo t n—w do n t often ment n t be caus it o tro gly emphasized oth r quarters d w ha noth g new t v bout it B t do t suppose that w u d restim te it as practiti rs we are w ll aware *of its*

power In any event we can do nothing to change it for us also it is a fixed datum in the problem which sets a limit to our efforts Next there is the influence of the experiences of childhood which we are accustomed in analysis to rank as very important they belong to the past we cannot undo them Then there is all that unhappiness in life which we have included under *frustration in reality* from which all the absence of love in life proceeds—namely poverty family strife mistaken choice in marriage unfavourable social conditions and the severity of the demands by which moral convention oppresses the individual There is indeed a wide opening for a very effective treatment in all this but it would have to follow the course of the dispensations of Kaiser Joseph in the Viennese legend—the benevolent despotism of a potentate before whose will men bow and difficulties disappear! But who are we that we can exert such beneficence as a therapeutic measure? Poor as we are and without influence socially with our living to earn by our medical practice we are not even in a position to extend our efforts to penniless folk as other physicians with other methods can do our treatment takes too much time and labour for that But perhaps you are still clinging on to one of the factors put forward and believe you see an opening for our influence there If the conventional restrictions imposed by society have had a part in the privations forced upon the patient the treatment could give him the courage and even directly advise him to defy these obstacles and to seize satisfactions and health for him elf at the cost of failing to achieve an ideal which though highly esteemed is after all often set at nau ht by the world Health is to be won by free living then There would be this blot upon analysis to be sure that it would not be serving general morality what it gave to the individual it would take from the rest of the world

But now who has given you such a false impression of analysis? It is out of the question that part of the analytic treatment should consist of advice to live freely —if for no other reason because we ourselves tell you that a stubborn conflict is going on in the patient between libidinal desires and sexual repression between sensual and ascetic tendencies This conflict is not resolved by helping one side to win a victory over the other It is true we see that in neurotics ascetism has gained the day the result of which is that the suppres ed sexual impulses have found a vent for themselves in the symptoms If we were to make victory possible to the sensual side instead the disregarded forces repressing sexuality would have to indemnify themselves by symptoms Neither of these measures will succeed in ending the inner conflict one side in either event will remain unsatisfied There are but few cases in which the conflict is so unstable that a factor like medical advice can have any effect upon it and these cases do not really require analytic treatment People who can be so easily influenced by physicians would have found their own way to that solution without this influence After all you know that a young man livin in abstinence who makes up his mind to illicit sexual intercourse or an unsatisfied wife who seeks compensation with a lover does not as a rule wait for the permission of a physician still less of an analyst to do so

In considering this question people usually overlook the essential point of the whole difficulty—namely that the pathogenic conflict in a neurotic must not be confounded with a normal struggle between conflictin impulses all of which are in the same mental field It is a battle between two forces of which one has succeeded in coming to the level of the preconscious and conscious part of the mind while the other has been confined on the unconscious level That is why the conflict can never have a final outcome one way or the other the antagonists meet each other as little as the whale and the polar bear in the well known story An effective decision can be reached only when they confront each other on the same ground And in my opinion to accomplish this is the sole task of the treatment

Besides this I can assure you that you are quite misinformed if you imagine that advice and guidance concerning conduct in life forms an integral part of the analytic method On the contrary so far as possible we refrain from playing the part of mentor we want nothin better than that the patient should find his own solutions for himself To this end we expect him to postpone all vital decisions affecting his life such as choice of career business enterprises marriage or divorce during treatment and to execute them only after it has been completed Now confess that you had imagined something very different Only with certain very young or quite helple s and defenceless persons is it impossible to keep within such strict limitations as we should wi h With them we have to combine the positions of physician and educator we are then well aware of

our responsibility and ct with the necessary
r tion

influence them in f our of con entional lio-
n That is at lea t s far removed from
ur purpose as the other We are not reformers
it is tr we are merely observers but we
cannot oid observing with critical eyes and
have found t imposs bl to give ou support
t conventional sexual morality o to appro e
highly f the means by which soci t attempts
to arrange the practical prob ems of sexuality
in life We can dem nstrate with ease that what
the world calls its ode of morals demands
more sacrifices than it is worth, and that its
beha iour is ne ther dictated by ho esty nor
instituted with wisdom. We d not absol e our
patients from listening to these crit cisms we
accus m them to an unprej diced considera
tion of sexual matters like all other matters
and if after they ha e be om indepe dent by
the effect of th treatment they choose some
intermediate course between unrestrained sex
ual licence and unco ditional a cet ism our
conscience is n t burdened whatever the out
come. W say to oursel es that anyone who
has successfully undergon the training of
learning and recognizing the truth about him
self is hencef rth strengthened gainst the
dangers f immorality even f his tandard of
morality should in som respect deviat from
the common ne Incidentally we must beware
of ov restim tin the importance f ab tinence
in a ctin neurosis only min rity of patho-
genic s uations d e to fru tration nd the ub-
sequent accum atu of lib do th reby induced
can be relieved by the kind of sexual inter
course that is procurable without any difficulty

So you can t explain the therapeutic effect
f psycho-analysis by upposing that t permits
pa ient free sexual indulge ce you must look
round for somethi lse I think that f
the emarks I made while I was disposin of
this conjecture on you part will ha e put you
on the ri ht tra k. Probably t is the substit
tion of something onscious for something un
onscious the transformati f th un on
scious thought into consci us thoughts that
makes our w k ffecti e You are right that
is exactly what it is By ext ending the un on
scious int co sciousne s th repressi ns are
raised the conditi of symptom format on
are abolished and the pathogenic c flict ex

changed for a normal one which must be de-
cided o e way or the other We do nothi for
our patients but enabl this one mental cha e
to take place in them the extent to which it
is achieved is the extent of the benefit we do
them Where th re is no repression or ment l
process a alogous to it to be undone there is
n thing for our therapy to do

Th aim of o r efforts may be expressed in
various formulas—m king conscious the un
con cious remo ing the repre ns filling in
the gaps in mem ry they all amount to the
same thi But perhaps ou are di satisfied
with this declaration you imagined the recov
ery of a nervous perso rather di erently that
after he had been bjected to the laborious
process f psycho-anal sis he would emerge a
different person altogether and then you hear
that th whole thi only amounts to his ha ing
a little less that is unconsc ous and a little more
that is con cious in him than before Well you
probably do not appreciate the importanc of
an inner change of this kind A neurotic who
has been cured has really become a different
person although at bottom of course he re
mains th same—that is he has bec me his
best self what he would ha e been under the
most favourabl c ditions That howe er is
a great deal. Then when ou hear of all that
has to be done of the tremendous xerti n
required to carry o t this apparently trifling
change in his mental life the significance at
tached to these differences between the various
mental levels will appear more comprehens ble
t you

I will digress a moment to enquire wh ther
l Th

i

caus f the illness Now is psycho-analysis a
causal therapy not? The answ r s t a im
ple one, but t may give us an opportunity to
convince ourselves f the futili y of such ques
tions In o far as psycho-analytic therapy does
not aim immedi t ly t removin the sympt ms
t is cond cted like a causal therapy In oth r
respects you may say it is not for we ha e
fol wed the ca sal chain back fa bey nd the
repressions to the instincti e predispos tions
th relative inte ty th c nstitut on d
th berrations in th course f their develop-
men Now suppose tha it were pos bl by
some chemical means to ffect this mental
machin ry t increase r decrease the amount
of lib do ailable t any gi en mom n or to

reinforce the strength of one impulse at the expense of another—that would be a causal therapy in the literal sense and our analysis would be the indispensable preliminary work of reconnoitring the ground As you know there is at present no question of any such influence upon the processes of the libido our mental therapy makes its attack at another point in the concatenation not quite at the place where we perceive the manifestations to be rooted but yet comparatively far behind the symptoms themselves at a place which becomes accessible to us in very remarkable circumstances

What then have we to do in order to bring what is unconscious in the patient into consciousness? At one time we thought that would be very simple all we need do would be to identify this unconscious matter and then tell the patient what it was However we know already that that was a short sighted mistake Our knowledge of what is unconscious in him is not equivalent to his knowledge of it when we tell him what we know he does not assimilate it *in place of* his own unconscious thoughts but *alongside* of them and very little has been changed We have rather to regard this unconscious material topographically we have to look for it in his memory at the actual spot where the repression of it originally ensued This repression must be removed and then the substitution of conscious thou ht for unconscious thought can be effected straightway How is a repre sion such as this to be removed? Our work enters upon a second phase here first the discovery of the repression and then the removal of the resistance which maintains this repression

How can this resistance be got rid of? In the same way by finding it out and telling the patient about it The resistance too arises in a repression either from the very one which we are endeavouring to dispel or in one that occurred earlier It is set up by the counter charge which rose up to repress the repellent impulse So that we now do just the same as we were trying to do before we interpret identify and inform the patient but this time we are doing it at the right spot The counter charge or the resistance is not part of the unconscious but of the ego which co operates with us and this is so even if it is not actually conscious We know that a difficulty arises here in the ambiguity of the word *u iconscious* on the one hand as a phenomenon on the other hand as a system That sounds very obscure and difficult but after all it is only a repetition of what we have said before is it not? We have come to this point already long ago Well then we expect that this resistance will be abandoned and the counter-charge withdrawn when we have made the recognition of them possible by our work of interpretation What are the instinctive propelling forces at our disposal to make this possible? First the patient s desire for recovery which impelled him to submit himself to the work in co operation with us and secondly the aid of his intelli ence which we reinforce by our interpretation There is no doubt that it is easier for the patient to recognize the resistance with his intelligence and to identify the idea in his unconscious which corresponds to it if we have first given him an idea which rouses his expectations in regard to it If I say to you Look up at the sky and you will see a balloon you will find it much more quickly than if I merely tell you to look up and see whether you can see anything a student who looks through a microscope for the first time is told by the instructor what he is to see otherwise he ees nothing although it is there and quite visible

And now for the fact! In quite a number of the various forms of nervous illness in the hysterias anxiety conditions obsessional neuroses our hypothesis proves sound By seeking out the repression in this way discovering the resistances indicating the repressed it is actually possible to accomplish the task to overcome the resistances to break down the repression and to change something unconscious into something conscious As we do this we get a vivid impression of how as each individual resistance is being mastered a violent battle goes on in the soul of the patient—a normal mental struggle between two tendencies on the same ground between the motives striving to maintain the counter charge and those which are ready to abolish it The first of these are the old motives which originally erected the repression among the second are found new ones more recently acquired which it is hoped will decide the conflict in our favour We have succeeded in revivifying the old battle of the repression again in bringing the issue so long ago decided up for revision again The new contribution we make to it lies first of all in demonstrating that the original solution led to illness and in promising that a d fferent one would pave the wav to health and secondly in pointing out that the circumstances have all changed immen ely since the time of that orig

ral repudiation of these impulses Then the ego was weak infantile and perhaps had rea on to hrink with horror f om the claims of th Ei d as being darge ous to t Today it i st ong and experie ced and moreover has a helpe at hand in the physi ian So we may expect to lead the rev ed conflict through a better t ome than repres i n a d as has been said, in hyst ria anxiety eu os s and th bses onal neuro is cce s in the main justi fies our claims.

There are ther forms of illness however with which our therapeutic treatment never is succes ful in sp te f the similarity of th c n ditions. I them also the was originally a conflict between ego and lib d leading to repres on—alth gh this c flict m y be char c terized by topographical differe ces from the conflict of th transf rence euroses in them too it is pos ble t trac out the point in the pa ent s lif t whi h th repress ons ccurred we apply the same method re ready to make t same assura ces ffer the same ta ce b telling th patie t what t look out for d here al the interval in tim between the pres en and the point t which the repressions were est blished is all in fa of bette outc me of the co flict. And yet we cannot s cceed in ov rcoming o e re tanc r in removi g e f the repress io s Thes pat ent para oiacs melanch lics and th se s ff ring from demen ta p aec x, emai on th wh le un ffected proof against psycho- nalytic t eatment. What can be th ca se f this? It is ot d t lack f in elligence a c rtain d gree f tellectual capacity must nat rally be t pulated fo anal ysis, but there is o d fi ency in this respect m, f stan e the very quick witt d ded c tn paranoi N any f th oth p o pelling f es regularly absent m lancholics for instance in ontra t to paran iacs experi enc a very high degree f ealization th t they are ill and that the r uff ri gs are du to thi but they re not on that ac ount any m re a es bl t in ence I th w e con fro ted with a f ct that w d ot understand a d re theref re called upo to d bt whether we ha e really understood all th ditı n of t e succes pos bl w th th ther neu oses

When w keep to on d ration of hysterical and obsessional eu t cs we are very oon o f ted with a sec d f t f which we were quite unprepared. After the treatment ha proceeded for a whil we tice that these patients be ave in qu t peculi man er tow rds our sel es We th ught indeed that w had taken into a count all the moti e forces affecting the treatment and had reas ned out the s tuation between oursel es and the patient fully so that it balanced like a sum in arithmetic and then after all something seems to sl p n which was quite left o t of our calculation This new and unexpected feature s in tself many s ded and complex I will first of all describe some of its mor frequent and simpl r forms to you

We observe the that the patient who ou ht t be thi ki g of nothing but the olution of his own di tressing co flicts begins to develop a particular nterest in the person of the phy s cian E erything co nected with this person seems to him more important than his own aff irs a d to d tract him f om his illness Relations with th pati nt then become for a time very agreeabl he s particularly docile e dea rs to show his gratitud wherever he ca exhib ts a fi ess of charact r and other good qual t es which we had perhaps not an t c pated in him The nalyst thus forms a very good op n of th patient and value his luck in be g able to render assistance to u h an adm rable perso al ty If the phy cia has oc ca on to see the patie t s relati es he hears with satisf ct on that this esteem mut l Th patie t at hom i never ti ed of praising the nalyst and attributing n w virtues to him

th way he ne r speaks of anything but you he quotes you all the time

We will h pe that the physician is modest enou h to ascribe the pat ent s estim te of his val e to the hopes f co ery which he has bee ble t offe to him and t the widening in th patient s intell tual h riz n c nsequent upon the surprising evelat ns e tailed by the treatment d th r liberati g influence Th analys t o makes ple did p gress unde these co ditions th patie t understands the s gg tions ffered to him conc trates upon the tasks appointed by the treatment the ma teri l eeded—his re llect on and ociations —is abunda tly a ailabl he astonishes the analyst by the urenes and accuracy of his int rpretati ns and the latte has o ly t bserve w th satisf ctio how read ly and will ingly a sick man will ccept ll th new psy hological ideas that are hotly c tested by the healthy in th wo ld outs d A g ral m provement in th patient s conditi objec

tively confirmed on all sides also accompanies thi harmonious relationship in the analysis

But such fair weather cannot last for ever There comes a day when it clouds over There begin to be difficulties in the analysis the patient says he cannot think of anything more to say One has an unmistakable impression that he is no longer interested in the work and that he is casually ignoring the injunction given him to say everything that comes into his mind and to yield to none of the critical objections that occur to him His behaviour is not dictated by the situation of the treatment it is as if he had not made an agreement to that effect with the physician he is obviously preoccupied with something which at the same time he wishes to reserve to himself This is a situation in which the treatment is in danger Plainly a very powerful resistance has risen up What can have happened?

If it is possible to clear up this state of things the cause of the dist h [illegible] I

I [illegible] accounted for by the latter's behaviour nor by the relationship involved by the treatment The form in which this affectionate feeling is expressed and the goal it seeks naturally depend upon the circumstances of the situation between the two persons If one of them is a young girl and the other still a fairly young man the impression received is that of normal love it seems natural that a girl should fall in love with a man with whom she is much alone and can speak of very intimate things and who is in the position of an adviser with authority—we shall probably overlook the fact that in a neurotic girl some disturbance of the capacity for love is rather to be expected The farther removed the situation between the two persons is from this supposed example the more unaccountable it is to find that nevertheless the same kind of feeling comes to light in other cases It may be still comprehensible when a young woman who is unhappily married seems to be overwhelmed by a serious passion for her physician if he is still unattached and that she should be ready to eek a divorce and give herself to him or where circumstances would prevent this to enter into a secret love affair with him That sort of thing indeed is known to occur outside psycho analysis But in this situation girls and women make the most astonishing confessions which reveal a quite peculiar attitude on their part to the therapeutic problem they had

a] t t a [illegible] them what life had so far denied them It was only with this hope that they had taken such pains over the analysis and had conquered all their difficulties in disclosing their thoughts We ourselves can add and had understood so easily all that is usually so hard to accept But a confession of this kind astounds us all our calculations are blown to the winds Could it be that we have omitted the most important element in th whole problem?

And actually it is so the more experience we gain the less possible does it become for us to contest this new factor which alters the whole problem and puts our scientific calculations to shame The first few times one might think that the analytic treatment had stumbled upon an obstruction in the shape of an accidental occurrence extraneous to its purpose and unconnected with it in origin But when it happens that this kind of attachment to the physician regularly evinces itself in every fresh case under the most unfavourable conditions and always appears even in circumstances of a positively grotesque incongruity—in elderly women in relation to grey bearded men even on occasions when our judgment assures us that no temptations exist—then we are compelled to give up the idea of a disturbing accident and to admit that we have to deal with a phenomenon in itself essentially bound up with the nature of the disease

The new fact which we are thus unwillingly compelled to recognize we call *transference* By this we mean a transference of feelings on to the person of the physician because we do not believe that the situation in the treatment can account for the origin of such feelings We are much more disposed to suspect that the whole of this readiness to develop feeling originates in another source that it was previously formed in the patient and has seized the opportunity provided by the treatment to transfer itself on to the person of the physician The transference can express itself as a passionate petitioning for love or it can take less extreme forms where a young girl and an elderly man are concerned instead of the wish to be wife or mistress a wish to be adopted as a favourite daughter may come to light the libidinous desire can modify itself and propose itself as a wish for an everlasting but ideally platonic friendship Many women understand how to

sublimate the transference and to mould it until it acquires a sort of justification for its existence others have to express it in its crude, almost impossible form. But a bottom it is always the same and its origin in the same source can never be mistaken.

Before we enquire where we are to range this new fact, we will amplify the description of it a little. How is it with our male patients? There at least we might hope to be spared the troublesome element of sex difference and sex attraction. Well, the answer is very much the same as with women. The same attachment to the physician, the same overestimation of his qualities, the same adoption of his interests, the same jealousy against all those connected with him. The sublimated kinds of transference are the forms more frequently met with between man and man, and the directly sexual declaration more rarely in the same degree to which the manifest homosexuality of the patient is subordinated to the other ways by which this component instinct can express itself. Also it is in male patients that the analyst more frequently observes a manifestation of the transference which at the first glance seems to controvert the description of it just given—that is, the hostile or *negative* transference.

First of all, let us realize at once that the transference exists in the patient from the beginning of the treatment, and is for a time the strongest impetus in the work. Nothing is seen of it and one does not need to trouble about it as long as its effect is favourable to the work in which the two persons are co-operating. When it becomes transformed into a resistance attention must be paid to it and then it appears that the two different and contrasting states I mind have supervened in it and have altered its attitude to the treatment: first, when the affectionate attraction has become so strong and betrays its origin in sexual desure so clearly that it was bound to arouse an inner opposition against itself and secondly when it consists in antagonistic instead of affectionate feeling. The hostile feelings as a rule appear later than the affectionate and under cover of them; when both occur simultaneously they provide a very good exemplification of that ambivalence in feeling which governs most of our intimate relationships with other human beings. The hostile feelings therefore indicate an attachment of feeling quite similar to the affectionate just as defiance indicates a similar dependence upon the other person to that belonging to obedience though with a reversed

prefix. There can be no doubt that the hostile feelings against the analyst deserve *the name of transference* for the situation in the treatment certainly gives no adequate occasion for them; the necessity for regarding the negative transference in this light is a confirmation of our previous similar view of the positive or affectionate variety.

Where the transference springs from, what difficulties it provides for us, how we can overcome them and what advantage we can finally derive from it, are questions which can only be adequately dealt with in a technical exposition of the analytic method. I can merely touch upon them here. It is out of the question that we should yield to the demands made by the patient under the influence of his transference; it would be nonsensical to reject them unkindly and still more so indignantly. The transference is overcome by showing the patient that his feelings do not originate in the current situation, and do not really concern the person of the physician, but that he is reproducing something that had happened to him long ago. In this way we require him to transform his *repetition* into *recollection*. Then the transference which, whether affectionate or hostile, every time seemed the greatest menace to the cure becomes its best instrument so that with its help we can unlock the closed doors in the soul. I should like, however, to say a few words to dispel the unpleasant effects of the shock that this unexpected phenomenon must have been to you. After all, we must not forget that this illness of the patient's which we undertake to analyse is not a finally accomplished and, as it were consolidated thing but that it is growing and continuing its development all the time like a living thing. The beginning of the treatment puts no stop to this development, but as soon as the treatment has taken a hold upon the patient, it appears that the entire productivity of the illness henceforward becomes concentrated in one direction—namely upon the relationship to the physician. The transference then becomes comparable to the cambium layer between the wood and the bark of a tree from which proceeds the formation of new tissue and the growth of the trunk in diameter. As soon as the transference has taken on this significance the work upon the patient's recollections recedes far into the background. It is then not incorrect to say that we no longer have to do with the previous illness but with a newly created and transformed neurosis which has replaced the earlier one. This new edition

of the old disease has been followed from its inception one sees it come to light and grow and is particularly familiar with it since one is oneself its central object All the patient s symptoms have abandoned their original significance and have adapted themselves to a new meaning which is contained in their relationship to the transference or else only those symptoms remain which were capable of bein adapted in this way The conquest of this new artificially acquired neurosis coincides with the removal of the illness which existed prior to the treatment that is with accomplishing the therapeutic task The person who has become normal and free from the influence of repressed instinctive tendencies in his relationship to the physician remains so in his own life when the physician has again been removed from it

The transference has this all important absolutely central significance for the cure in hysteria anxiety hysteria and the obsessional neurosis which are in consequence rightly grouped together as the *transference neuroses* Anyone who has grasped from analytic experience a true impression of the fact of transference can never again doubt the nature of the suppressed impulses which have manufactured an outlet for themselves in the symptoms and he will require no stronger proof of their libidinal character We may say that our conviction of the significance of the symptoms as a substitutive gratification of the libido was only finally and definitely established by evaluating the phenomenon of transference

Now however we are called upon to correct our former dynamic conception of the process of cure and to bring it into agreement with the new discovery When the patient has to fight out the normal conflict with the resistances which we have discovered in him by analysis he requires a powerful propelling force to influence him towards the decision we aim at leading to recovery Otherwise it might happen that he would decide for a repetition of the previous outcome and allow that which had been raised into consciousness to slip back again under repression The outcome in this struggle is not decided by his intellectual insight—it is neither strong enough nor free enou h to accomplish such a thing—but solely by his relationship to the physician In so far as his transference bears the positive sign it clothes the physician with authority transforms itself into faith in his findings and in his views Without this kind of transference or with a negative one the physician and his arguments would never even be listened to Faith repeats the history of its own origin it is a derivative of love and at first it needed no arguments Not until later does it admit them so far as to take them into critical consideration if they have been offered by someone who is loved. Without this support arguments have no wei ht with the patient never do have any with most people in life A human being is therefore on the whole only accessible to influence even on the intellectual side in so far as he is capable of investing objects with libido and we have good cause to reco nize and to fear in the measure of his narcissism a barrier to his susceptibility to influence even by the best analytic technique

The capacity for the radiation of libido towards other persons in object investment mu t of course be ascribed to all normal people the tendency to transference in neurotics so called is only an exceptional intensification o' a universal characteristic Now it would b very remarkable if a human character trait o this importance and universality had never been observed and made use of And this has really been done Bernheim with unerring perspicacity based the theory of hypnotic manifestations upon h

more

What

but the tendency to transference rather too narrowly circumscribed so that the negative transference did not come within its cope But Bernheim could never say what suggestion actually was nor how it arises it was an axiomatic fact to him and he could give no explanation of its origin He did not recognize the dependence of *suggestibility* on sexuality on the functioning of the libido And we have to admit that we have only abandoned hypnosis in our methods in order to discover suggestion again in the shape of transference

But now I will pause and let you take up the thread I observe that an objection is invading your thoughts with such violence that it would deprive you of all power of attention if it were not given expression So now at last you have confessed that you too work with the aid of suggestion like the hypnotists We have been thinkin so all along But then what is the use of all these round about routes by way of past experiences d scovering the unconscious material interpreting and retranslating the d stortions and the enormous expenditure of time trouble and money when after all

the only effective agent is suggestion Why do you not suggest directly against the symptoms, as others do who are honest hypnotists And besides if you are going to make out that by these round-about routes you have made numerous important psychological discoveries, which are concealed in direct suggestion who is to vouch for the validity Are not they too the result of suggestion of unintentional suggestion, that is? Can not you impress upon the patient what you please and whatever seems good to you in this direction also

What you charge me with in this way is exceedingly interesting and must be answered. But I cannot do that today our time is up Till next time then. You will see that I shall be answerable to you. Today I must finish what I began. I promised to explain to you, through the factor of transference why it is that our therapeutic efforts have no success in the narcissistic neuroses

I can do it in a few words and you will see how simply the riddle is solved, and how well everything fits together Experience shows that persons suffering from the narcissistic neuroses have capacity for transference only insufficient remnants of it. They turn from the physician not in hostility but in indifference. Therefore they are not to be influenced by him what he says leaves them cold makes no impression on them, and therefore the process of cure which can be carried through with others the revivification of the pathogenic conflict and the overcoming of the resistance due to the repressions cannot be effected with them. They remain as they are They have often enough undertaken attempts at recovery on their own account which have led to pathological results we can do nothing to alter this

On the basis of our clinical observations of these patients we stated that they must have abandoned the investment of objects with libido and transformed object-libido into ego-libido By this we differentiated them from the first group of neuroses (hysteria, anxiety and obsessional neurosis) Their behavior during the attempt to cure them confirms this suspicion. They produce no transference and are therefore ma es he t our rts not to be cured by us.

TWENTY EIGHTH LECTURE

The Analytic Therapy

You know what we are going to discuss today When I admitted that the influence of the psycho-analytic therapy is essentially founded upon transference i.e., upon suggestion you asked me why we do not make use of direct suggestion, and you linked this up with a doubt whether in view of the fact that suggestion plays such a large part, we can still vouch for the objectivity of our psychological discoveries I promised to give you a comprehensive answer

Direct suggestion is suggestion delivered directly against the forms taken by the symptoms a struggle between your authority and the motives underlying the disease In this struggle you do not trouble yourself about *these motives you only require the patient to* suppress the manifestation of them in the form of symptoms. In the main it makes no difference whether you place the patient under hypnosis or not. Bernheim with his characteristic acuteness repeatedly stated that suggestion was the essence of the manifestations of hypnotism, and that hypnosis itself was already a result of suggestion, a suggested condition he preferred to use suggestion in the waking state which can achieve the same results in hypnosis.

Now which shall I take first, the results of experience or theoretical considerations

Let us begin with experience. I sought out Bernheim in Nancy in 1889 and became a pupil of his I translated his book on suggestion into German. For years I made use of hypnotic treatment, first with prohibitory suggestions and later combined with Breuer's system of the fullest inquiry into the patient's life I can therefore speak from wide experience about the results of the hypnotic or suggestive therapy According to an old medical saying an ideal therapy should be rapid reliable and not disagreeable to the patient Bernheim's method certainly fulfilled two of these requirements It was much more rapid, that is incomparably more rapid in its course than the analytic, and it involved the patient in no trouble or discomfort. For the physician, it eventually became monotonous it meant treating every case in the same way always employing the same ritual to prohibit the existence of the most diverse symptoms without being able to grasp anything of their meaning or significance It was a sort of mechanical drudgery—hodman's work—not scientific work it was reminiscent of magic conjuring and hocus-pocus, yet in the patient's interests had to ignore that. In the third desideratum however it failed was not reliable in any respect. It could be

of the old disease has been followed from its inception one sees it come to light and grow and is particularly familiar with it since one is oneself its central object All the patient s symptoms have abandoned their original sig nificance and have adapted themselves to a new meaning which is contained in their re lationship to the transference or else only those symptoms remain which were capable of bein adapted in this way The conquest of this new artificially acquired neurosis coincides with the removal of the illness which existed prior to the treatment that is with accomplishing the therapeutic task The person who has be come normal and free from the influence of repressed instinctive tendencies in his relation ship to the physician remains so in his own life when the physician has again been removed from it

The transference has this all important ab solutely central significance for the cure in hysteria anxiety hysteria and the obsessional neurosis which are in consequence ri htly grouped together as the *transference neuroses* Anyone who has grasped from analytic experi ence a true impression of the fact of transfer ence can never again doubt the nature of the suppressed impulses which have manufactured an outlet for themselves in the symptoms and he will require no stronger proof of their libid inal character We may say that our conviction of the significance of the symptoms as a sub stitutive gratification of the libido was only finally and definitely established by evaluating the phenomenon of transference

Now however we are called upon to correct our former dynamic conception of the process of cure and to bring it into a reement with the new discovery When the patient has to fight out the normal conflict with the resistances which we have discovered in him by analysis he requires a powerful propelling force to in fluence him towards the decision we aim at leading to recovery Otherwise it might happen that he would decide for a repetition of the previous outcome and allow that which had been raised into consciousness to slip back again under repression The outcome in this struggle is not decided by his intellectual in sight—it is neither strong enough nor free enough to accomplish such a thing—but solely by his relationship to the physician In so far as his transference bears the positive sign it clothes the physician with authority transforms itself into faith in his findings and in his views Without this kind of transference or with a ne ative one the physician and his arguments would never even be listened to Faith repeats the history of its own origin it is a derivative of love and at first it needed no arguments Not until later does it admit them so far as to take them into critical consideration if they have been offered by someone who i loved Without this support arguments have no wei ht with the patient never do have any with most people in life A human being is therefore on the whole only accessible to influence even on the intellectual side in so far as he is capable of investing objects with libido and we have good cause to recognize and to fear in the measure of his narcissism a barrier to his sus ceptibility to influence even by the best ana lytic technique

The capacity for the radiation of libido to wards other persons in object investment must of course be ascribed to all normal people the tendency to transference in neurotics so called is only an exceptional intensification of a universal characteristic Now it would be very remarkable if a human character trait of this importance and universality had never been observed and made use of And this has really been done Bernheim with unerring perspicacity based the theory of hypnotic manifestations upon the proposition that all human beings are more or less open to suggestion are *suggestible* What he called *suggestibility* is nothing else but the tendency to transference rather too narrowly circumscribed so that the negative transference did not come within its scope But Bernheim could never say what suggestion actually was nor how it arises it was an axi omatic fact to him and he could give no ex planation of its origin He did not recognize the dependence of *suggestibility* on sexuality on the functionin of the libido And we have to admit that we have only abandoned hypnosis in our methods in order to discover suggestion again in the shape of transference

But now I will pause and let you take up the thread I observe that an objection is in vading your thoughts with such violence that it would deprive you of all power of attention if it were not given expression So now at last you have confessed that you too work with the aid of suggestion like the hypnotists We have been thinking so all along But then what is the use of all these round about routes by way of past experiences discovering the uncon scious material interpreting and retran lating the distortions and the enormous expenditure of time trouble and money when after all

Not until after the transference has been ... resolved can one begin to reconstruct in the ... the dispositions of the libido that were possessed by the illness.

In the light of the libido theory there is a final word to be said about dreams. The dreams of neurotics, like their errors and their free associations, ... us to find the meaning of the symptoms and to discover the dispositions of the libido. They ... forms taken by the wish-fulfilment ... in them show us what are the wishes that have undergone repression, and what are the objects to which the libido has attached itself after withdrawal from the ego. The interpretation of dreams therefore plays a great part in psycho-analytic treatment, and in many cases it is for lengthy periods the most important instrument at work. We already know that the condition of sleep in itself produces a certain relaxation of the repressions. By this diminution in the heavy pressure upon it, the repressed desire is able to create for itself far clearer expression in a dream than can be permitted to it by day in the symptom. Hence the study of dreams becomes the easiest approach to a knowledge of the repressed unconscious which is where the libido which has withdrawn from the ego belongs.

The dreams of neurotics, however, differ in no essential from those of normal people; they are indeed perhaps not in any way distinguishable from them. It would be illogical to account for the dreams of neurotics in a way that would not also hold good of the dreams of normal persons. We have to conclude, therefore, that the difference between neurosis and health prevails only by day; it is not sustained in dream life. It thus becomes necessary to transfer to healthy persons a number of conclusions arrived at as a result of the connections between the dreams and the symptoms of neurotics. We have to recognize that the healthy man as well possesses those factors in mental life which alone can bring about the formation of a dream or of a symptom, and we must conclude further that the healthy also have instituted repressions and have to expend a certain amount of energy to maintain them; that their unconscious minds too harbour repressed impulses which are still suffused with energy, and that *a part of the libido is in them also withdrawn from the ego*. The healthy man, too, is therefore virtually a neurotic, but the only symptom that he seems capable of developing is a dream. To be sure, when you subject his waking life also to critical investigation, you discover something that contradicts this specious conclusion, for this apparently healthy life is pervaded by innumerable trivial and practically unimportant symptom-formations.

The difference between nervous health and nervous illness (neurosis) is narrowed down therefore to a practical distinction, and is determined by the practical result—how far the person concerned remains capable of a sufficient degree of capacity for enjoyment and active achievement in life. The difference can probably be traced back to the proportion of the energy which has remained free relative to that of the energy which has been bound by repression, i.e., it is a quantitative and not a qualitative difference. I do not need to remind you that this view provides a theoretical basis for our conviction that the neuroses are essentially amenable to cure, in spite of their being based on a constitutional disposition.

So much, therefore, in the way of knowledge of the characteristics of health may be inferred from the identity of the dreams dreamt by neurotic and by healthy persons. Of dreams themselves, however, a further inference must be drawn—namely, that it is not possible to detach them from their connection with neurotic symptoms; that we are not at liberty to believe that their essential nature is exhausted by compressing them into the formula of a *translation of thoughts into archaic forms of expression*; and that we are bound to conclude that they disclose dispositions of the libido and objects of desire which are actually in operation and valid at the moment.

We have now come very nearly to the end. Perhaps you are disappointed that, under the heading of psycho-analytic therapy, I have limited myself to theory and have told you nothing of the conditions under which the cure is undertaken, or of the results it achieves. I omit both, however: the first, because in fact I *never intended* to give you a practical training in the exercise of the analytic method; and the last, because I have several motives against it. At the beginning of these discussions I said emphatically that under favourable conditions we achieve cures that are in no way inferior to the most brilliant in other fields of medical therapy. I may perhaps add that these results could be achieved by no other method. If I said more I should be suspected of wishing to drown the deprecatory voices of our opponents by self-advertisement. Medical colleagues have, even at public congresses, repeatedly held

between his ego and his libido came to an end and if his ego again had the libido at its dis posal The task of the treatment therefore consists in the task of loosening th [illegible]

[illegible] the libido of a neurotic? Easily found it is attached to the symptoms which offer it the substitutive satis faction that is all it can obtain as things are We must master the symptoms then dissolve them—just what the patient asks of us In or der to dissolve the symptoms it is necessary to go back to the point at which they originated to review the conflict from which they proceed ed and with the help of propelling forces which at that time were not available to guide it to wards a new solution This revision of the process of repression can only partially be ef fected by means of the memory traces of the processes which led up to repression The de cisive part of the work is carried through by creating—in the relationship to the physician in the *transference*—new editions of those early conflicts in which the patient strives to behave as he originally behaved while one calls upon all the available forces in his soul to bring him to another decision The transference is thus the battlefield where all the contending forces must meet

All the libido and the full strength of the opposition against it are concentrated upon the one thing upon the relationship to the phy sician thus it becomes inevitable that the symptoms should be deprived of their libido in place of the patient s original illness appears the artificially acquired transference the trans ference disorder in place of a variety of un real objects of his libido appears the one object also *phantastic* of the person of the physician This new struggle which arises concerning this object is by means of the analyst s suggestions lifted to the surface to the higher mental levels and there worked out as a normal men tal conflict Since a new repression is thus avoided the opposition between the ego and the libido comes to an end unity is restored within the patient s mind When the libido has been detached from its temporary object in the person of the physician it cannot return to its earlier objects but is now at the disposal of the ego The forces opposing us in this struggle during the therapeutic treatment are on the one hand the ego s aversion against certain tend encies on the part of the libido which had ex pressed itself in repressin tendencies and on the other hand the tenacity or *adhesiveness* of the libido which does not readily detach itself from objects it has once invested

The therapeutic work thus falls into two phases in the first all the libido is forced away from the symptoms into the transference and there concentrated in the second the bat tle rages round this new object and the libido is made free from it. The change that is decisive for a successful outcome of this renewed con flict lies in the preclusion of repression so that the libido cannot again withdraw itself from the ego by a flight into the unconscious It is made possible by changes in the ego ensuin as a consequence of the analyst s sug estions. At the expense of the unconscious the e o becomes wider by the work of interpretation which brings the unconscious material into conscious ness through education it becomes reconciled to the libido and is made willing to grant it a certain degree of satisfaction and its horror of the claims of its libido is lessened by the new capacity it acquires to expend a certain amount of the libido in sublimation The more nearly the course of the treatment correspond with this ideal description the greater will be the success of the psycho analytic therapy Its barriers are found in the lack of mobility in the libido which resists bein released from its objects and in the rigidity of the patient s narcissism which will not allow more than a certain degree of object transference to de velop Perhaps the dynamics of the process of recovery will become still clearer if we describe it by saying that in attracting a part of it to our elves through transference we gather in the whole amount of the libido which has been withdrawn from the ego s control

It is as well here to make clear that the dis tributions of the libido which ensue during and by means of the analysis afford no direct in ference of the nature of its disposition during the previous illne s Given that a case can be successfully cured by establishing and then re solving a powerful father transference to the person of the physician it would not follow that the patient had previously suffered in this way from an unconscious attachment of the libido to his father The father transference is only the battlefield on which we conquer and take the libido pri oner the patient s libido has been drawn hither away from other positions The battlefield does not necessarily constitute one of the enemy s most important strongholds the defence of the enemy s capital city need not be conducted immediately before its gates.

man with whom he had established relation ship that had proved satisfying in more than one respect. Made suspicious by her daughter's passionate demands the mothe suddenly apprehended wat the girls dread signified She had become ill in rder to make he m th r a prisoner and rob her of th freed m necessary for her to maintain her relat ns with her love The mothers d cision was instantly taken She pu an end to the harmful treatment. The girl was sent t a home for nervous patients, and fo many years was there pointed out as an "unhappy victim of psycho-analysis for just as long I was pursued by damaging ru mours about the unf rtunat result f the treatment I maintained sil n e because I supposed myself bound by the rules of professional secrecy Years later I learned from a colleague who had visited the home and there seen the girl with agoraphobia that the intimacy between the m ther and th wealthy man was ... ures by taking int account these disturbing external factors! Friends of analysis have ad vised us to counte -balance a collection of failures by drawing up a tatistical enumeration of our u cesses I ha e not taken up this sug gestio either I brought f rward the argument that tatistics would be aluleless if the units collated were not alike and the cases which had been treated were in fact n t equ alent in man re pects Further the period of time that could be reviewed was too hort for one t be abl to judge of the permanence of the cures and of many cases it would be mposs ble to give any account Th y were pers ns who had kept both the r illness and their treat me t se ret and whose recovery in consequence had imila ly to be kept secret. Th is a gloomy outlook f r th fficacy of psycho-analysis as therapy en if w may explain the overwhelming majority f our fail

opponent A ery ev dent prejud ce gainst Wh on

when a patient wh had already go through fou cycles of depres n and mania came to me in an int rval after the melancholia and three weeks late again began to develop an attack of mani all the members of the family and also all the high medical authorities who were called in, were con inced that th fresh attack could be nothing but a consequence of the attempted analysi Against prej d ce one can d n thin as o can now see once m re in the prejudices that ea h group f the na tions t war has developed gainst th th The most sen bl thing to do is t wait and allow them t wear ff with the passage of time A day comes when th same people regard th same things quite a different light from what they did bef why they thought dif f rently bef re remains dark secret.

It is po bl that th prejudice against the analytic therapy has lready begun to relax. The contin al spread of analyti doctrine and the mbers f medical men taking up anal tic treatment in many countries seem to point in

out a threat to psycho analysts that by pub lishing a collection of the failures and harmful effects of analysis they will open the eyes of the injured public to the worthlessness of this method of treatment Apart from the malicious denunciatory character of such a measure how ever a collection of that kind would not even be valid evidence upon which a correct esti mate of the therapeutic results of analysis might be formed Analytic therapy as you know is still young it needed many years to elaborate the technique which could only be done in the course of the work under the influence of in creasing experience On account of the difficul ties of imparting instruction in the methods the beginner is thrown much more upon his own re ources for development of his capacity than any other kind of specialist and the re sults of his early years can never be taken as indicating the full possible achievements of analytic therapy

Many attempts at treatment made in the beginning of psycho analysis were failures be cause they were undertaken with cases alto gether unsuited to the procedure which nowa days we should exclude by followin certain indications These indications however could only be discovered by trying In the beginning we did not know that paranoia and dementia præcox when fully developed are not amena ble to analysis we were still justified in trying the method on all kinds of disorders Most of the failures of those early years however were not due to the fault of the physician or to the unsuitability in the choice of subject but to unpropitious external conditions I have spoken only of the inner resistances those on the part of the patient which are inevitable and can be overcome The external resistances which the patient s circumstances and surroundings set up against analysis have little theoretic interest but the greatest practical importance Psycho analytic treatment is comparable to a surgical operation and like that for its success it has the right to expect to be carried out under the most favourable conditions You know the pre liminary arrangements a surgeon is accustomed to make—a suitable room a good light expert assistance exclusion of the relatives and so on Now ask yourselves how many surgical operations would be successful if they had to be conducted in the presence of the patient s entire family poking their noses into the scene of the operation and shrieking aloud at every cut. In psycho analytic treatment, the inter vention of the relatives is a positive danger and moreover one which we do not know how to deal with We are armed against the inner resistances of the patient which we recogn..e as necessary but how can we protect our elves against these outer resistances? It is impos. ble to get round the relatives by any sort of expla nation nor can one induce them to hold aloof from the whole affair one can never take them into one s confidence becau e then we run the danger of losing the patient s trust in us for h —quite rightly of course—demands that the man he confides in should take his part. Any one who knows anything of the dissen ions commonly splitting up family life will not be astonished in his capacity of analyst to find that tho e nearest to the patient frequently show less interest in his recovery than in keeping him as he is Wh n

I ke much of putting his own interest before the patient s recovery After all it is not sur prising that the hu band does not favour a treatment in which as he correctly supposes his sins will all come to light nor do we wonder at this but then we cannot blame ourselves when our efforts remain fruitless and are pre maturely broken off because the husband s re sistance is added to that of the sick wife We had simply undertaken something which under the existing conditions it was impossible to carry out

Instead of describing many cases to you I will tell you of one only in which I had to suffer for the sake of professional conscientiou ness I took a youn girl—many years ago—for analytic treatment for a considerable time previously she had been unable to go out of doors on account of a dread nor could be stay at home alone After much hesitation the patient confessed that her thoughts had been a good deal occupied by some signs of affection that she had noticed by chance between her mother and a well to-do friend of the family Very tactlessly—or else very cleverly—she then gave the mother a hint of what had been dis cussed during the analysis she did this by altering her behaviour to her mother by insist ing that no one but her mother could protect her against the dread of being alone and by holding the door against her when she at tempted to leave the hou e The mother herself had formerly been very nervous but had been cured years before by a vis t to a hydropathic establishment—or putting it otherwise we may say she had there made the acquaintance of the

Beyond the Pleasure Principle[1]

I

In the psycho-analytical theory of the mind, we take it for granted that the course of mental processes is automatically regulated by *the pleasure-principle*: that is to say, we believe that any given process originates in an unpleasant state of tension and thereupon determines for itself such a path that its ultimate issue coincides with a relaxation of this tension, i.e. with avoidance of "pain"[2] or with production of pleasure. When we consider the psychic processes under observation in reference to such a sequence we are introducing into our work the *economic* point of view. In our opinion a presentation which seeks to estimate *not only* the *topographical* and *dynamic* but also the economic element is the most complete that we can at present imagine and deserves to be distinguished by the term *meta-psychological*.

We are not interested in examining how far in our assertion of the pleasure-principle we have approached to or adopted any given philosophical system historically established. Our approach to such speculative hypotheses is by way of our endeavour to describe and account for the facts falling within our daily sphere of observation. Priority and originality are not among the aims which psycho-analysis sets itself, and the impressions on which the statement of this principle is founded are of so unmistakable a kind that it is scarcely possible to overlook them. On the other hand we should gladly acknowledge our indebtedness to any philosophical or psychological theory that could tell us the meaning of these feelings of pleasure and "pain" which affect us so powerfully. Unfortunately no theory of any value is forthcoming. It is the obscurest and least penetrable region of psychic life and, while it is impossible for us to avoid touching on it, the most elastic hypothesis will be, to my mind, the best. We have decided to consider pleasure and "pain" in relation to the quantity of excitation present in the psychic life—and not confined in any way—along such lines that "pain" corresponds with an increase and pleasure with a decrease in this quantity. We do not thereby commit ourselves to a simple relationship between the strength of the feelings and the changes corresponding with them; least of all, judging from psycho-physiological experiences, to any view of a direct proportion existing between them; probably the amount of diminution or increase in a given time is the decisive factor for feeling.

We cannot, however, profess the like indifference when we find that an investigator of such penetration as G. Th. Fechner has advocated a conception of pleasure and "pain," which in essentials coincides with that forced upon us

schichte der Organismen, 1873 (Section XI, note p. 94) and reads as follows: "In so far as conscious impulses always bear a relation to pleasure or 'pain,' pleasure or 'pain' may be thought of in psycho-physical relationship to conditions of stability and instability, and upon this may be based the hypothesis I intend to develop elsewhere: viz., that every psycho-physical movement rising above the threshold of consciousness is charged with pleasure in proportion as it approximates—beyond a certain limit—to complete equilibrium, and with 'pain' in proportion as it departs from it beyond a certain limit; while between the two limits which may be described as the qualitative thresholds of 'pain' or pleasure there is a certain area of aesthetic indifference...."

The facts that have led us to believe in the supremacy of the pleasure-principle in psychic life also find expression in the hypothesis that there is an attempt on the part of the psychic apparatus to keep the quantity of excitation present as low as possible or at least constant. This is the same supposition only put into another form, for if the psychic apparatus operates in the direction of keeping down the quantity of excitation, all that tends to increase it must be felt to be contrary to function, that is to say painful. The pleasure-principle is deduced from the principle of constancy; in reality the principle of constancy was inferred

[1] Translated from the second German edition.—Ed.

[2] The word "pain" as in the phrase "pleasure-pain principle" has been translated as "pain"; pain without quotation marks signifies *Schmerz* in the original.—Tr.

that direction As a young man I was cau ht in just such a storm of indignation roused in the medical profession by the hypnotic sugges tion treatment which nowadays is held up in opposition to psycho analysis by the sober minded As a therapeutic instrument how ever hypnotism did not bear out the hopes placed in it we psycho analysts may claim to be its rightful heirs and should not forget how much encouragement and theoretic enlighten ment we owe to it The harmful effect [illegible] of [illegible]

[illegible] of when it is broken off suddenly You have heard an account of what we do with our patients and you can form your own judgment whether our efforts are likely to lead to lasting injury Misuse of analysis is pos sible in various ways the transference especial ly in the hands of an unscrupulous physician is a dangerous instrument But no medical remedy is proof against misuse if a knife will not cut neither will it serve a surgeon.

I have now reached the end It is more than a conventional formality when I say that I myself am heavily oppressed by the many de fects of the lectures I have delivered before you I regret most of all that I have so often promised to return again in another place to a subject that I had just touched upon shortly and that then the context in which I could keep my word did not offer itself I undertook to give you an account of a thing that is still un finished still developing and now my short summary itself has become an incomplete one In many places I laid everything ready for drawing a conclusion and then I did not draw it But I could not aim at making you experts in psycho analysis I only wished to put you in the way of some understanding of it and to arouse your interest in it

dim of impulse and these threats of danger a reaction in which the real activity of the psychic apparatus is manifested may be guided correctly by the pleasure-principle or by the reality-principle which modifies this. It seems thus unnecessary to recognize a still more far reaching limitation of the pleasure-principle and, nevertheless, it is precisely the investigation of the psychic reaction to external danger that may supply new material and new questions in regard to the problem here treated.

II

After severe shock of a mechanical nature, railway collision, or other accident in which danger to life is involved, a condition may arise which has long been recognized and to which the name *traumatic neurosis* is attached. The terrible war that is just over has been responsible for an immense number of such maladies and, at least, has put an end to the inclination to explain them on the basis of organic injury to the nervous system due to the operation of mechanical force. The clinical picture of traumatic neurosis approaches that of hysteria in its wealth of similar motor symptoms, but usually surpasses it in its strongly marked signs of subjective suffering—in this, resembling rather hypochondria or melancholia—and in the evidences of a far more comprehensive general weakening and disturbing of the mental functions. Neither the war neuroses nor the traumatic neuroses of peace are as yet fully understood. With the war neuroses something was contributed, but, also on the other hand, certain confusion introduced by the fact that the same type of malady could occasionally occur without the interposition of gross mechanical force. In the traumatic neuroses, there are two outstanding features which might serve as clues for further reflection: first, that the chief causal factor seemed to lie in the element of surprise in the fright, and second, that an injury or wound sustained at the same time generally tended to prevent the occurrence of the neurosis. *Fright, fear, apprehension* are incorrectly used as synonymous expressions in their relation to danger. They admit of a clear distinction. Apprehension (*Angst*) denotes a certain condition as of expectation of danger and preparation for it even though it be an unknown one. Fear (*Furcht*) requires a definite object of which one is afraid. Fright

(*Schreck*) is the name of the condition to which one is reduced if one encounters a danger without being prepared for it; it lays stress on the element of surprise. In my opinion, apprehension cannot produce a traumatic neurosis; in apprehension there is something which protects against fright and therefore against the fright-neurosis. We shall return later to this dictum.

The study of dreams may be regarded as the most trustworthy approach to the exploration of the deeper psychic processes. Now in the traumatic neuroses the dream life has this peculiarity: it continually takes the patient back to the situation of his disaster from which he awakens in renewed terror. This fact has caused less surprise than it merits. The obtrusion on the patient over and again, even in sleep, of the impression made by the traumatic experience is taken as being merely a proof of its strength. The patient has, so to speak, undergone a psychical fixation as to the trauma. Fixations of this kind on the experience which has brought about the malady have long been known to us in connection with hysteria. Breuer and I stated in 1893 that hysterics suffer for the most part from reminiscences. In the war neuroses observers such as Ferenczi and Simmel, have been able to explain a number of motor symptoms as fixation on the factor of the trauma.

But I am not aware that the patients suffer much from traumatic neuroses are much occupied in waking life with the recollection of what happened to them. They perhaps strive rather not to think of it. To regard as self-evident that the dream at night takes them back to the situation which has caused the trouble is to misunderstand the nature of dreams. It would be more in correspondence with that nature if the patient were presented (in sleep) with images from the time of his normal health or of his hoped for recovery. If we are not to go thoroughly astray as to the wish fulfilment tendency of the dream in consequence of these dreams of the shock neuroses, perhaps the expedient is left us of supposing that in this condition the dream function suffers dislocation along with the others and is diverted from its usual ends, or else we should have to think of the enigmatic masochistic tendencies of the ego.

I propose now to leave the obscure and gloomy theme of the traumatic neuroses and to study the way in which the psychic apparatus works in one of its earliest normal activities. I refer to the play of children.

The different theories of child-play have

Ferenczi, Abraham, Simmel and Ernest Jones, *Psycho-Analysis and the War Neuroses*, No. 1 of the International Psycho-Analytical Library.

from the facts that necessitated our assumption of the pleasure principle On more detailed dis cussion we shall find further that this tendency on the part of the psychic apparatus postulated by us may be classified as a special case of Fechner s principle of the *tendency towards sta bility* to which he has related the pleasure pain feelings

In that event however it must be affirmed that it is not strictly correct to speak of a supremacy of the pleasure principle over the course of psychic processes If such existed then the vast majority of our psychic proces es would necessarily be accompanied by pleasure or would conduce to it while the most ordinary experience emphatically contradicts any such conclusion One can only say that a strong tendency towards the pleasure principle exists in the psyche to which however certain other forces or conditions are opposed so that the ultimate issue cannot always be in accordance with the pleasure tendency Compare the com ment of Fechner in a similar connection Therewithal it is to be noted that the tendency towards the goal does not imply the attainment of it and that in general the goal is only ap proximately attainable If we now address ourselves to the question of what circumstances have the power to frustrate the successful carrying out of the pleasure principle we shall be treading on safer and better known ground and we can draw in abundant measure on our analytical experiences for the answer

The first case of such a check on the pleas ure principle is perfectly familiar to us in the regularity of its occurrence We know that the pleasure principle is adjusted to a primary mode of operation on the part of the psychic apparatus and that for the preservation of the organism amid the difficulties of the external world it is *ab initio* useless and indeed ex tremely dangerous Under the influence of the instinct of the ego for self preservation it is replaced by the *reality principle* which without giving up the intention of ultimately attaining pleasure yet demands and enforces the post ponement of satisfaction the renunciation of manifold possibilities of it and the temporary endurance of pain on the long and circuitous road to pleasure The pleasure principle how ever remains for a long time the method of operation of the sex impulses which are not so easily educable and it happens over and over again that whether acting through these im pulses or operating in the ego itself it prevails over the reality principle to the detriment of the whole organism

It is at the same time indubitable that the replacement of the pleasure principle by the reality principle can account only for a mall part and that not the most intense of painful experiences Another and no less regular source of pain proceeds from the conflicts and dis sociations in the psychic apparatus during the development of the ego towards a more highly co ordinated organization Nearly all the energy with which the apparatus is charged comes from the inborn instincts but not all of these are allowed to develop to the same stage On the way it over and again happens that partic ular instincts or portions of them prove ir reconcilable in their aims or demand with others which can be welded into the compre hensive unity of the ego They are thereupon split off from this unity by the proce s of repression retained on lower stages of psychic development and for the time being cut off from all possibility of gratification If they then succeed as so easily happens with the repressed sex impulses in fighting their way throu h—alon circuitous routes—to a direct or a substitutive gratification this success which might otherwise have brought pleasure is experienced by the ego as pain In conse quence of the old conflict which ended in re pression the pleasure principle has been vio lated anew just at the moment when certain impulses were at work on the achievement of fresh pleasure in pursuance of the principle The details of the process by which repression changes a possibility of pleasure into a ource of pain are not yet fully understood or are not yet capable of clear presentation but it is certain that all neurotic pain is of this kind is pleasure which cannot be experienced as such

The two sources of pain here indicated still do not nearly cover the majority of our painful experiences but as to the rest one may say with a fair show of reason that their pres ence does not impugn the supremacy of the pleasure principle Most of the pain we ex per ence is of a perceptual order perception either of the urge of unsatisfied instincts or of something in the external world which may be painful in itself or may arouse painful an ticipations in the psychic apparatus and is rec ognized by it as *danger* The reaction to these

After severe shock [illegible] a mechanical nature [illegible] collisions, or other accidents in which danger to life is involved, a condition may arise which has long been recognized and to which the name *traumatic neurosis* is attached. The terrible war that is just over has been responsible for an immense number of such maladies and, at least, has put an end to the [illegible] to explain them on the basis of organic injury [illegible] the nervous system due to the operation of mechanical force. The clinical picture [illegible] traumatic neurosis approaches that of hysteria in its wealth of similar motor symptoms, but usually surpasses it in its strongly marked signs [illegible] subjective suffering—in this, resembling rather hypochondria or melancholia—and in the evidences of [illegible] far more comprehensive general weakening and [illegible] of the mental functions. Neither the war neuroses nor the traumatic neuroses [illegible] peace are as yet fully understood. With the war neuroses something was contributed, but also on the other hand, a certain [illegible] introduced, by the fact that the same type of malady could occasionally occur without the intervention of gross mechanical force. In the traumatic neuroses, there are two outstanding features which might serve as clues for further reflection: first [illegible] the chief causal factor seemed to lie in the element [illegible] surprise in the fright, and second, that an injury or wound sustained [illegible] the same time generally tended to prevent the occurrence [illegible] the neurosis. *Fright* [illegible] are incorrectly used as synonymous expressions [illegible] their relation to danger they admit [illegible] quite clear distinction. Apprehension (*Angst*) denotes a certain condition as [illegible] expectation [illegible] danger and preparation for it even though it be an unknown one [illegible] fear (*Furcht*) requires a definite object [illegible] which one is afraid. Fright (*Schreck*) is the name of the condition to which one is reduced if one encounters a danger without being prepared for it [illegible] lays stress on the element [illegible] surprise. In my opinion, apprehension cannot produce a traumatic neurosis [illegible] apprehension there is something which protects against fright and therefore against the fright neurosis. We shall return later [illegible] this dictum.

The study of dreams may be regarded as the most trustworthy approach to the exploration of the deeper psychic processes. Now in the traumatic neuroses the dream life has this peculiarity [illegible] continually takes the patient back to the situation [illegible] his disaster, from which he awakens in renewed terror. This fact has caused less surprise than it merits. The obtrusion on the patient ever and again, even in sleep, of the impression made by the traumatic experience is taken as being merely a proof of [illegible] strength. The patient has, so to speak, undergone [illegible] psychical fixation as to the trauma. Fixation of this kind on the experience which has brought about the malady have long been known to us in connection with hysteria. Breuer and I stated in [illegible] that hysterics suffer for the most part from reminiscences. In the war neuroses observers such as Ferenczi and Simmel, have been able [illegible] explain a number of motor symptoms as fixation on the [illegible] factor of the trauma.

But I am not aware that the patients suffering from traumatic neuroses are much occupied in waking life with the recollection of what happened to them. They perhaps strive rather not [illegible] think of it. To regard [illegible] as self-evident that the dream [illegible] takes them back [illegible] the situation which has caused the trouble is [illegible] misunderstand the nature [illegible] dreams. I would be more in correspondence with that nature if the patient were presented (in sleep) with [illegible] from the time of his normal health [illegible] of his hoped for recovery. If we are not [illegible] go thoroughly astray as to the wish-fulfilment tendency [illegible] the dream in consequence of these dreams [illegible] the shock neuroses, perhaps the expedient is left us of supposing that in this condition the dream function suffers dislocation along with the others and is diverted from its usual end, or else we should have to think [illegible] the enigmatic masochistic tendencies of the ego.

I propose now to leave the obscure and gloomy theme of the traumatic neuroses and to study the way in which the psychic apparatus works in one [illegible] its earliest normal activities. I refer [illegible] the play [illegible] children.

The different theories [illegible] child-play have

Ferenczi, Abraham, Simmel and Ernest Jones, *Psycho-Analysis and the War Neuroses*, No. [illegible] of the International Psycho-Analytical Library [illegible]

recently been collated by S Pfeifer in *Imago* and their analytical value estimated I may here refer the reader to this work These theories endeavour to conjecture the motives of children s play thou h without placing any special stress on the *economic* point of view i e consideration of the attainment of pleasure Without the intention of m[illegible] a com p[illegible] availed m[illegible] of elu ci[illegible] game invented by himself of a boy eighteen months old It was more than a casual observation for I lived for some weeks under the same roof as the child and his parents and it was a considerable time before the meaning of his puzzling and continually repeated performance became clear to me

The child was in no respect forward in his intellectual development at eighteen months he spoke only a few intelligible words making besides sundry significant sounds which were understood by those about him But he made himself understood by his parents and the maid servant and had a good reputation for behaving properly He did not disturb his parents at night he scrupulously obeyed orders about not touching various objects and not going into certain rooms and above all he never cried when his mother went out and left him for hours together although the tie to his mother was a very close one she had not only nourished him herself but had cared for him and brought him up without any outside help Occasionally however this well behaved child evinced the troublesome habit of flinging into the corner of the room or under the bed all the little things he could lay his hands on so that to gather up his toys was often no light task He accompanied this by an expression of interest and gratification emitting a loud long drawn out o o o oh which in the judgment of the mother (one that coincided with my own) was not an interjection but meant go away *(fort)* I saw at last that this was a game and that the child used all his toys only to play being gone *(fortsein)* with them One day I made an observation that confirmed my view The child had a wooden reel with a piece of string wound round it It never occurred to him for example to drag this after him on the floor and so play horse and cart with it but he kept throwing it with considerable skill held by the string over the side of his little draped cot so that the reel disappeared into it then said his si nificant o o o oh and drew the reel by the string out of the cot again greeting its reappearance with a joyful *Da* (there) This was therefore the complete game di appearance and return the first act bein the only one generally observed by the onlookers and the one untiringly repeated by the child as a game for its own sake although the greater pleasure unquestionably attached to the second act

The meaning of the game was then not far to seek It was connected with the child s remarkable cultural achievement—the foregoing of the satisfaction of an instinct—as the re ult of which he could let his mother go away without making any fuss He made it right with himself so to speak by dramatizing the same disappearance and return with the objects he had at hand It is of course of no importance for the affective value of this game whether the child invented it himself or adopted it from a suggestion from outside Our interest will a tach itself to another point The departure of the mother cannot possibly have been pleasant for the child nor merely a matter of indifference How then does it accord with the pleasure principle that he repeats this painful experience as a game? The answer will perhaps be forthcoming that the departure must be played as the necessary prelude to the joyful return and that in this latter lay the true purpose of the game As a ainst this however there is the observation that the first act the going away was played by itself as a game and far more frequently than the whole drama with its joyful conclusion

The analysis of a single case of this kind yields no sure conclusion on impartial consideration one gains the impression that it is from another motive that the child has turned the experience into a game He was in the first place passive was overtaken by the experience but now brings himself in as playing an active part by repeating the experience as a game in spite of its unpleasing nature This effort might be ascribed to the impulse to obtain the mastery of a situation (the *power* instinct) which remains independent of any question of whether

*Th t rp etat w f lly st bl hed by a f th b rv t O d y wh th m th b d be t f m b rs sh w g eet d b ret rn by th f rm t B by *o-o-o-o* which t first re m d t ll g bl It oo p d th t d g h l g l ly h h h d f d m thod f b g g b t b wn d ppe H h d d sc red h flect th l g m wh ch ly hed t th g d d h d th er ched dow i f t f lt, s th t th flect was f f

the recollection was a pleasant one or not. But another interpretation may be attempted The flinging away of the object so that it is gone might be the gratification of an impulse of revenge suppressed in real life but directed against the mother for going away and would then have the defiant meaning Yes you can go I don t want you, I am sendin you away myself The same child a year later than my observation used t thr w on th floor a toy which displeased him and to say Go to the war He had been told that his absent f ther was at the war and he did not miss him at all giving the clearest indicat ons that he did not wish t be disturbed in the ole posses on of his mothe It is known f other children lso that they can give vent to imilar hostile feel ings by throwing objects way in place of people Thus one is l ft in d ubt whether the compulsion to work over in psychi life what has made deep impress on to make oneself fully master of t can express itself primarily and independently of the pleasure principl In the case discussed here however the child might have repeated disagreeable impres ion in play only because with the repet tion was bound up pleasure gain f a different kind but more direct.

Nor does the further pursuit f the question of play resolve our hesit t ons between two concepts n. W see that children repeat in their play everything that ha mad a great impre on o them in actual lif that they thereby b-react the t ength f the impressi n and so to speak mak themselves ma ters of the situati n. But on the her hand t is lear en gh that all their play is influenced by th dominant wish of th tim f life viz. to be grown-up and t be ble t do what grown up people d It is also observable that the un pleasing character f the xperience does not always prevent its being tilized as a gam If doctor examines a child thro t perf rms small operation on him the larming ex perience will quit ertainly be mad the subject f th ext gam but in this th pleasure gain from an ther sour is not t be over looked. In passing from the passivity f ex perien e to the ct ty f play the hild applies to his playf llow th unpleasant occurrence that befell himself and so avenges himself on the person of this proxy

From this d cu s on it is at all events evident that it is unnecessary to assume a particular imitation impulse as the moti e of play We ma add the reminder that the dramatic a d im tative art of adults wh ch differs from the behaviour of children in being directed towards the spectator does not however spare the lat ter the most painful impres ons e.g in trag edy and yet can be felt by him as h ghly enjoyable This con nces us that even u der the domination of the pleasure principle there are wa s and means enough of making what is in itself disagreeable the object of mem ry and of psychic preoccupation A theory of aes het ics with an eco omic point of view should deal with these cases and situations end g in final pleasure gain for our purposes they are of no h lp sinc they presuppose the exi tence and supremacy of the pleasure principle a d bear n witness to the operation of tendencies bey nd the pl asure principle that s to say tendencies which might be of earlier origin and independent of this.

III

FIVE-AND-TWENTY years of inten e wo k have brought about complete change in the more immediate aim of psycho-analytic technique At first the endea ours of the a al tic ph si cian were confined to divining the uncon cious f which his patient was unaware effectin a synthesis of ts arious components and com municating it a the right time Psycho-anal sis was bove ll an art f interpretat n Since the therapeut c ta k was n t thereby acc m plished, the next aim wa to compel th patient to c nfirm the reconstruction through his own memory In this endea our th chief empha is was on the re istances of th patient the rt now lay in un eiling these as soon as po ble in call g th patient s ttenti n to them and by human influence—here came in suggestion cting as *tr nsferen e*—teaching him to ban don the resistances

It then becam increasingly clear however that the aim m ew the bringing into con ciousness of the unconscious was not fully ttainable by this method either The patient cann t recall ll f what lies repressed perhaps n t even the essential part of it and so gains no con ction that th co clus n presented to him is correct. H is bliged rather to *r p at* as a current experien what repressed, in stead of as th physician would prefer to see

When the child was five and three-quarter years old h mothe died Now hen he was reall gone (o-o-o the boy owed no grief f her A second child had, is true been born in the meantime and had roused his fiercest jealousy

See A Childhood Memory from *Dichtung und Wahrheit* in *Collected P pers* IV

him do *recollecting* it as a fragment of the past This reproduction appearing with un welcome fidelity always contains a fragment of the infantile sex life therefore of the Oedipus complex and its off shoots and is played regu larly in the sphere of transference i e the relation hip to the physician When this point in the treatment is reached it may be said that the earlier neurosis is now replaced by a fresh one viz the transference neurosis The physi cian makes it his concern to limit the scope of this transference neurosis as much as he can to force into memory as much as possible and to leave as little as possible to repetition The relation established between memory and re production is different for every case As a rule the physician cannot spare the patient this phase of the cure he must let him live throu h a certain fragment of his forgotten life and has to see to it that some measure of ascendency remains in the light of which the apparent reality is always recognized as a re flection of a forgotten past If this is success fully accomplished then conviction on the part of the patient is attained and with it the ther apeutic result that depends on it

In order to render more comprehen ible this *repetition compulsion* which appears in the psycho analytic treatment of neurotics we must above all get entirely rid of the erroneous idea that in this struggle with resistances we are concerned with any resistance on the part of the unconscious The unconscious i e the *repressed* material offers no resistance what ever to the curative efforts indeed it has no other aim than to force its way through the pressure weighin on it either to consciousness or to discharge by means of some real action The resistance in the treatment proceeds from the ame higher levels and systems in the psy chic life that in their time brought about the repression But since the motives of the resist ance and indeed the resistances themselves are found in the process of the treatment to be unconscious we are well advi ed to amend an inadequacy in our mode of expression We es cape ambiguity if we contrast not the conscious and the unconscious but the coherent ego and the repressed Much in the ego is certainly unconscious itself just what may be called the kernel of the ego only a part of it comes under the category of *preconsc ous* After thus replac ing a purely descriptive method of expression by a systematic or dynamic one we may say that the resistance on the part of the analysed per on proceed from his ego and then we at once see that the *repetition compulsion* must be ascribed to the repressed element in the un conscious It probably could not find expression till the work of the treatment coming to meet it had loosened the repression

There is no doubt that the resistance of th conscious and preconscious e o subserves the pleasure principle it is trying to avoid the pain that would be aroused by the release of the repressed material and our efforts are di rected to effecting an entry for such painful feeling by an appeal to the reality principle. In what relation to the pleasure principle then does the repetition compulsion stand that which expres es the force of what is repressed? It is plain that most of what is revived by the repetition compulsion cannot but brin discom fort to the ego for it promotes the bringing to light of the activities of repressed impulses but that is a discomfort we have already taken into account and without subversion of th pleasure principle since it is pain in re pect of one system and at the same time satisfaction for the other The new and remarkable fact however that we have now to describe is that the repetition compul ion also revives experi ences of the past that contain no potentiality of pleasure and which could at no time have been satisfactions even of impulses since repressed

The efflorescense of infantile sex life was by reason of the irreconcilability of its wishes with reality and the inadequacy of the childhood stage of development reached destined to pass away It perished in mo t painful circumstances and with feelings of a deeply distressing nature. Loss and failure in the sphere of the affections left behind on the ego feelin marks of injury comparable to a narcissistic scar which accord ing to my experience and the em h

[illegible] sex-quest to which the physical development of the child set limits could be brought to no satisfyin conclusion hence the plaint in later life I can t do any thin I am never successful The bonds of tenderness linkin the child more especially to the parent of the opposite sex succumbed to disappointment to the vain expectation of sat

pleasurable satisfaction of impulse eem there to be inextricably intertwined The transference phenomena obviously subserve the purpo e of the resistance made by the ego persisting in its repression the repetition compulsion is as it were called to the aid of the ego which is resolved to hold fast to the pleasure principle In what one might call the destiny compulsion much appears capable of rational explanation so that no need is felt to establish a new and mysterious impulse The least suspicious case is perhaps that of the shock dream but on closer examination it must be admitted that in the other examples too the state of affairs is not completely explained by the operation of the motives known to us There remains enou h over to justify the assumption of a repetition compulsion and this seems to us more primitive more elementary more instinctive than the pleasure principle which is displaced by it But if there is such a repetition compul ion in psychic life we should naturally like to know with what function it corresponds under what conditions it may appear and in what relation it stands to the pleasure principle to which we have heretofore ascribed the domination over the course of the processes of excitation in the psychic life

IV

WHAT follows now is speculation speculation often far fetched which each will according to his particular attitude acknowledge or ne lect Or one may call it the exploitation of an idea out of curiosity to see whither it will lead

Psycho-analytic speculation starts from the impression gained on investigating unconscious processes that consciousness cannot be the most general characteristic of psychic processes but merely a special function of them Metapsychologically expressed it asserts that consciousness is the functioning of a particular system which may be called *Bw* Since consciousness essentially yields perceptions of excitations comin from without and feeling *(Empfindungen)* of pleasure and pain which can only be derived from within the psychic apparatus we may allot the system *W Bw* (= perceptual consciousness) a position in space It must lie on the boundary between outer and inner must face towards the outer world and must envelop the other psychic systems We then note that in this assumption we have ventured nothing new but are in agreement with the localizing tendencies of cerebral anatomy which places the *seat* of consciousness in the cortical layer the outermost enveloping layer of the central organ Cerebral anatomy does not need to wonder why—anatomically speaking—consciousness should be accommodated on the surface of the brain instead of being safely lod ed somewhere in the deepest recesses of it Perhaps we may carry matters a little further than this in our deduction of such a position for our system *W Bw*

Consciousness is not the only peculiar feature that we ascribe to the processes in this system Our impre sions gained by psycho analytic experience lead us to the supposition that all excitation processes in the other systems leave in them permanent traces formin the foundations of memory records which have nothing to do with the question of becoming conscious They are often strongest and most enduring when the process that left them behind never reached consciou ness at all But we find it difficult to believe that such lasting traces of excitation are formed also in the system *W Bw* itself If they remained permanently in consciousness they would very soon limit the fitness of the system for registration of new excitations on the other hand if they became unconscious we should be confronted with the task of explaining the existence of unconscious processes in a system whose functioning is otherwise accompanied by the phenomenon of consciousness We should so to speak have gained nothing and altered nothing by our supposition which relegates to a special system the process of becoming conscious Though this may not be an absolutely bindin consideration it may at any rate lead us to conjecture that becoming conscious and leaving behind a memory trace are processes incompatible with each other in the same system We should thus be able to say in the system *Bw* the process of excitation becomes conscious but it leaves behind no lasting trace all the traces of it on which memory rel es would come about in the next systems inward from the propagation of the excitation on to them It is on these lines that the scheme is sketched which I inserted into the speculative section of my *Interpretation of Dreams* in 1900 If one reflects how little we know from other sources about the origin of consciousness the pronouncement that *consc ousness arises in*

body but portions of it have been left on the surface immediately beneath the common protective barrier These portions form the sense organs which essentially comprise arran e ments for the reception of specific stimuli but also possess pecial arrangements adapted for a fresh protection against an overwhelming amount of stimulus and for warding off unsuitable kinds of stimuli It is characteristic of them that they assimilate only very small quantities of the outer stimulus and take in only samples of the outer world one might compare them to antennae which touch at the outer world and then constantly withdraw from it again

At this point I shall permit myself to touch cursorily upon a theme which would deserve the most thorough treatment The Kantian proposition that time and space are necessary modes of thought may be submitted to discussion today in the light of certain knowledge reached throu h psycho analysis We have found by experience that uncon cious mental processes are in themselves *timeless* That is to say to begin with they are not arranged chronologically time alters nothing in them nor can the idea of time be applied to them These are ne ative characteristics which can be made plain only by instituting a comparison with conscious psychic processes Our abstract conception of time seems rather to be derived wholly from the mode of functioning of the system W *Bw* and to correspond with a self perception of it In this mode of functionin of the system another form of protection against stimulation probably comes into play I know that these statements sound very obscure but I must confine myself to these few hints

So far we have got to the point that the living vesicle is equipped with a protection a ainst stimuli from the outer world Before that we had decided that the cortical layer next to it must be differentiated as the or an for reception of external stimuli But this sensitive layer (what is later the system *Bw*) also receives excitations from within the position of the system between outer and inner and the difference in the conditions under which this receptivity operates on the two s des become decidin factors for the functioning of the system and of the whole psychic apparatus Towards the outer world there is a barrier against stimuli and the mass of excitations coming up against it will take effect only on a reduced scale towards what is within no protection against stimuli is possible the excitations of the deeper layers pursue their way direct and in undiminished mass into the system while certain characteristics of their course produce the series of pleasure pain feelin s Naturally the excitations coming from within will in conformity with their intensity and other qualitative characteristics (or possibly their amplitude) be more proportionate to the mode of operation of the system than the stimuli streamin in from the outer world Two thin s are however decisively determined by the e condition fire the pre...
pleasu...
for pr... the mechani m and secondly a shaping of behaviour towards uch inner excitations as bring with them an overplus of pain There will be a tendency to treat them as thou h they were acting not from within but from without in order for it to be possible to apply against them the defensive measures of the barrier a ainst stimuli (*Reischut*) This is the origin of projection for which so important a part is reserved in the production of pathological states

I have the impression that by these last considerations we have approached nearer to a comprehension of the supremacy of the pleasure principle but we have not attained to an explanation of those cases which are oppo ed to it Let us therefore go a step further Such external excitations as are strong enough to break through the barrier against stimuli we call *traumatic* In my opinion the concept of trauma involves such a relationship to an otherwise efficacious barrier An occurrence uch as an external trauma will undoubtedly provoke a very extensive disturbance in the workings of the energy of the organism and will et in motion every kind of protective mea ure But the pleasure principle is to begin with put out of action here The flooding of the psychic apparatus with large masses of stimuli can no lon er be prevented on the contrary another task presents it elf—to bring the stimulus under control to *b nd* in the psyche the stimulus mass that has broken its way in so as to bring about a discharge of it.

Probably the specific discomfort of bodily pain is the result of some local breakin throu h of the barrier against stimuli From this point in the periphery there stream to the central psychic apparatus continual excitations such as would otherwise come only from within. What are we to expect as the reaction of the

S th p p *Inst ct d th r) scu tud* p 4 3 abo e

psychic life to th n a on? From ll s des the *charging energy* is cal ed in order to cre al round the breach correspondingly high *charges* of energy An immense *counter charge* is set up in fa our of which all the other psychic s tems are impoverished so that a wide-spread paral sis or diminutio of her psychi acti ty follows. We endeavour to learn from examples s ch as these to base our meta psychological co j ctures o su h prototypes Th from this beha our we draw the con clusion that even a highly charged system is a e to recei e new energy streaming in to convert it into a *quiescent charge* thus t *bind* it psychically The more in ens is the intrinsic quiescent charge th great s s binding force and, co versely the l wer the charge of the system the less capable s t of receiving the energy tha stream in, and o the m re ve ent re the consequences when the barri r against stimul is broken through. It is not a valid object t thi view that th intensify g f the harges round the pla e f rruption could be much m re imply explained a the direct ction of the o c ming mass of e c a t . If that w re so th p ch c apparatus ould m rely und r o an increase of ts en rgy charges and th paral zi g character f pai with the impo eri hm t of all the ther systems, would remain wi h t explanatio Nor d the very o t discharge ff cts of pain m allicate our xpla on f they happen in a re ex mann tha is t ay they foll w wi o t the in rpo t of the ps ch c p-paratus Th definit nat e f all the dis cus ons that we t rm *m t psy h og cal* na turally m f m th fact that we kn w n thing abo t t natu of the excitation proc ess in th elements f th ps hic syst m and do not feel j fied in makin any assumption bou Thus are all th tim operating with lar X wh h we carry o e into every ew f rmula. That thi process is accomplished with energi h h diffe quantit t el is an ea ly dm ib po tu t that t h o has more than o quality (e.g in the direct f amp de) m y be egarded a probabl the new on d ration we ha e brought in is Breue propos t that w ha t d with tw w vs in which y t m ma be filled with energy so that d ct o has t be made be tween *h g g f the psy hi sy t m* (o ts elements) that is f fl wi g and tri ing to be discharged and ne that is qui ent. P haps we may dmit the conjecture that th bindi g of the energy streaming into the psychic p-

I think o e ly regard the ord n ry traumatic neuros s as the result of a exten i e rupture of th barrier a a n t s mul In this wa the old nai e doc tri e of *shock* would come into its own again apparently in oppos tion to a later and psycho logically more pretentious ew which ascribes aetiological n ficance not to the effect of the mechanical f rce but to the fri ht and th menace to life But th se oppo in vews are ot irreco cilable and the psycho-analytic con ception of the traumatic neurosis is far from bein identical with the crudest form of the *shock* theory While th latter takes the essen tial nat re of the hock as res din in the di rect i jury to the mol cular structure or even to the hi t lo ical structure of the n rvous elements we seek to understand the ff ct of the shock b c ns dering th breaking through of the barrier with wh ch the psychic organ is provided again t stimul a d from th tasks with which this is thereby faced Fri ht r tains its meaning f r us too What conditio s it is the failure of the m chanism of apprehens n to make the proper preparation including the over-charging of the systems first recei ing the stim lus I c nsequence of this lowe degree of charging these systems re hardly i a posi tion t bind the o comin masses of excitation, and the co sequences of the breaki g through of the p tecti e barrier appear all the more ea ly We thus fi d that the apprehensive preparation, togethe with the o e -chargi g of the receptive systems represents the la t l e f d fen e agai t timuli For a great number of traumata the diff ence between the unpre pared syst ms a d those prepared by o er charging may turn the cale a to the o tcome with trauma beyond a cert n strength such a difference m y no longer be of an impor tance. When the dreams f pat nts suff ring from tra m t c euroses so regularly take them ba k to th situation of the disaste they do not thereby t is tru serve the purpose of wi h f lfilm t, the hallucinat ry conj ring up f whi h has unde th d minat on f the pleasu e-principle become the funct n of dreams But w m y a um that they th reby subs rve anoth purpose which must be ful filled bef re th pleasure principl can begi its wa Th se dreams re ttempts at restoring c t l of th stimu by developing apprehen sion th p et rmis f which ca sed the traumatic eurosis. They thus aff rd us an in

sight into a function of the psychic apparatus which without contradicting the pleasure principle is nevertheless independent of it and appears to be of earlier origin than the aim of attaining pleasure and avoiding pain

This is therefore the moment to concede for the first time an exception to the principle that the dream is a wish fulfilment Anxiety dreams are no such exception as I have repeatedly and in detail shown nor are the *punishment dreams* for they merely put in the place of the interdicted wish fulfilment the punishment appropriate to it and are thus the wish fulfilment of the sense of guilt reacting on the contemned impulse But the dreams mentioned above of patients suffering from traumatic neuroses do not permit of classification under the category of wish fulfilment nor do the dreams occurring during psycho analysis that bring back the recollection of the psychic traumata of childhood They obey rather the repetition compulsion which in analysis it is true is supported by the (not unconscious) wish to conjure up again what has been forgotten and repressed Thus the function of the dream viz to do away with the motives leading to interruption of sleep by presenting wish fulfilments of the disturbing excitations would not be its original one the dream could secure control of this function only after the whole psychic life had accepted the domination of the pleasure principle If there is a *beyond the pleasure principle* it is logical to admit a prehistoric past also for the wish fulfilling tendency of the dream though to do so is no contradiction of its later function Now when this tendency is once broken through there arises the further question are such dreams which in the interests of the psychical binding of traumatic impressions follow the repetition-compulsion not possible apart from analysis? The answer is certainly in the affirmative

With regard to the war neuroses so far as the term has any significance apart from a reference to the occasion of the appearance of the illness I have explained elsewhere that they might very well be traumatic neuroses which have arisen the more easily on account of an ego conflict The fact mentioned on page 641 viz that a severe injury inflicted at the same time by the trauma lessens the chance of a neurosis arising is no longer difficult to understand if two circumstances emphasised by psycho analytic research are borne in mind First that mechanical concussion must be recognized as one of the sources of sexual excitation and secondly that a painful and fever h ill ness exerts for the time it lasts a powerful influence on the distribution of the libido Thus the mechanical force of the trauma would set free the quota of sexual excitation which in consequence of the lacking preparation by apprehension has a traumatic effect but on the other hand the contemporaneous bodily injury would bind the surplus excitation by the putting in of a claim to a narcissi tic over charging of the injured part It is also known though the idea has not been sufficiently made u e of in the Libido theory that disturbances in the distribution of the libido o severe as those of melancholia may be re moved for a time by an intercurrent organic disease in fact even the condition of a fully developed *dementia praecox* is capable of a transitory improvement in these circumstances.

V

THE fact that the sensitive cortical layer has no protective barrier against excitations emanating from within will have one inevitable consequence viz that these transmissions of stimuli acquire increased economic significance and frequently give rise to economic disturbances comparable to the traumatic neuroses The most prolific sources of such inner excitations are the so called *instincts* of the organism the representatives of all forces arising within the body and transmitted to the psychic apparatus—the most important and most obscure element in psychological research

Perhaps we shall not find it too rash an assumption that the excitations proceeding from the instincts do not conform to the type of the *bound* but of the free moving nerve proces es that are striving for discharge The most trustworthy knowledge we have of these processes comes from the study of dreams There we found that the processes in the unconscious systems are fundamentally different from tho e in the (pre)conscious that in the unconscious cha ges may easily be completely transferred di placed or condensed while if this happened with preconscious material only defective results would be obtained This is the reason for the well known peculiarities of the manife t dream after the preconscious re idues of the

dry before have undergone elaboration ccord g to the laws of the unconscious. I termed this kind of process in th unconscious the psychic *primary pr c ss* in contradistinction to the secondary process valid in our normal waking life. Since the excitations of instincts all affect the unconscious systems t is scarcely an innovation t say that they follow the lines of the primary process and li tle more so to identif the psychic primary process with the freel m bile —

makes the primary process The failure t fect this binding would evoke a disturbance analogous t the traumatic neuroses it is only after the binding had been successful accomplished that the p easure-principle (and its modification th reality principle) would have an opportunity to assert ts sway without hindrance Till then, the other task f the psychic apparatus would tak precedence, viz., to obtain control or t bind the excitation, not in opposition to the pleasure-princip but independently of it and in part without regard t t.

The expressions of a repetition-compulsion which we have described both in the early activities f infantile psychi life and in th experiences of psycho-analytic treatment, show in a high degree an instinctive character and, where they com into contrast with the pleasure-principle a demoni character In the play of children, we seem to arrive at the co clusion that the child repeats even the unpleasant experiences because throu h his own acti ty he gains a far m re th ro h mastery of the strong impression than was possible by mere passive experience E ery fresh repet t on eems to strengthen this mastery fo which the child strives even with pleasurabl experiences the child cann t do enough in th way of repetition and will inex rably ins st on th dentity of the impression. This haracteri tic is dest ed later to disappear A witticism heard fo the second time will almost fail of eff ct th trical performance will neve make the same impression on the se ond tim that t did on the first occasion indeed, it is hard to persuad th d lt to read again ll soo book h has j ted. Novelty is al ays the ecessary co dit on f enjoyment. The hild h wev ever gets tired f demanding from grown up the repet t n of a game he has played with him before o has shown him till at last the grown up refuses, utterl worn out imilarly f he has been told a pretty story he wants alwa s to hear the same story instead of a new one insists i exorably on exact repetition and corrects each deviation wh ch the narrator lets slip by m s take which, perhaps he even thou h to gain new merit by insert ng Here there is no contradiction of the pleasure-principle it is evident that the repeti on the red scovery of the identity is itself a source of p easure In the case of a pa ent in analys s on the other ha d, it is plain that the compul on to repeat in the transference the occurrences of his infantile life disregards *in every way* the pleasure principle The pa ent behaves i this respect completely like a child and thus makes it clear to us that the repressed mem ry traces of his primitive experience are n t present i a *b* and form re indeed in a sense not capable of the secondary process To this fact of their not being bound the owe the r power to weave a wish phantasy that will be represented i a dream by adhering to the residues from waking experien es. We frequently encounter the same repetition-c mpuls on as a therapeutic obstacle, when at the end of the treatment we wish to bring bout compl te detachment from the ph s cian and it may be supposed that the vague dread with which those who are unf miliar with t view analysis as though they feared to wake what they think is better left to leep is at root a fear of the ppearance of this demonic compul on.

expression of the conservative nature of living beings On the other hand we soon think of those examples in animal life which appear to confirm the idea of instinct having been historically conditioned When certain fish undertake arduous journeys at spawning time in order to deposit the spawn in certain definite waters far removed from their usual habitats according to the interpretation of many biologists they are only seeking the earlier homes of their kind which in course of time they have exchanged for others The same is said to be true of the migratory flights of birds of passage but the search for further examples becomes superfluous when we remember that in the phenomena of heredity and in the facts of embryology we have the most imposing proofs of the organic compulsion to repetition We see that the germ cell of a living animal is obliged to repeat in its development—although in a fleeting and curtailed fashion—the structures of all the forms from which the animal is descended instead of hastening along the shortest path to its own final shape A mechanical explanation of this except in some trifling particulars is impossible and the historical explanation cannot be disregarded In the same way we find extending far upwards in the animal kingdom a power of reproduction whereby a lost organ is replaced by the growth of a new one exactly like it

The obvious objection that it may well be that besides the conservative instincts compelling repetition there are others which press towards new formation and progress should certainly not be left unnoticed it will be considered at a later stage of our discussion But we may first be tempted to follow to its final consequences the hypothesis that all instincts have as their aim the reinstatement of an earlier condition If what results gives an appearance of *profundity* or bears a resemblance to mysticism still we know ourselves to be clear of the reproach of having striven after anything of the sort We are in search of sober results of investigation or of reflections based upon it and the only character we wish for in these results is that of certainty

If then all organic instincts are conservative historically acquired and are directed towards regression towards reinstatement of something earlier we are obliged to place all the results of organic development to the credit of external disturbing and distracting influences The rudimentary creature would from its very beginning not have wanted to change would if circumstances had remained the same have always merely repeated the same course of existence But in the last resort it must have been the evolution of our earth and its relation to the sun that has left its imprint on the development of organisms The conservative organic instincts have absorbed every one of these enforced alterations in the course of life and have stored them for repetition they thus present the delusive appearance of forces striving after change and progress while they are merely endeavouring to reach an old goal by ways both old and new This final goal of all organic striving can be stated too It would be counter to the conservative nature of instinct if the goal of life were a state never hitherto reached. It must rather be an ancient starting point, which the living being left long ago and to which it harks back again by all the circuitous paths of development If we may assume as an experience admitting of no exception that everything living dies from causes within itself and returns to the inorganic we can only say *The goal of all life is death* and casting back *The inanimate was there before the animate*

At one time or another by some operation of force which still completely baffles conjecture, the properties of life were awakened in lifeless matter Perhaps the process was a prototype resembling that other one which later in a certain stratum of living matter gave rise to consciousness The tension then aroused in the previously inanimate matter strove to attain an equilibrium the first instinct was present that to return to lifelessness The living substance at that time had death within easy reach there was probably only a short course of life to run the direction of which was determined by the chemical structure of the young organism So through a long period of time the living substance may have been constantly created anew and easily extinguished until decisive external influences altered in such a way as to compel the still surviving substance to ever greater deviations from the original path of life and to ever more complicated and circuitous routes to the attainment of the goal of death These circuitous ways to death faithfully retained by the conservative instincts would be neither more nor less than the phenomena of life as we now know it If the exclusively conservative nature of the instincts is accepted as true it is impossible to arrive at any other suppositions with regard to the origin and goal of life

If these con l s o s sound strangely in our ears equally s will those we are led t make concernin the great groups of nst ncts which we rega d as lying behind the vit l phenomena of rganisms The postulate of the *self preservative instincts* we ascribe to every li ing be ng stands in rema kable c ntrast to the suppos tion that the wh le life f instu ct serves the one end of bringing abo t death. The theoretic significance f the instincts of elf preservation power and self-assert n shrinks to nothing seen in this light they re part insti cts designed to secure the path t death peculiar to th organism and to ward off poss bilit es of return to th inorganic othe than the immanent ones but the e gm tic struggle of the organ *ism to maintain itself in p t* of all the wo ld a struggle that cannot be brought into connec tio with a ything else disappears It rema ns to be added that the rgan sm s resol ed to d only in ts own way e en these watchmen *of life were originally the myrmidons of death.* Hence, the parado c mes bout that the l n g rganism resi ts with all ts en rgy influences (dangers) which c ld h lp t to rea h its l fe goal by sh rt way (a short circuit so to speak) but this s just the beha our that characterize a pu e instinct as c ntrasted with an intelligent triving

But w must bethi k o rsel es this ca n t be the whol truth. also lose the significance we have attributed to it.

Let us turn back, therefore, to one of the assumptions we interpolated in the expectation that it will permit of exact refutation. We built up further conclusions on the basis of the assumption that all life must die from internal causes. We made this assumption so light heartedly because it does not seem to us to be one. We are accustomed so to think, and every poet encourages us in the idea. Perhaps we have resolved so to think because there lies a certain consolation in this belief. If man must himself die, after first losing his most beloved ones by death, he would prefer that his life be forfeit to an inexorable law of nature, the sublime Ananke, than to a mere accident which perhaps could have been in some way avoided. But perhaps this belief in the incidence of death as the necessary consequence of an inner law of being is also only one of those illusions that we have fashioned for ourselves so as to endure the burden of existence. It is certainly not a primordial belief. The idea of a *natural death* is alien to primitive races; they ascribe every death occurring among themselves to the influence of an enemy or an evil spirit. So let us not neglect to turn to biological science to test the belief.

If we do so we may be astonished to find how little agreement exists among biologists on the question of natural death, that indeed the very conception of death altogether eludes them. The fact of a certain average length of life, at least among the higher animals, is of course an argument for death from inner causes, but the circumstance that certain large animals and giant trees reach a very great age cannot be computed up to now once more removes this impression. According to the grandiose conception of W. Fliess all the vital phenomena—and certainly also death—are linked with the accomplishment of certain periods of time, among which there finds expression the dependence of two living substances, one male and one female, upon the solar year. But observations of how easily and extensively the influences of external forces can alter vital manifestations, especially in the plant world, as to their occurrence in time, can hasten or retard them, militate against the rigidity of the formulae laid down by Fliess, and leaves at least doubtful the universality of the laws he sought to establish.

The treatment of these themes, death and the duration of life among organisms, in the works of A. Weismann possesses the greatest interest for us. This investigator originated the distinction of living substance into a mortal and an immortal half; the mortal is the body in the narrower sense, the soma, which alone is subject to natural death, while the germ cells are potentially immortal in so far as they are capable under certain favourable conditions of developing into a new individual, or expressed otherwise, of surrounding themselves with a new soma.

What here arrests our attention is the unexpected analogy with our conception developed along so different a line of thought. Weismann, who is considering living substance morphologically, recognizes in it a constituent which is the prey of death, the soma, the body viewed apart from sex or heredity elements, and on the other hand an immortal part, the germ plasm, which serves the purpose of preservation of the species, of propagation. We have fixed our attention not on the living matter but on the forces active in it, and have been led to distinguish two kinds of instincts: those the purpose of which is to guide life towards death, and the others, the sexual instincts, which perpetually strive for and bring about the renewal of life. This sounds like a dynamic corollary to Weismann's morphological theory.

This appearance of an important correspondence vanishes as soon as we examine Weismann's pronouncement on the problem of death. For Weismann admits the differentiation between the mortal soma and the immortal germ-plasm only in relation to multicellular organisms; with the unicellular beings the individual and the reproductive cell are still one and the same. The unicellular he thus affirms to be potentially immortal; death appears only among the metazoa, the multicellular. This death of the higher organisms is, it is true, a natural one, a death from inner causes, but it does not depend on an inherent quality of the living substance; is not to be conceived as an absolute necessity based on the nature of life. Death is rather a purposive contrivance, a phenomenon of adaptation to the external conditions of life, because after the differentiation of the corporeal cells into soma and germ-plasm the indefinite prolongation of the life of the

the characteristic I have su gested The exist ence of a general impulse towards higher development in the plant and animal world can certainly not be established though some such line of development is as a fact unquestionable But on the one hand it is often merely a question of our own valuation when we pronounce one stage of development to be higher than another and on the other hand biology makes clear to us that a higher development in one particular is often purchased with or balanced by retrogression in another Then there are plenty of animal forms the youthful stages of which teach us that their development has taken a retrograde character rather than otherwise Higher development and retrogression alike might well be the results of external forces impelling towards adaptation and the part played by the instincts might be confined in both cases to retaining the enforced changes as sources of pleasure

Many of us will also find it hard to abandon our belief that in man himself there dwells an impulse towards perfection which has brought him to his present hei hts of intellectual prowess and ethical sublimation and from which it might be expected that his development into superman will be ensured But I do not believe in the existence of such an inner impulse and I see no way of preserving this pleasing illusion The development of man up to now does not seem to me to need any explanation differing from that of animal development and the restless striving towards further perfection which may be observed in a minority of human beings is easily explicable as the result of that repression of instinct upon which what is most valuable in human culture is built The repressed instinct never ceases to strive after its complete satisfaction which would consist in the repetition of a primary experience of satisfaction all substitution or reaction formations and sublimations avail nothing towards relaxing the continual tension and out of the excess of the satisfaction demanded over that found is born the driving momentum which allows of no abiding in any situation presented to it but in the poet s words urges ever forward ever unsubdued The path in the other direction back to complete satisfaction is as a rule barred by the resistances that maintain the repressions and thus there remains nothing for it but to proceed in the other still unobstructed direction that of development without however any prospect of being able to bring the process to a conclusion or to attain the goal. What occurs in the development of a neurotic phobia which is really nothing but an attempt at flight from the satisfaction of an instinct gives us the prototype for the origin of this ostensible impulse towards perfection which however we cannot possibly ascribe to all human beings The dynamic conditions are it is true quite generally present but the economic relations seem only in rare cases to favour the phenomenon

OUR discussion so far results in the establishing of a sharp antithesis between the *ego instincts* and the sexual instincts the former impelling towards death and the latter towards the preservation of life a result which we ourselves must surely find in many respects far from adequate Further only for the former can we properly claim the conservative—or better regressive—character corresponding to a repetition compulsion For according to our hypothesis the ego instincts spring from the vitalizing of inanimate matter and have as their aim the reinstatement of lifelessness As to the sexual instincts on the other hand it is obvious that they reproduce primitive states of the living being but the aim they strive for by every means is the union of two germ cells which are specifically differentiated If this union does not take place then the germ cell dies like all other elements of the multicellular organism Only on this condition can the sexual function prolong life and lend it the semblance of immortality Of what important happening then in the process of development of the living substance is sexual reproduction or its forerunner the copulation of two individual protozoa the repetition? That question we do not know how to answer and therefore we should feel relieved if the whole structure of our arguments were to prove erroneous The opposition of ego- (or death) instincts and sexual (life) instincts would then disappear and the repetition compulsion would thereupon

Meph t ph les in F t F t I F t St dy

had this effect in bringing about the death of the generation. For in a solution over-saturated with waste products of a distantly related species the very same animalculae throve excellently which when allowed to accumulate in their own nutrient fluid inevitably perished. Thus, left to itself the infusorium dies a natural death from the imperfect disposal of its own metabolic products; perhaps all higher animals die ultimately from the same inability.

At this point, the doubt may then occur to us whether any good purpose has been served in looking for the answer to the question as to natural death in the study of the protozoa. The primitive organization of these forms of life may conceal from us important conditions which are present in them too but can be recognized only among the higher animals where they have achieved for themselves a morphological expression. If we abandon the morphological point of view for the dynamic it may be a matter of entire indifference to us whether the natural death of the protozoa can be proved or not. With them the substance later recognized as immortal has not yet separated itself in any way from the part subject to death. The instinctive forces which endeavour to conduct life to death might be active in them too from the beginning and yet their effect might be so obscured by that of the forces tending to preserve life that any direct evidence of their existence becomes hard to establish. We have heard, it is true, that the observations of biologists allow us to assume such death-ward tending processes also among the protozoa. But even if the protozoa prove to be immortal in Weismann's sense, his assertion that death is a late acquisition holds good only of the out-

ory would entirely put out of court any recognition of the death instincts has not been fulfilled. It is open to us to occupy ourselves further with this possibility if we have other reasons for doing so. The striking resemblance between Weismann's separation of soma and germ-plasm and our distinction between the death and the life-instincts remains unshaken moreover and retains its value.

Let us dwell for a moment on this quite ly dualistic conception of the instinctive life. According to E. Hering's theory of the processes in living matter there course through it uninterruptedly two kinds of processes of opposite direction: one anabolic, assimilatory, the other katabolic, disintegrating. Shall we venture to recognize in these two directions of the vital processes the activity of our two instinctive tendencies, the life-instincts and the death-instincts? And we cannot disguise another fact from ourselves: that we have steered unawares into the haven of Schopenhauer's philosophy, for whom death is the "real result" of life and therefore in so far its aim, while the sexual instinct is the incarnation of the will to live.

Let us boldly try to go a step further. According to general opinion the union of numerous cells into one vital connection, the multicellularity of organisms, has become a *means to the prolongation of their span of life*. One cell helps to preserve the life of the others and the cell-community can go on living even if single cells have to perish. We have already heard that also *conjugation*, the temporary mingling of two unicellular entities, has a preservative and rejuvenating effect on both. The attempt might consequently be made to transfer the libido theory yielded by psycho-analysis to the relationship of the cells to one another and to imagine that it is the vital or sexual instincts active in every cell that take the other cells for their *object*, partially neutralize their death-instincts, i.e. the processes stimulated by these, and so preserve those cells in life, while other cells do the same for them, and still others sacrifice themselves in the exercise of this libidinous function. The germ-cells themselves would behave in a completely *narcissistic* fashion, as we are accustomed to describe it in the theory of the neuroses when an individual concentrates his libido on the ego and gives out none of it for the charging of objects. The germ-cells need their libido—the activity of their vital *instincts—for them*selves as a provision for their later enormous constructive activity. Perhaps the cells of the malignant growths that destroy the organism can also be considered to be narcissistic in the same sense. *Pathology is, as indeed prepared* to regard the kernels of them as congenital and to ascribe embryonal attributes to them. Thus the libido of our sexual instincts would coincide with the Eros of poets and philosophers which holds together all things living.

At this point, opportunity offers of reviewing the gradual development of our libido theory. The analysis of the transference neuroses

Über die anscheinende Absichtlichkeit im Schicksale des Einzelnen (edited by Grand Duke Wilhelm Ernst) Vol IV p. 68

individual would have become a quite inexpedient luxury. With the appearance of this differentiation among multicellular organisms death became possible and expedient. Since then the soma of the higher organisms dies after a certain time from internal causes; the protozoa however remain immortal. Propagation on the other hand was not first introduced with death, it is on the contrary a primordial property of living matter like growth, in which it originated and life has gone on uninterruptedly from its inception on the earth.

It is easy to see that to concede natural death to the higher organisms does not greatly help our case. If death is a late acquisition of life then death instincts traceable to the beginning of life on this planet no longer come into question. Multicellular organisms may continue to die from internal causes, whether defect of differentiation or imperfections of their metabolism; it possesses no interest for the inquiry on which we are engaged. Such a conception and derivation of death certainly more nearly approaches the ordinary human view of it than the unwonted assumption of *death instincts*.

The discussion which has centred round Weismann's assertions has in my opinion had no decisive result in any direction. Many writers have reverted to the standpoint of Goethe (1883) who saw in death the direct consequence of propagation. Hartmann does not regard as the characteristic of death the appearance of a *corpse*, a piece of living substance which has *died off*, but defines it as the definitive end of individual development. In this sense protozoa are also subject to death; with them death invariably coincides with propagation, but it is so to speak disguised by the latter, for the whole substance of the parent organism may be absorbed directly into the new individuals.

The interest of the in[illegible]

[illegible] an American named Woodruff instituted a culture of a ciliated infusorium, a *slipper animalcule*, which reproduces itself by division into two individuals; each time he isolated one of the products and put it into fresh water. He traced the propagation to the 3,029th generation when he discontinued the experiment. The last descendant of the first slipper animalcule was just as lively as its original ancestor without any sign of age or degeneration; if such numbers are convincing, the immortality of protozoa seemed thus experimentally demonstrable.

Other investigators have arrived at other results. Maupas, Calkins, etc., found in contradiction to Woodruff that even these infusoria after a certain number of divisions become weaker, decrease in size, lose a portion of their organization and finally die, if they do not encounter certain invigorating influences. According to this protozoa die after a phase of senile decay just like higher animals, in direct contravention of what is maintained by Weismann, who recognizes in death a late acquisition of living organisms.

Taking the net result of these researches together we note two facts which seem to afford us a firm foothold. First, if the animalculae at a time when they as yet show no signs of age have the opportunity of mingling with each other, of *conjugating*—afterwards again separating—then they remain exempt from age, they have been *rejuvenated*. This conjugation is doubtless the prototype of sexual propagation of higher organisms; as yet it has nothing to do with multiplication, it is confined to the mingling of the substances of both individuals (Weismann's *Amphimixis*). The invigorating influence of conjugation can also be replaced however by certain modes of stimulation, changes in the composition of the nutrient fluid, raising of temperature, or shaking. The famous experiment of J. Loeb will be recalled who by the application of certain chemical stimuli to the ova of sea urchins brought about processes of division which usually take place only after fertilization.

Secondly, it is after all probable that the infusoria are brought to a natural death through their own vital process, for the contradiction between Woodruff's findings and those of others arises from Woodruff having placed each generation in fresh nutrient fluid. When he refrained from doing so he observed, as did the other investigators, that the generations showed signs of age. He concluded that the animalculae were injured by the products of metabolism which they gave off into the surrounding fluid and was then able to prove convincingly that only the products of *its own* metabolism

Über Leben und Tod, [illegible] See M. Hartmann, [illegible] Alex. Lipschütz, [illegible] 1914, F. Doflein, [illegible] *Unsterblichkeit* [illegible] 1919

F[illegible] pp. 6[illegible] see Lipschütz, *op. cit.*

sharply than before, since we no longer call the contrasting tendencies *egoistic* and *sexual instincts*, but *life instincts* and *death instincts*. Jung's libido theory, on the other hand, is a monistic one; that he has applied the term *libido* to his only instinctive energy was bound to cause confusion but should not have any further effect on us. We suspect that there are in the ego other instincts than those of self-preservation, only we ought to be in a position to demonstrate them. Unfortunately so little progress has been made in the analysis of the ego that this proof becomes extraordinarily difficult of attainment. The libidinous instincts of the ego may indeed be conjoined in a special way with other ego-instincts of which we as yet know nothing. Before ever we had clearly recognized narcissism the conjecture was already present in the minds of psycho-analysts that the *ego-instincts* had drawn libidinous components to themselves. But these are merely vague possibilities which our opponents will hardly take into account. It remains an awkward fact that analysis up to now has only put us in the position of demonstrating libidinous impulses. The conclusion that therefore there are no others is one to which we do not assent.

In the obscurity that at present shrouds the theory of instinct, we shall certainly not do well to reject any idea that promises to throw light. We have made the antithesis between the life and death instincts our point of departure. Object love itself displays a second such polarity, that of love (tenderness) and hate (aggression). What if we could succeed in bringing these two polarities into relation with each other in tracing the one to the other. We have long recognized sadistic components of the sexual instinct; it can, as we know, attain independent and perversion, dominating the whole sexual trend of a person. In one of the organizations which I have termed *pregenital* it appears as a dominating part instinct. But how is one to derive the sadistic impulse which aims at the injury of the object from the life-sustaining Eros. Does not the assumption suggest itself that this sadism is properly a death-instinct which is driven apart from the ego by the influence of the narcissistic libido so that it becomes manifest only in reference to the object. It then enters the service of the sexual function; at the oral stage of organization of the libido amorous possession is still one and the same as annihilation of the object; later the sadistic impulse separates itself and at last at the stage of the genital primacy it takes over with the aim of propagation the function of so far overpowering the sex-object as the carrying out of the sexual act demands. One might even say that the sadism expelled from the ego has acted as guide to the libidinous components of the sexual instinct; these later press on towards the object. Where the original sadism experiences no abatement or fusion, the well known hate-love ambivalence of the love-life is set up.

If the above assumption is justifiable, then we have met the challenge of demonstrating an example of a death instinct—though a displaced one. This conception, however, is far from being evident and creates a frankly mystical impression. We incur the suspicion of having attempted at all costs to find a way out of an impasse. We may appeal against this verdict by saying that the assumption is no new one; that we have once before made it when there was no question of an impasse. Clinical observations forced upon us the view that the part instinct of masochism, the one complementary to sadism, is to be understood as a recoil of the sadism on to the ego itself. A turning of the instinct from the object to the ego is, however, essentially the same as a turning from the ego to the object, which is just now the new idea in question. Masochism, the turning of the instinct against the self, would then be in reality a return to an earlier phase of this, a regression. The exposition I then gave of masochism needs correction in one respect as being too exclusive; masochism may also be what I was there concerned to deny, primary.

Let us return however to the life-sustaining sexual instincts. We have already learned from the investigation of the protozoa that the mingling of two individuals without consequent

Three Contributions to the Theory of Sex.

forced on our notice in the first place the opposition between *sexual instincts* which are directed towards an object and other instincts which we only imperfectly discerned and pro visionally described as *ego instincts* Among the latter those which subserve the self preserva tion of the individual had the first claim for recognition What other distinctions were to be made it was impossible to say No knowl edge would have been so important for the establishment of a sound psychology as some approximate understanding of the common na ture and possible differences of the instincts But in no department of psychology did one grope more in the dark Everyone posited as many instincts or *fundamental instincts* as he pleased and contrived with them just as the ancient Greek philosophers did with their four elements earth air fire and water Psycho analysis which could not dispense with some kind of hypothesis as to the instincts adhered to begin with to the popular distinction typi cally represented by the phrase *hunger and love* It was at least no new arbitrary creation With this one adequately covered a consider able distance in the analysis of the psycho-neuroses The conception of *sexuality*—and therewith that of a sexual instinct—certainly had to be extended till it included much that did not come into the category of the function of propagation and this led to outcry enough in a severe and superior or merely hypocritical world

The next step followed when psycho analysis was able to feel its way a little nearer to the psychological ego which was at first known to us only as a repressing censoring agency capable of constituting defences and reaction formations Critical and other far seeing minds had indeed for a long time raised objections to the narrowing of the libido concept down to the energy of the sexual instinct as directed to the object But they omitted to say whence they obtained this fuller comprehension and failed to deduce anything from it of [illegible]

[illegible] and directed towards the ego (introversion) and through the study of the libido-development of the child in its earliest phases it became clear that the ego is the true and original reservoir of the libido which is extended to the object only from this The ego took its place as one of the sexual objects and was immediately recognized as the choicest among them Where the libido thus remained attached to the ego it was termed *narcissistic*[1] This narcissistic libido was naturally also the expression of the energy of sexual instincts in the analytical sense which now had to be identi fied with the *instincts of self preservation* the existence of which was admitted from the first. Whereupon the original antithesis between the ego instincts and the sexual instincts became inadequate A part of the e o-instincts was recognized as libidinous in the ego exual instincts were found to be active—probably in addition to others nevertheless one is justified in saying that the old formula viz that a psychoneurosis arises out of a conflict between the ego instincts and the sexual instincts con tained nothing that we should have to reject today Only the difference of the two kinds of instincts which was supposed originally to be in some kind of way qualitative has now to be defined otherwise namely on a topographical basis In particular the transference neurosis the real object of psycho analytic study is still seen to be the result of a conflict between the ego and libidinous investment of an object

We are the more compelled now to accen tuate the libidinous character of the self pre servative instincts since we are venturing on the further step of recognizing the sexual in stinct as the Eros the all sustaining and of deriving the narcissistic libido of the ego from the sum of the libido quantities that bring about the mutual adherence of the somatic cells B[illegible] we now [illegible] this que[illegible] are also [illegible] have no [illegible] instincts at all than libidinous ones There are at least no others apparent In that event we must admit the critics to be in the right who from the first have su pected that psycho analysis makes sexuality the expla nation of everything or the innovators like Jung who quickly making up their minds have used *libido* as a synonym for *instinctive force* in general Is that not so?

This result was at all events one not intended by us On the contrary we took as our starting point a sharp distinction between the ego instincts (=death instincts) and the sexual instincts (=life instincts) We were prepared indeed to reckon even the alleged self pre er vative instincts of the ego among death instincts a position which we have since corrected and withdrawn from Our standpoint was a dualistic one from the beginning and is so today more

[1] See O [illegible] p 399 above.

sharply than before since we no longer call the contrasting tendencies *egoistic* and *sexual* instincts, but *life-instincts* and *death-instincts*. Jung[1] theory on the other hand is a monistic one; that he has applied the term libido to his only instinctive energy was bound to create confusion, but should not have any further effect on us. We suspect that there are in the ego other instincts than those of self-preservation; only we ought to be in a position to demonstrate them. Unfortunately so little progress has been made in the analysis of the ego that this proof becomes extraordinarily difficult of attainment. The libidinous instincts of the ego may indeed be conjoined in a special way with other ego-instincts of which we as yet know nothing. Before ever we had clearly recognized narcissism, the conjecture was already present in the minds of psycho-analysts that the ego-instinct had drawn libidinous components to themselves. But these are merely vague possibilities which our opponents will hardly take into account. It remains an awkward fact that analysis up to now has only put us in the position of demonstrating libidinous impulses. The conclusion that therefore there are no others is one to which we do not assent.

In the obscurity that at present surrounds the theory of instinct, we shall certainly not do well to reject any idea that promises to throw light. We have made the antithesis between the life- and death-instincts our point of departure. Object-love itself displays a second such polarity, that of love (tenderness) and hate (aggression). What if we could succeed in bringing these two polarities into relation with each other, in tracing the one to the other! We have long recognized a sadistic component of the sexual instinct;[2] it can, as we know, attain independence and as a perversion, dominate the whole sexual trend of a person. In one of the organizations which I have termed *pregenital* it appears as a dominating part instinct. But how is one to derive the sadistic impulse which aims at the injury of the object, from the life-sustaining Eros? Does not the assumption suggest itself that this sadism is properly a death-instinct which is driven apart from the ego by the influence of the narcissistic libido so that it becomes manifest only in reference to the object? It then enters the service of the sexual function; at the oral stage of organization of the libido amorous possession is still one and the same as annihilation of the object;

later the sadistic impulse separates itself and, at last at the stage of the genital primacy it takes over with the aim of propagation the function of so far overpowering the sex-object as the carrying out of the sexual act demands. One might even say that the sadism expelled from the ego has acted as guide to the libidinous components of the sexual instinct; these later press on towards the object. Where the original sadism experiences no abatement or fusion, the well known hate-love ambivalence of the love-life is set up.

If the above assumption is justifiable then we have met the challenge of demonstrating an example of a death instinct—though a displaced one. This conception however is far from being evident, and creates a frankly mystical impression. We incur the suspicion of having attempted at all costs to find a way out of an *impasse*. We may appeal against this verdict by saying that the assumption is no new one; that we have once before made it when there was no question of an *impasse*. Clinical observations forced upon us the view that the part instinct of masochism, the one complementary to sadism, is to be understood as a recoil of the sadism on to the ego itself. A turning of the instinct from the object to the ego is, however, essentially the same as a turning from the ego to the object, which is just now the new idea in question. Masochism, the turning of the instinct against the self would then be in reality a return to an earlier phase of this, a regression. The exposition I then gave of masochism needs correction in one respect as being too exclusive; masochism may also be what I was there concerned to deny: primary.

Let us return however to the life-sustaining sexual instinct. We have already learned from the investigation of the protozoa that the mingling of two individuals without consequent

[1] See *The Contributions to the Theory of Sex* and *Instincts and their Vicissitudes* [illegible] above.

[2] *Three Contributions to the Theory of Sex.*

[illegible] *[Sabina] S[pielrein] and Destruction [illegible] Entstehung [des] Werdens* [illegible] has attempted to identify the libido concept itself with the theoretical concept of an impulsion towards death which is to be assumed on theoretical grounds. (See also Rank, *Der Künstler*.) All these attempts as the one in the text, indicate how much the need is felt for clarification in the theory of instinct, which we do not yet possess.

partition just as copulation between two individuals which soon after separate has a strengthening and rejuvenating effect (see above Lipschutz) There is no sign of degeneration in their descendants and they also seem to have gained the capacity for withstanding for a longer time the injurious results of their own metabolism I think that this one observation may be taken as a prototype of the effect of sexual intercourse also But in what way does the blendin of two slightly different cells bring about such a renewal of life? The experiment which substitutes for conjugation among protozoa the effect of chemical or even of mechanical stimuli admits of our giving a reply with certainty it comes about by the introduction of new stimulus masses This is in close agreement with the hypothesis that the life process of an individual leads from internal causes to the equalizing of chemical tensions i e to death while union with an individually different living substance increases these tensions—so to speak introduces new vital differentia which then have to be again lived out For this difference between the two there must naturally be one or more optima Our recognition that the ruling tendency of psychic life perhaps of nerve life altogether is the struggle for reduction keeping at a constant level or removal of the inner stimulus tension (the Nirvana principle as Barbara Low terms it) —a struggle which comes to expression in the pleasure principle—is indeed one of our strongest motives for believing in the existence of death instincts

But the course of our argument is still disturbed by an uneasy feelin that just in the case of the sexual instinct we are unable to demonstrate that character of a repetition compulsion which first put us on the track of the death instincts It is true that the realm of embryonic developmental processes offers an abundance of such repetition phenomena—the two germ cells of sexual propagation and their life history are themselves only repetitions of the beginning of organic life but the essential feature in the processes designed by the sexual instinct is nevertheless the mingling of two cells Only by this is the immortality of the living substance among the higher forms of life assured

To put it in other words we have to make enquiry into the origin of sexual propagation and the source of the sexual instincts in general a task before which the lay mind quails and which even specialists have not yet been able to solve Let us therefore make a condensed selection from all the conflicting accounts and opinions of whatever can be brou ht in o relation with our train of thought

One view deprives the problem of propagation of its mysterious attraction by representing it as part of the phenomenon of growth (multiplication by division germination budding) The arising of propagation by means of germ cells sexually differentiated mi ht be conceived in accordance with the sober Darwinian mode of though as a way of maintaining and utilizing for further development the advantage of the amphimixis which resulted in the first instance from the fortuitous conjugation of two protozoa *Sex* would not thus be of very ancient origin and the extraordinarily powerful instincts which aim at brin ing about sexual union would thereby repeat something which once chanced to happen and since became established as being advantageous

The same question now recurs as arose in respect of death—namely whether the protozoa can be credited with anything beyond what they exhibit and whether we may assume that forces and processes which become perceptible only in the case of the hi her animal did first arise in the more primitive For our purpose the view of sexuality mentioned above helps very little The objection may be raised against it that it presupposes the existence of life instincts as already operative in the simplest forms of life for otherwise conjugation which works against the expiration of life and makes the task of dying harder would not have been retained and elaborated but would have been avoided If then we are not to abandon the hypothesis of death instincts maintained we must associate them with life instincts from the be inning But we must admit that we are working here at an equation with two unknown quantities Anything el e that science can tell us of the origin of sexuality amounts to so little that this problem may be likened to an obscurity into which not even the ray of an hypothesis has penetrated In quite another quarter however we encounter such an hypothesis but it is of so fantastic a kind—assuredly a myth rather than a scientific explanation—

where they are concerned with the ultimate things the great problems of science and of life My belief is that there everyone is under the sway of preferences deeply rooted within into the hands of which he unwittin ly plays as he pursues his speculation Where there are such good grounds for distrust only a tepid feeling of indulgence is possible towards the results of one s own mental labours But I hasten to add that such self criticism does not render obligatory any special tolerance of diver ent opinions One may inexorably reject theories that are contradicted by the very first steps in the analysis of observation and yet at the same time be aware that those one holds oneself have only a tentative validity Were we to appraise our speculations upon the life and death instincts it would disturb us but little that so many processes go on which are surprisin and hard to picture such as one instinct being expelled by others or turning from the ego to an object and so on This comes only from our being obliged to operate with scientific terms i e with the metaphorical expressions peculiar to psychology (or more correctly psychology of the deeper layers) Otherwise we should not be able to describe the corresponding processes at all nor in fact even to have remarked them The shortcomings of our description would probably disappear if for the psychological terms we could substitute physiological or chemical ones These too only constitute a metaphorical language but one familiar to us for a much longer time and perhaps also simpler

On the other hand we wish to make it quite clear that the uncertainty of our speculation is enhanced in a high degree by the necessity of borrowing from biological science Biology is truly a realm of limitless possibilities we have the most surprisin revelations to expect from it and cannot conjecture what answers it will offer in some decades to the questions we have put to it Perhaps they may be such as to over throw the whole artificial structure of hypoth eses If that is so someone may ask why does one undertake such work as the one set out in this art ¹

If this attempt to reinstate an earlier con dition really is so universal a characteristic of the instincts we should not find it surpri n that so many processes in the psychic life are performed independently of the pleasure prin ciple This characteristic would communicate itself to every part instinct and would in that case concern a harking back to a definite point on the path of development But all that the pleasure principle has not yet acquired power over is not therefore necessarily in opposition to it and we have not yet solved the problem of determining the relation of the instinctive repetition processes to the domination of the pleasure principle

We have recognized that one of the earliest and most important functions of the psychic apparatus is to *bind* the instreaming instinctive excitations to substitute the *secondary process* for the *prima y process* dominatin them and to transform their freely mobile energy charge into a predominantly quiescent (tonic) charge During this transformation no attention can be paid to the development of the pain but the pleasure principle is not thereby annulled On the contrary the transformation takes place in the service of the pleasure principle the binding is an act of preparation which intro duces and secures its sovereignty

Group Psychology and the Analysis of the Ego

I Introduction

THE contrast between individual psychology and social or group psychology which at a first glance may seem to be full of significance loses a great deal of its sharpness when it is examined more closely It is true that individual psychology is concerned with the individual man and explores the paths by which he seeks to find satisfaction for his instincts but only rarely and under certain exceptional conditions is individual psychology in a position to disregard the relations of this individual to others In the individual s mental life someone else is invariably involved as a model as an object as a helper as an opponent and so from the very first individual psycholo y is at the same time social psychology as well—in this extended but entirely justifiable sense of the words

The relations of an individual to his parents and to his brothers and sisters to the object of his love and to his physician—in fact all the relations which have hitherto been the chief subject of psycho analytic research—may claim to be considered as social phenomena and in this respect they may be contrasted with certain other processes described by us as *na cis sistic* in which the satisfaction of the in tincts is partially or totally withdrawn from the influence of other people The contrast between social and narcissistic—Bleuler would perhaps call them *autistic*—mental acts therefore falls wholly within the domain of individual psychology and is not well calculated to differentiate it from a social or group psychology

The individual in the relations which have already been mentioned—to his parents and to his brothers and sisters to the person he is in love with to his friend and to his physician—comes under the influence of only a single person or of a very small number of persons each one of whom has become enormously important to him Now in speaking of social or group p ychology it has become usual to leave the e relations on one side and to isolate as the subject of inquiry the influencing of an individual by a large number of people simultaneously people with whom he is connected by something though otherwise they may in many respects be strangers to him Group psychology is therefore concerned with the individual man as a member of a race of a nation of a caste of a profession of an institution or as a component part of a crowd of people who have been organized into a group at some particular time for some definite purpose When once natural continuity has been severed in this way it is easy to regard the phenomena that appear under these special conditions as bein expres ions of a special instinct that is not further reducible the social instinct (herd instinct group mind) which does not come to light in any other situations But we may perhaps venture to object that it eems difficult to attribute to the factor of number a significance so great as to make it capable by it elf of arousin in our mental life a new instinct that is otherwise not brought into play Our expectation is therefore directed towards two other possibilities that the social instinct may not be a primitive one and insusceptible of dis ection and that it may be possible to discover the beginnings of its development in a narrower circle such as that of the family

Although group psycholo y is only in its infancy it embraces an immense number of separate issues and offers to investigators countless problems which have hitherto not even been properly distinguished from one another The mere classification of the different forms of group formation and the description of the mental phenomena produced by them require a great expenditure of observation and exposition and have already given ri e to a copious literature Anyone who compares the narrow dimen ions of this little book with the extent of group psychology will at once be able to guess that only a few points chosen from the whole material are to be dealt with here

G oup Is u ed th gh t th t l t eq l t t the th m mp h Ge m M Th th th l tt w d t d both M D gall g p d l Le B f l wh h w ld m t lly be t l t d ed E l h Fo th sak f u f m ty h w g p h bee p l ed i th w ll d has bee subst t ted fo owd i th t ts f m th E gl sh t a l t n of Le B —TR.

And they will in fact only be a few questions with which the depth psychology of psychoanalysis is specially concerned.

II. LE BON'S DESCRIPTION OF THE GROUP MIND

INSTEAD of starting from a definition, it seems more useful to begin with some indication of the range of the phenomena under review and to select from among them a few specially striking and characteristic facts to which our inquiry can be attached. We can achieve both of these aims by means of quotation from Le Bon's deservedly famous work, *Psychologie des Foules*.

Let us make the matter clear once more. If a psychology concerned with exploring the predispositions, the instincts, the motives and the aims of an individual man down to his actions and his relations with those who are nearest to him, had completely achieved its task, and had cleared up the whole of these matters with their inter-connections, it would then suddenly find itself confronted by a new task which would lie before it unachieved. It would be obliged to explain the surprising fact that under a certain condition this individual whom it had come to understand thought, felt and acted in quite a different way from what would have been expected. And this condition is his insertion into a collection of people which has acquired the characteristic of a 'psychological group.' What, then, is a 'group'? How does it acquire the capacity for exercising such a decisive influence over the mental life of the individual? And what is the nature of the mental change which it forces upon the individual?

It is the task of a theoretical group psychology to answer these three questions. The best way of approaching them is evidently to start with the third. Observation of the changes in the individual's reactions is what provides group psychology with its material; for every attempt at an explanation must be preceded by a description of the thing that is to be explained.

I will now let Le Bon speak for himself. He says: "The most striking peculiarity presented by a psychological group is the following. Whoever be the individuals that compose it, however like or unlike be their mode of life, their occupations, their character, or their intelligence, the fact that they have been transformed into a group puts them in possession of a sort of collective mind which makes them feel, think, and act in a manner quite different from that in which each individual of them would feel, think, and act were he in a state of isolation. There are certain ideas and feelings which do not come into being, or do not transform themselves into acts except in the case of individuals forming a group. The psychological group is a provisional being formed of heterogeneous elements, which for a moment are combined, exactly as the cells which constitute a living body form by their reunion a new being which displays characteristics very different from those possessed by each of the cells singly" (p. 29).

We shall take the liberty of interrupting Le Bon's exposition with glosses of our own, and shall accordingly insert an observation at this point. If the individuals in the group are combined into a unity, there must surely be something to unite them, and this bond might be precisely the thing that is characteristic of a group. But Le Bon does not answer this question; he goes on to consider the alteration which the individual undergoes when in a group and describes it in terms which harmonize well with the fundamental postulates of our own depth psychology.

"It is easy to prove how much the individual forming part of a group differs from the isolated individual, but it is less easy to discover the causes of this difference.

"To obtain at any rate a glimpse of them it is necessary in the first place to call to mind the truth established by modern psychology, that unconscious phenomena play an altogether preponderating part not only in organic life, but also in the operations of the intelligence. The conscious life of the mind is of small importance in comparison with its unconscious life. The most subtle analyst, the most acute observer, is scarcely successful in discovering more than a very small number of the conscious motives that determine his conduct. Our conscious acts are the outcome of an unconscious substratum created in the mind in the main by hereditary influences. This substratum consists of the innumerable common characteristics handed down from generation to generation, which constitute the genius of a race. Behind the avowed causes of our acts there undoubtedly lie secret causes that we do not avow, but behind these secret causes there are many others more secret still, of which we ourselves are ignorant. The greater part of our

The Crowd: A Study of the Popular Mind (Fisher Unwin, 5th Impression, ...)
See footnote page 664.—TR.

References are to the English translation.—TR.

daily actions are the result of hidden motives which escape our observation (p 30)

Le Bon thinks that the particular acquirements of individuals become obliterated in a group and that in this way their distinctiveness vanishes The racial unconscious emerges what is heterogeneous is submerged in what is homogeneous We may say that the mental superstructure the development of which in individuals shows such dissimilarities is removed and that the unconscious foundations which are similar in everyone stand exposed to view

In this way individuals in a group would come to show an average character But Le Bon believes that they also display new characteristics which they have not previously possessed and he seeks the reason for this in three different factors

The first is that the individual forming part of a group acquires solely from numerical considerations a entiment of invincible power which allows him to yield to instincts which had he been alone he would perforce have kept under restraint He will be the less disposed to check himself from the consideration that a group being anonymous and in consequence irresponsible the sentiment of responsibility which always controls individuals disappears entirely (p 33)

From our point of view we need not attribute so much importance to the appearance of new characteristics For us it would be enough to say that in a group the individual is brought under conditions which allow him to throw off the repressions of his unconscious instincts The apparently new characteristics which he then displays are in fact the manifestations of this unconscious in which all that is evil in the human mind is contained as a predisposition We can find no difficulty in understanding the disappearance of conscience or of a sense of re ponsibility in these circumstances It has long been our contention that dread of so ciety *(so iale Angst)* is the essence of what is called *conscience*

The second cause which is contagion also intervenes to determine the manifestation in groups of their special characteristics and at the same time the trend they are to take Contagion is a phenomenon of which it is easy to establish the presence but that it is not easy to explain It must be classed amon those phenomena of a hypnotic order which we shall shortly study In a group every sentiment and act is contagious and contagious to such a degree that an individual readily sacrifices his personal interest to the collective interest. This is an aptitude very contrary to his nature and of which a man is scarcely capable except when he makes part of a group (p 33)

We shall later on base an important conjecture upon this last statement

A third cause and by far the most important determines in the individuals of a group special characteristics which are quite contrary at times to those presented by the isolated individual I allude to that su estibility of which moreover the contagion mentioned above is only an effect

To understand this phenomenon it is necessary to bear in mind certain recent physiological discoveries We know today that by various processes an individual may be brou ht into such a condition that having entirely lost his conscious personality he obeys all the suggestions of the operator who has deprived him of it and commits acts in utter contradiction with his character and habits The most careful investigations seem to prove that an individual immersed for some len th of time in a group in action soon finds himself—either in consequence of the magnetic influence given out by the group or from some other cause of which we are ignorant—in a special state which much resembles the state of fascination in which the hypnotized individual finds himself in the hands of the hypnotizer The conscious personality has entirely vanished will and discernment are lost All feelings and thou hts are bent in the direction determined by the hypnotizer

Such also is approximately the state of the individual forming part of a psychological group He is no longer conscious of his acts In his case as in the case of the hypnotized subject at the same time that certain faculties are destroyed others may be brought to a high degree of exaltation Under the influence of a su gestion he will undertake the accompli h ment of certain acts with irresistible impetuosity This impetuosity is the more irresistible in the case of groups than in that of the hypnotized subject from the fact that the suggestion

un erta y as al p oce ses. They m y t rally

It goes directly to extremes if a suspicion is expressed it is instantly changed into an incontrovertible certainty a trace of antipathy is turned into furious hatred (p 56)

Inclined as it itself is to all extremes a group can only be excited by an excessive stimulus Anyone who wishes to produce an effect upon it needs no logical adjustment in his arguments he must paint in the most forcible colours he must exaggerate and he must repeat the same thing again and again

Since a group is in no doubt as to what constitutes truth or error and is conscious moreover of its own great strength it is as intolerant as it is obedient to authority It respects force and can only be slightly influenced by kindness which it regards merely as a form of weakness What it demands of its heroes is strength or even violence It wants to be ruled and oppressed and to fear its masters Fundamentally it is entirely conservative and it has a deep aversion from all innovations and advances and an unbounded respect for tradition (p 62)

In order to make a correct judgment upon the morals of groups one must take into consideration the fact that when individuals come together in a group all their individual inhibitions fall away and all the cruel brutal and destructive instincts which lie dormant in individuals as relics of a primitive epoch are stirred up to find free gratification But under the influence of suggestion groups are also capable of high achievements in the shape of abnegation unselfishness and devotion to an ideal While with isolated individuals personal interest is almost the only motive force with groups it is very rarely prominent It is possible to speak of an individual having his moral standards raised by a group (p 65) Whereas the intellectual capacity of a group is always far below that of an individual its ethical conduct may rise as high above his as it may sink deep below it

Some other features in Le Bon's description show in a clear light how well justified is the identification of the group mind with the mind of primitive people In groups the most contradictory ideas can exist side by side and tolerate each other without any conflict arising from the logical contradiction between them But this is also the case in the unconscious mental life of individuals of children and of neurotics, as psycho analysis has long pointed out

A group further is subject to the truly magical power of words they can evoke the most formidable tempests in the group mind and are also capable of stilling them (p 117) Reason and arguments are incapable of combating certain words and formulas They are uttered with solemnity in the presence of groups, and as soon as they have been pronounced an expression of respect is visible on every countenance and all heads are bowed By many they are considered as natural forces as supernatural powers (p 117) It is only necessary in this connection to remember the taboo upon names among primitive people and the magical powers which they ascribe to names and words

And finally groups have never thirsted after truth They demand illusions and cannot do without them They constantly give what is

[illegible footnotes] … *The Interpretation of Dreams* … p 343 … p 386 … See *Totem and Taboo*

unreal precedence over what is real; they are almost as strongly influenced by what is untrue as by what is true. They have an evident tendency not to distinguish between the two (p. [illegible]).

We have pointed out that this predominance of the life of phantasy and of the illusion born of an unfulfilled wish is the ruling factor in the psychology of neuroses. We have found that what neurotics are guided by is not ordinary objective reality but psychological reality. A hysterical symptom is based upon phantasy instead of upon the repetition of real experience, and the sense of guilt in an obsessional neurosis is based upon the fact of an evil intention which was never carried out. Indeed, just as in dreams and in hypnosis, in the mental operations of a group the function of testing the reality of things falls into the background in comparison with the strength of wishes with their affective cathexis.

What Le Bon says on the subject of leaders of groups is less exhaustive, and does not enable us to make out an underlying principle so clearly. He thinks that as soon as living beings are gathered together in certain numbers, no matter whether they are a herd of animals or a collection of human beings, they place themselves instinctively under the authority of a chief (p. 134). A group is an obedient herd, which could never live without a master. It has such a thirst for obedience that it submits instinctively to anyone who appoints himself as its master.

Although in this way the needs of a group carry it half way to meet the leader, yet he too must fit in with it in his personal qualities. He must himself be held in fascination by a strong faith (in an idea) in order to awaken the group's faith; he must possess a strong and imposing will, which the group, which has no will of its own, can accept from him. Le Bon then discusses the different kinds of leaders, and the means by which they work upon the group. On the whole he believes that the leaders make themselves felt by means of the ideas in which they themselves are fanatical believers.

Moreover, he ascribes both to the ideas and to the leaders a mysterious and irresistible power, which he calls 'prestige'. Prestige is a sort of domination exercised over us by an individual, a work or an idea. It entirely paralyzes our critical faculty, and fills us with astonishment and respect. It would seem to arouse a feeling like that of fascination in hypnosis (p. 148).

He distinguishes between acquired or artificial and personal prestige. The former is attached to persons in virtue of their name, fortune and reputation, and to opinions, works of art, etc., in virtue of tradition. Since in every case it harks back to the past, it cannot be of much help to us in understanding this puzzling influence. Personal prestige is attached to a few people, who become leaders by means of it, and it has the effect of making everything obey them as though by the operation of some magnetic magic. All prestige, however, is also dependent upon success, and is lost in the event of failure (p. 159).

We cannot feel that Le Bon has brought the function of the leader and the importance of prestige completely into harmony with his brilliantly executed picture of the group mind.

III. OTHER ACCOUNTS OF COLLECTIVE MENTAL LIFE

WE have made use of Le Bon's description by way of introduction, because it fits in so well with our own psychology in the emphasis which it lays upon unconscious mental life. But we must now add that as a matter of fact none of that author's statements bring forward anything new. Everything that he says to the detriment and depreciation of the manifestations of the group mind had already been said by others before him with equal distinctness and equal hostility, and has been repeated in unison by thinkers, statesmen, and writers since the earliest periods of literature. The two theses which comprise the most important of Le Bon's opinions, those touching upon the collective inhibi[illegible]

are the two notions of the unconscious and of the comparison with the mental life of primitive people, and even these had naturally often been alluded to before him.

But, what is more, the description and estimate of the group mind as they have been given by Le Bon and the rest have not by any means been left undisputed. There is no doubt that all the phenomena of the group mind which have just been mentioned have been correctly ob-

B. Kraskovic, jun., *Die Psychologie der Kollektivitäten*

Sighele ... Stiermann and Schelzer, *Zeitschrift für ... Psychologie* and experimentelle Pädagogik, 1915, xvi.

served but it is also possible to distinguish other manifestations of the gr ... which on ... from ... mind ... below

Le Bon himself was prepared to admit that in certain circumstances the morals of a group can be higher than those of the individuals that compose it and that only collectivities are capable of a high degree of unselfishness and devotion While with isolated individuals personal interest is almost the only motive force with groups it is very rarely prominent (p 65) Other writers adduce the fact that it is only society which prescribes any ethical standards at all for the individual while he as a rule fails in one way or another to come up to its high demands Or they point out that in exceptional circumstances there may arise in communities the phenomenon of enthusiasm which has made the most splendid group achievements possible

As regards intellectual work it remains a fact indeed that great decisions in the realm of thought and momentous discoveries and solutions of problems are only possible to an individual working in solitude But even the group mind is capable of genius in intellectual creation as is shown above all by language itself as well as by folk song folk lore and the like It remains an open question moreover how much the individual thinker or writer owes to the stimulation of the group in which he lives or whether he does more than perfect a mental work in which the others have had a simultaneous share

In face of these completely contradictory accounts it looks as though the work of group psychology were bound to come to an ineffectual end But it is easy to find a more hopeful escape from the dilemma A number of very different formations have probably been merged under the term *group* and may require to be distinguished The assertions of Sighele Le Bon and the rest relate to groups of a short lived character which some passing interest has hastily a glomerated out of various sorts of individuals The characteristics of revolutionary groups and especially those of the great French Revolution have unmistakably influenced their descriptions The opposite opinions owe their origin to the cons deration of those stable groups or associations in which mankind pass their lives and which are embodied in the institutions of society Groups of the first kind stand in the same sort of relation to those of the second as a high but choppy sea to a ground swell

McDou all in his book on *The Group Mind* starts out from the same contradiction that has just been mentioned and finds a solution for it in the factor of organization In the simple t case he says the *group* possesses no organiza tion at all or one scarcely deservin the name He describes a group of this kind as a *crowd* But he admits that a crowd of human beings can hardly come together with ...

... cute psychology can be observed with special ease (p 2) Before the members of a random crowd of people can constitute something in the nature of a group in the psychological sense of the word a condition has to be fulfilled these individuals must have something in common with one another a common interest in an object a similar emotional bias in some situation or other and (consequently I h ...

... psychological group and the more striking are the manifestations of a group mind

The most remarkable and also the most important result of the formation of a group is the exaltation or intensification of emotion produced in every member of it (p 24) In McDougall s opinion men s emotions are stirred in a group to a pitch that they seldom or never attain under other conditions and it is a pleasurable experience for those who are concerned to surrender them elves so unreservedly to their passions and thus to become merged in the group and to lose the sen e of the limits of their individuality The manner in which individuals are thus carried away by a common impulse is explained by McDougall by means of what he calls the principle of direct induction of emotion by way of the primitive sympathetic response (p 25) that is by means of the emotional contagion with which we are already familiar The fact is that the perception of the signs of an emotional state is calculated automatically to arouse the same emotion in the person who perceives them The greater the number of people in whom the same emotion can be simultaneou ly observed the stronger does this automatic compulsion grow The individual loses his power of criticism and lets himself slip into the same emotion But in so

Camb dg U I ity Press 9 0

doing he increases the excitement of the other persons who had produced this effect upon him, and thus the emotional charge of the individuals becomes intensified by mutual interaction. Something is unmistakably at work in the nature of a compulsion to do the same as the others, to remain in harmony with the many. The coarser and simpler emotions are the more apt to spread through a group in this way (p. 39)

This mechanism for the intensification of emotion is favoured by some other influences which emanate from groups. A group impresses the individual with a sense of unlimited power and of insurmountable peril. For the moment, it replaces the whole of human society which is the wielder of authority, whose punishments the individual fears and for whose sake he has submitted to so many inhibitions. It is clearly perilous for him to put himself in opposition to it, and it will be safer to follow the example of those around him and perhaps even 'hunt with the pack'. In obedience to the new authority he may put his former conscience out of action, and so surrender to the attraction of the increased pleasure that is certainly obtained from the removal of inhibitions. On the whole, therefore, it is not so remarkable that we should see an individual in a group doing or approving things which he would have avoided in the normal conditions of life; and in this way we may even hope to clear up a little of the mystery which is so often covered by the enigmatic word 'suggestion'.

McDougall does not dispute the thesis as to the collective inhibition of intelligence in groups (p. 41). He says that the minds of lower intelligence bring down those of a higher order to their own level. The latter are obstructed in their activity because in general an intensification of emotion creates unfavourable conditions for sound intellectual work, and, further because the individuals are intimidated by the group and their mental activity is not free, and because there is a lowering in each individual of his sense of responsibility for his own performances.

The judgment with which McDougall sums up the psychological behaviour of a simple 'unorganized' group is no more friendly than that of Le Bon. Such a group 'is excessively emotional, impulsive, violent, fickle, inconsistent, irresolute and extreme in action, displaying only the coarser emotions and the less refined sentiments; extremely suggestible, careless in deliberation, hasty in judgment, incapable of any but the simpler and imperfect forms of reasoning; easily swayed and led, lacking in self-consciousness, devoid of self-respect and of sense of responsibility, and apt to be carried away by the consciousness of its own force, so that it tends to produce all the manifestations that we have learnt to expect of any irresponsible and absolute power. Hence its behaviour is like that of an unruly child or an untutored passionate savage in a strange situation, rather than like that of its average member; and in the worst cases it is like that of a wild beast, rather than like that of human beings' (p. 45).

Since McDougall contrasts the behaviour of a highly organized group with what has just been described, we shall be particularly interested to learn in what this organization consists ... The ... ons ... ber level.

The first and fundamental condition is that there should be some degree of continuity of existence in the group. This may be either material or formal: the former, if the same individuals persist in the group for some time; and the latter, if there is developed within the group a system of fixed positions which are occupied by a succession of individuals.

The second condition is that in the individual member of the group some definite idea should be formed of the nature, composition, functions and capacities of the group, so that from this he may develop an emotional relation to the group as a whole.

The third is that the group should be brought into interaction (perhaps in the form of rivalry) with other groups similar to it but differing from it in many respects.

The fourth is that the group should possess traditions, customs and habits, and especially such as determine the relations of its members to one another.

The fifth is that the group should have a definite structure, expressed in the specialization and differentiation of the functions of its constituents.

According to McDougall, if these conditions are fulfilled, the psychological disadvantages of the group formation are removed. The collective lowering of intellectual ability is avoided by withdrawing the performance of intellectual tasks from the group and reserving them for individual members of it.

It seems to us that the condition which McDougall designates as the 'organization' of

a group can with more justification be described in another way The problem consists in how to procure for the group precisely those features which were characteristic of the individual and which are extinguished in him by the formation of the group For the individual outside the primitive group possessed his own continuity his self consciousness his traditions and customs his own particular functions and position and kept apart from his rivals Owing to his entry into an unorganized group he had lost this distinctiveness for a time If we thus recognize that the aim is to equip the group with the attributes of the individual we shall be reminded of a valuable remark of Trotter s to the effect that the tendency towards the formation of groups is biolo ically a continuation of the multicellular character of all the hi her organisms

IV SUGGESTION AND LIBIDO

WE started from the fundamental fact that an individual in a group is subjected through its influence to what is often a profound alteration in his mental activity His emotions become extraordinarily intensified while his intellectual ability becomes markedly reduced both processes being evidently in the direction of an approximation to the other individuals in the group and this result can only be reached by the removal of those inhibitions upon his instincts which are peculiar to each individual and by his resigning those expressions of his inclinations which are especially his own We have heard that these often unwelcome consequences are to some extent at least prevented by a higher organization of the group but this does not contradict the fundamental fact of group psychology—the two theses as to the intensification of the emotions and the inhibition of the intellect in primitive groups Our interest is now directed to discovering the psychological explanation of this mental change which is experienced by the individual in a group

It is clear that rational factors (such as the intimidation of the individual which has already been mentioned that is the action of his instinct of self preservation) do not cover the observable phenomena Beyond this what we are offered as an explanation by authorities upon sociology and group psychology is always the same even though it is given various names and that is—the m gic word *suggestion* Tarde calls it imitation but we cannot help agreeing with a writer who protests that imitation comes under the concept of su gestion and is in fact one of its results Le Bon traces back all the puzzling features of social phenomena to two factors the mutual su estion of individuals and the prestige of leaders But prestige again is only recognizable by its capacity for evokin suggestion McDougall for a moment gives us an impression that his principle of primitive induction of emotion might enable us to do without the assumption of suggestion But on further consideration we are forced to perceive that this principle says no more than the familiar assertions about imitation or contagion except for a decided stress upon the emotional factor There is no doubt that something exists in us which when we become aware of signs of an emotion in someone else tends to make us fall into the same emotion but how often do we not successfully oppose it resist the emotion and react in quite an opposite way? Why therefore do we invariably give way to this contagion when we are in a group? Once more we should have to say that what compels us to obey this tendency is imitation and what induces the emotion in us is the group s suggestive influence Moreover quite apart from this McDougall does not enable us to evade suggestion we hear from him as well as from other writers that groups are distinguished by their special suggestibility

We shall therefore be prepared for the statement that suggestion (or more correctly suggestibility) is actually an irreducible primitive phenomenon a fundamental fact in the mental life of man Such too was the opinion of Bernheim of whose astonishing arts I was a witness in the year 1889 But I can remember even then feeling a muffled hostility to this tyranny of suggestion When a patient who showed himself unamenable was met with the shout What are you doing? *Vous vous contresuggestionnez!* I said to myself that this was an evident injustice and an act of violence For the man certainly had a right to counter su gestions if they were trying to subdue him with suggestions Later on my resistance took the direction of protesting against the view that suggestion which explained everything was itself to be preserved from explanation Thinking of it I repeated the old conundrum

I st ct of the Herd Pe c a d W Fisher U w 1916

ashamed of ex the Greek word *Eros* which is to soften the affront is in the end nothing more than a translation of our German word *Liebe* and finally he who knows how to wait need make no concessions

We will try our fortune then with the sup po ition that love relationships (or to use a more neutral expression emotional ties) also constitute the essence of the group mind Let us remember that the authorities make no men tion of any such relations What would corre spond to them is evidently concealed behind the shelter the screen of suggestion Our hy pothesis finds support in the first instance from two passing thoughts First that a group is clearly held together by a power of some kind and to what power could this feat be better as cribed than to Eros who holds together every thing in the world? Secondly that if an indi vidual gives up his distinctiveness in a group and lets its other members influence him by suggestion it gives one the impression that he does it because he feels the need of being in harmony with them rather than in opposition to them—so that perhaps after all he does it *ihnen u Liebe*

V TWO ARTIFICIAL GROUPS THE CHURCH AND THE ARMY

WE may recall from what we know of the morphology of groups that it is possible to distinguish very different kinds of groups and opposing lines in their development There are very fleeting groups and extremely lasting ones homogeneous ones made up of the same sorts of individuals and unhomogeneous ones nat ural groups and artificial ones requiring an external force to keep them together primi tive groups and highly organized ones with a definite structure But for reasons which have yet to be explained we should like to lay par ticular stress upon a distinction to which the authorities have rather given too little atten ion I refer to that between leaderless groups and those with leaders And in complete oppo sition to the usual practice we shall not choose a relatively simple group formation as our point of departure but shall begin with highly organized lasting and artificial groups The most interesting example of such structures are churches—communities of believers—and ar mies

A church and an army are artificial groups that is a certain external force is employed to prevent them from disintegrating and to check alterations in their structure As a rule a per son is not consulted or is given no choice as to whether he wants to enter such a group any attempt at leaving it is usually met with perse cution or with severe punishment or has qui e definite conditions attached to it It is quite o side our present interest to enquire why the e associations need such pecial safeguards We are only attracted by one circumstance namely that certain facts which are far more con cealed in other cases can be ob erved very clearly in those highly organized groups which are protected from dissolution in the manner that has been mentioned

In a church (and we may with advanta e take the Catholic Church as a type) as well as in an army however different the two may be in other respects the same illusion hold good of there being a head—in the Catholic Church Christ in an army its commander in-chief—who loves all the individuals in the group with an equal love Everything depend upon this illusion if it were to be dropped then both Church and army would dissolve so far as the external force permitted them to This equal love was expres ly enunciated by Christ Inas much as ye have done it unto one of the lea t of these my brethren ye have done it unto me He stands to the individual members of the group of believers in the relation of a kind elder brother he is their father surro ate All the demands that are made upon the individual are derived from this love of Christ s A demo cratic character runs through the Church for the very reason that before Christ everyone is equal and that everyone has an equal share in his love It is not without a deep reason that the similarity between the Christian commun ty and a family is invoked and that believers call themselves *brothers in Christ* that is brothers through the love which Christ has for them There is no doubt that the tie which unites each individual with Christ is also the cau e of the tie which unites them with one another The like holds good of an army The comman der in chief is a father who loves all his sold ers equally and for that reason they are comrad s among themselves The army differs structural ly from the Church in being built up of a series of such groups Every captain is as it were the commander in chief and the father of his company and so is every non-commissioned officer of his section It is true that a similar

A ld m m g f th sak Lit rally f lo e of them. —TR.

hierarchy has been constructed in the Church, but it does not play the same part in it economically, for more knowledge and care about individuals may be attributed to Christ than to a human commander-in-chief.

It is to be noticed that in these two artificial groups each individual is bound by libidinal ties on the one hand to the leader (Christ, the commander-in-chief) and on the other hand to the other members of the group. How these two ties are related to each other, whether they are of the same kind and the same value, and how they are to be described psychologically—these questions must be reserved for subsequent enquiry. But we shall venture even now upon a mild reproach against the authorities for not having sufficiently appreciated the importance of the leader in the psychology of the group, whereas our own choice of a first object for investigation has brought us into a more favourable position. It would appear as though we were on the right road towards an explanation of the principal phenomenon of group psychology—the individual's lack of freedom in a group. If each individual is bound in two directions by such an intense emotional tie, we shall find no difficulty in attributing to that circumstance the alteration and limitation which have been observed in his personality.

A hint to the same effect, that the essence of a group lies in the libidinal ties existing in it, is also to be found in the phenomenon of panic, which is best studied in military groups. A panic arises if a group of that kind becomes disintegrated. Its characteristics are that none of the orders given by superiors are any longer listened to, and that each individual is only solicitous on his own account, and without any consideration for the rest. The mutual ties have ceased to exist, and a gigantic and senseless dread (*Angst*) is set free.

... (the example of military panic) as a typical instance of that intensification of emotion by contagion ("primary induction") upon which he lays so much emphasis. But, nevertheless, this rational method of explanation is here quite inadequate. The very question that needs explanation is why the dread has become so gigantic. The greatness of the danger cannot be responsible, for the same army which now falls a victim to panic may previously have faced equally great or greater danger with complete success; it is of the very essence of panic that it bears no relation to the danger that threatens, and often breaks out upon the most trivial occasions. If an individual in panic dread begins to be solicitous only on his own account, he bears witness in so doing to the fact that the emotional ties, which have hitherto made the danger seem small to him, have ceased to exist. Now that he is by himself in facing the danger he may surely think it greater. The fact is, therefore, that panic dread presupposes a relaxation in the libidinal structure of the group and reacts to it in a justifiable manner, and the contrary view—that the libidinal ties of the group are destroyed owing to dread in the face of the danger—can be refuted.

The contention that dread in a group is increased to enormous proportions by means of induction (contagion) is not in the least contradicted by these remarks. McDougall's view meets the case entirely when the danger is a really great one and when the group has no strong emotional ties—conditions which are fulfilled, for instance, when a fire breaks out in a theatre or a place of amusement. But the really instructive case and the one ... be ... u... intc... ere. ... a degree that is usual and has

An objection will justly be raised against this conception of the libidinal structure of an army on the ground that no place has been found ... areas ... which ... gether ... ed ... the ex... ... g ... us, like Caesar, Wallenstein, or Napoleon, show that such ideas are not indispensable ... the existence of an army. We shall presently touch upon the possibility of a leading idea being substituted for a leader and upon the relations between the two. The neglect of this libidinal factor in an army, even when it is not the only factor operative, seems to be not merely a theoretical omission but also a practical danger. Prussian militarism, which was just as unpsychological as German science, may have had to suffer the consequences of this in the Great War. We know that the war neuroses which ravaged the German army have been recognized as being a protest of the individual against the part he was expected to play in the army; and according to the communication of E. Simmel (*Kriegsneurosen und Psychisches Trauma*, Munich, 1918), the hard treatment of the men by their superiors may be considered foremost among the motive forces ... ... was broken in the hands of the German leaders.

ashamed of sex the Greek word *Eros* which is to soften the affront is in the end nothing more than a translation of our German word *Liebe* and finally he who knows how to wait need make no concessions

We will try our fortune then with the supposition that love relationships (or to use a more neutral expression emotional ties) also constitute the essence of the group mind Let us remember that the authorities make no mention of any such relations What would correspond to them is evidently concealed behind the shelter the screen of suggestion Our hypothesis finds support in the first instance from two passing thoughts First that a group is clearly held together by a power of some kind and to what power could this feat be better ascribed than to Eros who holds to ether everything in the world? Secondly that if an individual gives up his distinctiveness in a group and lets its other members influence him by suggestion it gives one the impression that he does it because he feels the need of being in harmony with them rather than in opposition to them—so that perhaps after all he does it *ihnen u Liebe*

V TWO ARTIFICIAL GROUPS THE CHURCH AND THE ARMY

WE may recall from what we know of the morphology of groups that it is possible to distinguish very different kinds of groups and opposing lines in their development There are very fleeting groups and extremely lasting ones homogeneous ones made up of the same sorts of individuals and unhomogeneous ones natural groups and artificial ones requiring an external force to keep them together primitive groups and highly organized ones with a definite structure But for reasons which have yet to be explained we should like to lay particular stress upon a distinction to which the authorities have rather given too little attention I refer to that between leaderless groups and those with leaders And in complete opposition to the usual practice we shall not choose a relatively simple group formation as our point of departure but shall begin with highly organized lasting and artificial groups The most interesting example of such structures are churches—communities of believers—and armies

A church and an army are artificial groups that is a certain external force is employed to prevent them from disintegrating and to check alterations in their structure As a rule a person is not consulted or is given no choice as to whether he wants to enter such a group any attempt at leaving it is usually met with per e cution or with severe punishment or has quite definite conditions attached to it It is quite outside our present interest to enquire why these associations need such special safeguards We are only attracted by one circumstance namely that certain facts which are far more concealed in other cases can be observed very clearly in those highly organized groups which are protected from dissolution in the manner that has been mentioned

In a church (and we may with advanta e take the Catholic Church as a type) as well as in an army however different the two may be in other respects the same illusion holds good of there being a head—in the Catholic Church Christ in an army its commander in chief—who loves all the individuals in the group with an equal love Everything depends upon this illusion if it were to be dropped then both Church and army would dissolve so far as the external force permitted them to This equal love was expres ly enunciated by Christ Inasmuch as ye have done it unto one of the lea t of these my brethren ye have done it unto me He stands to the individual members of the group of believers in the relation of a kind elder brother he is their father surrogate All the demands that are made upon the individual are derived from this love of Christ s A democratic character runs through the Church for the very reason that before Christ everyone is equal and that everyone has an equal share in his love It is not without a deep reason that the similarity between the Christian community and a family is invoked and that believers call themselves *brothers in Christ* that is brothers through the love which Christ has for them There is no doubt that the tie which unites each individual with Christ is also the cau e of the tie which unites them with one another The like holds good of an army The commander in chief is a father who love all his sold ers equally and for that reason they are comrad s among themselves The army differs structurally from the Church in being built up of a series of such groups Every captain is as it were the commander in chief and the father of his company and so is every non-commissioned officer of his section It is true that a similar

often been previously faced It is not to be expected that the usage of the word *panic* should be clearly and unambiguously deter mined Sometimes it is used to describe any collective dread sometimes even dread in an individual when it exceeds all bound and often the name seems to be reserved for cases in which the outbreak of dread is not warranted by the occasion If we take the word *panic* in the sense of collective dread we can establish a far reaching analogy Dread in an individual is provoked either by the greatness of a danger or by the cessation of emotional ties (libidinal cathexes [*Libidobeset ungen*]) the latter is the case of neurotic dread In just the same way panic arises either owing to an increase of the common danger or owing to the disappear ance of the emotional ties which hold the group together and the latter case is analogous to that of neurotic dread

Anyone who like McDougall *(op cit)* de scribes a panic as one of the plainest functions of the group mind arrives at the paradoxical position that this group mind does away with itself in one of its most striking manifestations It is impossible to doubt that panic means the disintegration of a group it involves the cessa tion of all the feelings of consideration which the members of the group otherwise show one another

The typical occasion of the outbreak of a panic is very much as it is represented in Nestroy s parody of Hebbel s play about Judith and Holofernes A soldier cries out The gen eral has lost his head! and thereupon all the Assyrians take to flight The loss of the leader in some sense or other the birth of mi givin s about him brings on the outbreak of panic though the danger remains the same the mu tual ties between the members of the group dis appear as a rule at the same time as the tie with their leader The group vani hes in dust like a Bologna flask when its top is broken off

The dissolution of a religious group is not so easy to observe A short time ago there came into my hands an English novel of Catholic origin recommended by the Bishop of London with the title *W hen It W as Da k* It gave a clever and as it seems to me a convincing pic ture of such a possibility and its consequences The novel which is supposed to relate to the present day tells how a conspiracy of enemies of the figure of Christ and of the Christian faith succeed in arranging for a sepulchre to be discovered in Jerusalem In this sepulchre is an inscription in which Jo eph of Arimathaea con fesses that for reasons of piety he secretly re moved the body of Christ from its grave on the third day after its entombment and buried it in this spot The resurrection of Christ and his divine nature are by this means disposed of and the result of this archaeolo ical discovery is a convulsion in European civilization and an extraordinary increase in all crimes and acts of violence which only ceases when the forgers plot has been revealed

The phenomenon which accompanies the dis solution that is here supposed to overtake a religious group is not dread for which the occasion is wanting Instead of it ruthless and hostile impulses towards other people make their appearance which owing to the equal love of Christ they had previously been unable to do But even during the kingdom of Christ those people who do not belong to the com munity of believers who do not love him and whom he does not love stand outside this tie Therefore a religion even if it calls itself the religion of love must be hard and unloving to those who do not belong to it Fundamentally indeed every religion is in this same way a reli ion of love for all those whom it embraces while cruelty and intolerance towards those who do not belong to it are natural to every re ligion However difficult we may find it per sonally we ou ht not to reproach believers too severely on this account people who are unbe lieving or indifferent are so much better off psychologically in this respect If today that intolerance no lon er shows itself so violent and cruel as in former centuries we can scarcely conclude that there has been a softening in human manners The cause is rather to be found in the undeniable weakening of rel gious feelings and the libidinal ties which depend upon them If another group tie takes the place of the religious one—and the socialistic tie seems to be succeeding in doing so—then there will be the same intolerance towards outsiders as in the age of the Wars of Religion and if differences between scientific opinions could ever attain a similar significance for groups the ame result would again be repeated with this new motivation

though the occurrence of any d his own a c alte know why such sensitiveness should have been directed to just these details of differentiation but it that in of a re source known and to which one is tempted to ascribe an elementary character

But the whole of this intolerance vanishes temporarily or permanently as the result of the formation of a group and in a group So long as a group formation persists or so far as it extends individuals behave as thou h they were uniform tolerate other people s peculiarities put them elves on an equal level with them and have no feeling of aversion towards them Such a limitation of narcissism can according to our theoretical views only be produced by one factor a libidinal tie with other people Love for oneself knows only one barrier—love for others love for objects The question will at once be raised whether community of interest in itself without any addition of libido must not necessarily lead to the toleration of other people and to considerateness for them This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way since this tolerance does not persist longer than the immediate advantage gained from the other people s collaboration But the practical importance of the discussion is less than might be supposed for experience has shown that in cases of collaboration libidinal larly prolo to a p same has b psycho analytic research in the course of the development of the individual libido The libido props itself upon the satisfaction of the great vital needs and chooses as its first objects the people who have a share in that process And in the development of mankind as a whole just as in individuals love alone acts as the civilizing factor in the sense that it br ngs a change from egoism to altruism And this is true both of the sexual love for women with all the obligations wh ch it involves of sparing what women are fond of and al o of the desexualised sublimated homosexual love for other men which prings from work in common

If therefore in groups narcissistic elf love is subject to limitations which do not operate outside them that is co ent evidence that the essence of a group formation consists in a new kind of libidinal ties among the members of the group

But our interest now leads us on to the pressing question as to what may be the nature of the e ties which exist in groups In the psychoanalytic study of neuroses we have hitherto been occupied almost exclusively with ties that unite with their objects tho e love in tincts which still pursue directly sexual aims In groups there can evidently be no question of sexual aims of that kind We are concerned here with love instincts which have been diverted from their original aims thou h they do not operate with less energy on that account Now we have already ob erved within the range of the usual exual object cathexis *(Objektbeset ung)* phenomena which represent a diversion of the instinct from its sexual aim We have de cribed them as degrees of being in love and have recognized that they involve a certain encroachment upon the ego We shall now turn our attention more closely to these phenomena of being in love in the firm expectation of finding in them conditions which can be transferred to the ties that exist in groups But we should also like to know whether this kind of object-cathexis as we know it in sexual life represents the only manner of emotional tie with other people or whether we must take other mechanisms of the sort into account As a matter of fact we learn from psycho analysis that there do exist other mechanisms for emotional tie the so called *identificat ons* insufficiently known processes and hard to describe the inve tiga tion of which will for some time keep us away from the subject of group psychology

VII IDENTIFICATION

IDENTIFICATION is known to psycho analysis as the earliest expression of an emotional tie with another person It plays a part in the early history of the Oedipus complex A little boy will exhibit a special interest in his father he would like to grow like him and be like him and take his place everywhere We may say simply that he takes his father as his ideal This behaviour has nothing to do with a passive or feminine attitude towards his father (and towards males

-criticism and bitter elf repro hes Analy ses have hown t at this disparagement and these reproaches apply at bottom to the object and represent the ego s revenge upon it. Th shadow of the object has fallen upon the ego as I have d elsewhere The introj ction of t bject is her unmistakably clear

But these melancholias also how us ome t ng else which may be of importance for our later discus ons They how us the ego divided fallen into two pieces one of which rages against the second. This second piece is the one which has been altered by introjecti n and which contains the lost object. But the p ece which behaves so cruelly not unknown to us either It comprises the conscience a critical faculty (*Instanz*) within the ego which even in normal times takes up a critical attitude towards the ego though never so relentles l and so unjustifiably On previous occasions we have been driven to the hypothesis that som uch faculty develops in our ego wh h may cut itself off from the rest f the ego and come into conflict with it. W have called it the *ego ideal* and by way of functions w have a cribed to it self-observation th moral conscience the censorship f dream and the chief influence in repression. W ha e aid that it is the heir t the original narci ism in which the childish ego found its self-sufficiency t gradually gathers up from the i uences of the environment the demands wh h that envi onment makes upon the ego and which the ego cannot always rise to so that man, w en he cannot be satis ed with his e lf may nevertheless be able t find sati f ction in the ego ideal which has been differentiated out of the ego In d lusions of observation as we have further shown, the disintegration f this faculty has become patent, d has thus revealed its origin in the influen of superi powers d bove all f parents. But we have not forgotten t d that the amount of distance between this ego ideal and the real ego is very variabl from one indi dual to another and that with many people this d erentiation within the ego does t go f rther than with children.

But be ore w can employ this material for understanding the libidinal organization f groups, we must take into ccount some other examples f the mutual rela ons between the bject and the eg

VIII BEING IN LOVE AND HYPNOSIS

EVEN in its caprices the usage of language re mains true to some kind of reality Thus i gives the name of *love* to a great ma y kinds of emotional relation h p which we too group togeth r theoretically as love but then again it feels a doubt whether this love is real true actual love and o hints at a whole scale of pos bi ties within range of th phenomena of love W all ha e no difficulty in making the same discovery emp rically

In one c s of cases, bein in love is nothi more than object-cathexis on the part of the w h ew t directl sexual

moreover

is what

is called *common sensual lo* as we know the libidinal ation rarely remains so

calculate with ertain

w h pursued by the erotic l f f man. In his first phase which has usually com to an end by the time he is fi e years ld, child has f und th firs object f his love in one or o her of his paren and all of his sexual instincts with their demand for sa isfaction ha e been united upon this bject Th rep es on which then sets in compels him to renounce the great numbe of these infantile sexual aim

Mourning and Melancholia, *Collected P per* IV —Tr.

"On Narcissism an Introduction [p 399 above] Mourning and Melancholia.

"On N rcissism an I oduction,

W re very well ware that we have not exhausted the nature f identification with these examples taken from pathology and that we have consequently l f part f the riddle f group formations untouched. A far more fundamental and comprehensive psychological analysis would ha to intervene this point. A path leads from identification by way of imitation to empathy that is to be comprehended f the mechanism by means f which we re enabled take up any ode al toward other mental li M reove there is still much be expl ined in the manifesta ions f ex ting identifica ions. These resul mong other things in person limiting his aggressiveness towards those with om he has iden ed

love which arouses her jealousy and that she reacts to it with a fit of hysterics then some of her friends who know about it will contract the fit as we say by means of mental infection The mechanism is that of identification based upon the possibility or desire of putting oneself in the same situation The other girls would like to have a secret love affair too and under the influence of a sense of guilt they also accept the pain involved in it It would be wrong to suppo e that they take on the symptom out of sympathy On the contrary the sympathy only ari es out of the identification and this is proved by the fact that infection or imitation of this kind takes place in circum tances where even less pre existing sympathy is to be as sumed than usually exists between friends in a girls school One ego has perceived a signifi cant analogy with another upon one point—in our example upon a similar readiness for emotion an identification is thereupon con structed on this point and under the influence of the pathogenic situation is displaced on to the symptom which the one ego has produced The identification by means of the symptom has thus become the mark of a point of coin cidence between the two egos which has to be kept repressed

What we have learned from these three sources may be summarized as follows First identification is the original form of emotional tie with an object secondly in a regressive way it becomes a substitute for a libidinal ob ject tie as it were by means of the introjection of the object into the e o and thirdly it may arise with every new perception of a common quality shared with some other person who is not an object of the sexual instinct The more important this common quality is the more successful may this partial identification be come and it may thus represent the beginning of a new tie

We already be˜in to divine that the mutual tie between members of a group is in the nature of an identification of this kind based upon an important emotional common quality and we may suspect that this common quality lies in the nature of the tie with the leader Another suspicion may tell us that we are far from having exhausted the problem of identification and that we are faced by the process which psycholo˜y calls *empatl y* (*Einfuhlung*) and wh h pl h

cation and shall leave on one side its signifi cance for our intellectual life

Psycho analytic research which has already occasionally attacked the more difficult prob lems of the psychoses has also been able to exhibit identification to us in some other cases which are not immediately comprehensible I shall treat two of these cases in detail as ma terial for our further consideration

The genesis of male homo exuality in a larg class of cases is as follows A young man has been unusually long and intensely fixated upon his mother in the sense of the Oedipus complex But at last after the end of his puberty the time comes for exchangin his mother for some other sexual object Things take a sudden turn the young man does not abandon his mother but identifies himself with her he transforms himself into her and now looks about for objects which can replace his ego for him and on which he can bestow such love and care as he has experienced from his mother This is a frequent process which can be confirmed as often as one likes and which is naturally quite independent of any hypothesis that may be made as to the organic drivin force and the motives of the sudden transformation A strik ing thing about this identification is its ample scale it remoulds the ego in one of its im portant features—in its sexual character—upon the model of what has hitherto been the object. In this process the object itself is renounced—whether entirely or in the ense of being pre served only in the unconscious is a question outside the present discussion Identification with an object that is renounced or lost as a substitute for it introjection of this object into the ego is indeed no longer a novelty to us A process of the kind may sometimes be directly ob erved in small children A short time ago an observation of this sort was published in the *Internationale Zeitschrift fur Psychoanalyse* A child who was unhappy over the loss of a kitten declared straight out that now he him self was the kitten and accordingly crawled about on all fours would not eat at table etc

Another such instance of introjection of the object has been provided by the analysis of melanchol a an affection which counts amon the most remarkable of its exc ting causes the real or emotional loss of a loved object A l ad ing characteristic of these cases is a cruel elf depreciation of the ego combined with relentless

b M K cu d w I ter B l t g al m Z l t h l ft hen j D k Psycho aly (9) V L VI.

kind of account creates an 'llu on of c ntra distinctions that have no real exist nce Eco- nomically there is no que tion of impo 'erı h ment or enrichment t is even poss'ble to describe an extreme case of being in lo e as a sta e in which the ego has introjected th ob- ject m itself Another distinction is perhaps better calcula ed to meet the es ence of the matter In the case of dentification the object has been lost o given up it is then set up again inside the ego, a d the ego makes a par tial alteration in itself after the model of the lost object. In the other ca e the object i re tained, and there is a hyper-cathexis of t by the ego and at the ego s expen e But h re again difficulty presents itself Is it quite certain that identification presupposes that ob- ject-cathexis has been gi en up? Can there be identification w th the object retained And before we emba k upon a di cuss o f this de ca e question, the pe cept on may already be beginning to dawn on u that yet another al erna e embra es th real es enc of the matt r nam ly *wh ther th object is put n the pl e of the go or of the ego ideal*

From being in lo e to hypn s s is e dently only h rt tep. must be de cribed as being inhibited in their aim [ielgehemmte] The emotions which he feels henceforward towards these objects of his love are characterized as *tender* It is well known that the earlier *sensual* tendencies re main more or less strongly preserved in the unconscious so that in a certain sense the whole of the original current continues to exist

At puberty as we know there set in new and very strong tendencies with directly sexual aims In unfavourable cases they remain separate in the form of a sensual current from the tender emotional trends which persist We are then faced by a picture the two aspects of which certain movements in literature take such de light in idealizing A man of this kind will show a sentimental enthusiasm for women whom he deeply respects but who do not excite him to sexual activities and he will only be potent with other women whom he does not love but thinks little of or even despises More often however the adolescent succeeds in bringing about a certain degree of synthesis between the unsensual heavenly love and the sensual earthly love and his relation to his sexual ob ject is characterized by the interaction of un inhibited instincts and of instincts inhibited in their aim The depth to which anyone is in love as contrasted with his purely sensual desire may be measured by the size of the share taken by the inhibited instincts of tenderness

In connection with this question of being in love we have always been struck with the phe nomenon of sexual over estimation—the fact that the loved object enjoys a certain amount of freedom from criticism and that all its char acteristics are valued more highly than those of people who are not loved or than its own were at a time when it itself was not loved If the sensual tendencies are somewhat more ef fectively repressed or set aside the illusion is produced that the object has come to be sen sually loved on account of its spiritual merits whereas on the contrary the e merits may really only have been lent to it by its sensual charm

The tendency which falsifies judgment in this respect is that of *ideali ation* But this makes it easier for us to find our way about We see that the object is being treated in the same way as our own ego so that when we are in love a considerable amount of narcissistic li bido overflows on to the object It is even ob vious in many forms of love choice that the object serves as a substitute for some unat tained ego ideal of our own We love it on account of the perfections which we have striven to reach for our own e o and which we should now like to procure in this roundabout way as a means of satisfyin our narcissism

If the sexual over estimation and the being in love increase even further then the interpre tation of the picture becomes still more un mistakable The tendencies whose trend is to wards directly sexual satisfaction may now be pushed back entirely as regularly happens for instance with the young man s sentimental passion the e o becomes more and more un assuming and modest and the object more and more sublime and precious until at last it gets possession of the entire self love of the ego whose self sacrifice thus follows as a natural consequence The object has so to speak con sumed the ego Traits of humility of the limi tation of narcissism and of self injury occur in every case of being in love in the extreme case they are only intensified and as a result of the withdrawal of the sensual claims they remain in solitary supremacy

This happens especially easily with love that is unhappy and cannot be satisfied for in spite of everythin each sexual satisfaction always involves a reduction in sexual over estimation Contemporaneously with this *devotion* of the ego to the object which is no longer to be dis tinguished from a ublimated devotion to an abstract idea the functions allotted to the ego ideal entirely cease to operate The criticism exercised by that faculty is silent everything that the object does and asks for is ri ht and blameless Conscience has no application to anything that is done for the sake of the ob ject in the blindness of love remorseles ness is carried to the pitch of crime The whole situ ation can be completely summarized in a fo mula *The object has taken the place of t ego ideal*

It is now easy to define the distinction be tween identification and such extreme develop ments of being in love as may be described a *fascination* or *infatuation* In the former ca e the ego has enriched itself with the properties of the object it has *introjected* the object into itself as Ferenczi expre ses it In the second case it is impoverished it has surrendered itself to the object it has substituted the object for its most important con tituent Closer consid eration soon makes it plain however that this

Thus the group appears to us as a revival of the primal horde Just as primitive man virtually survives in every individual, so the primal horde may arise once more out of any random crowd in so far as men are habitually under the sway of group formation we recognize in it the survival of the primal horde We must conclude that the psychology of the group is the oldest human psychology what we have isolated as individual psychology by neglecting all traces of the group has only since come

vent re upon an attempt at specifying the p of departure of this development

Further reflection will show us in what respect this statement requires correction Individual psychology must on the contrary be just as old as group psychology for from the first there were two kinds of psychologies that of the individual members of the group and that of the father chief or leader The members of the group were subject to ties just as we see them today but the father of the primal horde was free His intellectual acts were strong and independent even in isolation and his will needed no reinforcement from others. Consistency leads us to assume that his ego had few libidinal ties he loved no one but himself or other people only in so far as they served his needs. To objects his ego gave away no more than was barely necessary

He at the very beginning of the history of mankind was the *Superman* whom Nietzsche

no o Le h may be of a masterly nature absolutely narcissistic but self-confident and independent. We know that love puts a check upon narcissism and it would be possible to show how by operating in this way it became a factor of civilization.

The primal father of the horde was not yet immortal, he later became by deification. If he died, he had to be replaced his place was probably taken by a youngest son who had up to then been a member of the group like any other There must therefore be a possibility of transforming group psychology into individual psychology a condition must be discovered under which such a transformation is easily accomplished, just as it is possible for bees in case of necessity to turn a larva into a queen instead of into a worker One can imagine only one possibility the primal father had prevented his sons from satisfying their directly sexual tendencies he forced them into abstinence and consequently into the emotional ties with him and with one another which could arise out of those of their tendencies that were inhibited in their sexual aim He forced them so to speak into group psychology His sexual jealousy and intolerance became in the last resort the causes of group psychology

Whoever became his successor was also given the possibility of sexual satisfaction and was by that means offered a way out of the conditions of group psychology The fixation of the

his sexual tendencies that were inhibited in their aim and allowed his narcissism always to rise to its full height. We shall return in a postscript to this connection between love and character formation.

We may further emphasize as being specially instructive the relation that holds between the contrivance by means of which an artificial

father and feared him equally This same requesting upon which all social duties are built up is already presupposed by the next form of human society the totemistic clan The indestructible strength of the family as a natural

It may perhaps also be assumed that the sons when they were driven out and separated from their father advanced from identification to homosexual object love and in this way were freed to kill their father

be glad to have a share of his flowing locks Originally rivals they have succeeded in identifying themselves with one another by means of a similar love for the same object When as is usual a situation in the field of the instincts is capable of various outcomes we need not be surprised if the actual outcome is one which involves the possibility of a certain amount of satisfaction while another even though in itself more obvious is passed over because the circumstances of life prevent its attaining this aim

What appears later on in society in the shape of *Gemeingeist esprit de corps* group spirit etc does not belie its derivation from what was originally envy No one must want to put himself forward every one must be the same and have the same Social justice means that we deny ourselves many things so that others may have to do without them as well or what is the same thing may not be able to ask for them This demand for equality is the root of social conscience and the sense of duty It reveals itself unexpectedly in the syphilitic s dread of infecting other people which psycho analysis has taught us to understand The dread exhibited by these poor wretches corre ponds to their violent strug les against the unconscious wish to spread their infection on to other people for why should they alone be infected and cut off from so much? Why not other people as well? And the same germ is to be found in the pretty anecdote of the judg ment of Solomon If one woman s child is dead the other shall not have a live one either The bereaved woman is recognized by this wish

Thus social feeling is based upon the reversal of what was first a hostile feeling into a posi tively toned tie of the nature of an identifica tion So far as we have hitherto been able to follow the course of events this reversal ap pears to be effected under the influence of a common tender tie with a person outside the group We do not ourselves regard our analysis of identification as exhaustive but it is enough for our present purpose that we should revert to this one feature—its demand that equaliza tion shall be consistently carried through We have already heard in the discussion of the two artificial groups church and army that their preliminary condition is that all their members should be loved in the same way by one person the leader Do not let us forget however that the demand for equality in a group applies only to its members and not to the leader All the members must be equal to one another but they all want to be ruled by one person Many equals who can identify themselves with one another and a single person superior to them all—that is the situation that we find realized in groups which are capable of subsisting Let us venture then to correct Trotter s pronouncement that man is a herd animal and assert that he is rather a horde animal an individual creature in a horde led by a chief

X THE GROUP AND THE PRIMAL HORDE

IN 1912 I took up a conjecture of Darwin s t the effect that the primitive form of human so ciety was that of a horde ruled over despoti cally by a powerful male I attempted to show that the fortunes of this horde have left inde structible traces upon the history of human descent and especially that the development of totemism which comprises in it elf the be ginnings of religion morality and social or ganization is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of broth ers To be sure this is only a hypothe is like so many others with which archaeolo ists en deavour to lighten the darkness of prehi toric times—a Just So Story as it was amu ingly called by a not unkind critic (Kroe er) but I think it is creditable to such a hypothesis if it proves able to bring coherence and under standing into more and more new regions

Human groups exhibit once again the famil iar picture of an individual of superior strength among a troop of similar companions a picture which is also contained in our idea of the primal horde The psycholo y of such a group as we know it from the descriptions to which we have so often referred—the dwindlin of the conscious individual personality the focus sing of thou hts and feelings into a common direction the predominance of the emotions and of the unconscious mental life the tend ency to the immediate carrying out of inten tions as they emerge—all this corre pond to a state of regression to a primitive mental acti ity of just such a sort as we should be inclined to ascribe to the primal horde

masochistic attitude is possible, to whom one's will has to be surrendered—while to be alone with him, "to look him in the face," appears a hazardous enterprise. It is only in some such way as this that we can picture the relation of the individual member of the primal horde to the primal father. As we know from other reactions, individuals have preserved a variable degree of personal aptitude for reviving old situations of this kind. Some knowledge that in spite of everything, hypnosis is only a game, a deceptive renewal of these old impressions, may however remain behind and take care that there is a resistance against any too serious consequences of the suspension of the will in hypnosis.

The uncanny and coercive characteristics of group formations, which are shown in their suggestion phenomena, may therefore with justice be traced back to the fact of their origin from the primal horde. The leader of the group is still the dreaded primal father; the group still wishes to be governed by unrestricted force; it has an extreme passion for authority; in Le Bon's phrase, it has a thirst for obedience. The primal father is the group ideal, which governs the ego in the place of the ego ideal. Hypnosis has a good claim to being described as a group of two; there remains as a definition for suggestion a conviction which is not based upon perception and reasoning but upon an erotic tie.

XI. A Differentiating Grade in the Ego

If we survey the life of an individual man of today, bearing in mind the mutually complementary accounts of group psychology given by the authorities, we may lose the courage, in face of the complications that are revealed, to attempt a comprehensive exposition. Each individual is a component part of numerous groups, he is bound by ties of identification in many directions, and he has built up his ego ideal upon the most various models. Each individual, therefore, has a share in numerous group minds—those of his race, of his class, of his creed, of his nationality, etc.—and he can also raise himself above them to the extent of having a scrap of independence and originality. Such stable and lasting group formations, with their uniform and constant effects, are less striking to an observer than the rapidly formed and transient groups from which Le Bon has made his brilliant psychological character sketch of the group mind. And it is just in these noisy ephemeral groups, which are as it were superimposed upon the others, that we are met by the prodigy of the complete, even though only temporary, disappearance of exactly what we have recognized as individual acquirements.

We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add, by way of correction, that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier self-complacency. The selection of the leader is very much facilitated by this circumstance. He need only possess the typical qualities of the individuals concerned in a particularly clearly

would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by *suggestion*, that is to say, by means of identification.

We are aware that what we have been able to contribute towards the explanation of the libidinal structure of groups leads back to the distinction between the ego and the ego ideal and to the double kind of tie which this makes possible—identification and substitution of the object for the ego ideal. The assumption of this kind of differentiating grade *(Stufe)* in the ego as a first step in an analysis of the ego must gradually establish its justification in the most various regions of psychology. In my paper "On Narcissism: an Introduction" I have put together all the pathological material that could at the moment be used in support of this separation. But it may be expected that when we penetrate deeper into the psychology of the psychoses its significance will be discovered to be far greater. Let us reflect that the ego now

[1] It seems to me worth emphasizing the fact that

of the group from the primal horde It ought also to help us to understand what is still in comprehensible and mysterious in group formations—all that lies hidden behind the enigmatic words *hypnosis* and *suggestion* And I think it can succeed in this too Let us recall that hypnosis has somethin positively uncanny about it but the characteristic of uncanniness suggests something old and familiar that has undergone repression Let us consider how hypnosis is induced The hypnotist asserts that he is in possession of a mysterious power which robs the subject of his own will or which is the same thing the subject believes it of him This mysterious power (which is even now often described popularly as animal magnetism) must be the same that is looked upon by primitive people as the source of taboo the same that emanates from kings and chieftains and makes it dangerous to approach them (*mana*) The hypnotist then is supposed to be in possession of this power and how does he manifest it? By telling the subject to look him in the eyes his most typical method of hypnotizing is by his look But it is precisely the sight of the chieftain that is dangerous and unbearable for primitive people just as later that of the Godhead is for mortals Even Moses had to act as an intermediary between his people and Jehovah since the people could not support the sight of God and when he returned from the presence of God his face shone—some of the *mana* had been transferred on to him just as happens with the intermediary among primitive people

It is true that hypnosis can also be evoked in other ways for instance by fixing the eyes upon a bright object or listening to a monotonous sound This is misleading and has given occasion to inadequate physiological theories As a matter of fact these procedures merely serve to divert conscious attention and to hold it riveted The situation is the same as if the hypnotist had said to the subject Now concern yourself exclusively with my person the rest of the world is quite uninteresting It would of course be technically inexpedient for a hypnotist to make such a speech it would tear the subject away from his unconscious attitude and stimulate him to conscious opposition The hypnotist avoids directing the subject s conscious thoughts towards his own intentions and makes the person upon whom he is experimenting sink into an activity in which the world is bound to seem uninteresting to him but at the same time the subject is in reality unconsciously concentrating his whole attention upon the hypnotist and is getting into an attitude of *rapport* of transference on to him Thus the indirect methods of hypnotizing like many of the technical procedures used in making jokes have the effect of checking certain distributions of mental energy which would interfere with the course of events in the unconscious and they lead eventually to the same result as the direct methods of influence by means of staring or stroking

Ferenczi has made the true discovery that when a hypnotist gives the command to sleep which is often done at the beginnin of hypnosis he is putting himself in the place of the subject s parents He thinks that two sorts of hypnosis are to be distinguished one coaxing and soothing which he considers is modelled upon the mother and another threatening which is derived from the father Now the command to sleep in hypnosis means nothing more nor less than an order to withdraw all interest from the world and to concentrate it upon the person of the hypnotist And it is so understood by the subject for in this withdrawal of interest from the outer world lies the psycholo ical characteristic of sleep and the kinship between sleep and the state of hypnosis is based upon it

By the measures that he takes then the hypnotist awakens in the subject a portion of his archaic inheritance which had also made him compliant towards his parents and which had experienced an individual re animation in his relation to his father what is thus awakened is the idea of a paramount and dangerous personality towards whom only a passive

appears in the relation of an object to the ego ideal which has been developed out of it and that all the interplay between an outer object and the ego as a whole with which our study of the neuroses has made us acquainted may possibly be repeated upon this new scene of action inside the ego

In this place I shall only follow up one of the consequences which seem possible from this point of view thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning increases its instability and may become the starting point for its breakdown that is for the onset of a disease Thus by being born we have made the step from an absolutely self sufficient narcissism to the perception of a changing outer world and to the beginnings of the discovery of objects And with this is associated the fact that we cannot endure the new state of things for long that we periodically revert from it in our sleep to our former condition of absence of stimulation and avoidance of objects It is true however that in this we are following a hint from the outer world which by means of the periodical change of day and night temporarily withdraws the greater part of the stimuli that affect us The second example which is pathologically more important is not subject to any such qualification In the course of our development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it and we know that the stability of this new acquisition is exposed to constant shocks In dreams and in neuroses what is thus excluded knocks for admission at the gates guarded though they are by resistances and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure Wit and humour and to some extent the comic in general may be regarded in this light Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance but I hasten on to the application I have in view

It is quite conceivable that the separation of the ego ideal from the ego cannot be borne for long either and has to be temporarily undone In all renunciations and limitations imposed upon the ego a periodical infrin ement of the prohibition is the rule this indeed is shown by the institution of festivals which in orıgın are nothing more nor less than exces es provided by law and which owe their cheerful character to the release which they brin The Saturnalia of the Romans and our modern carnival agree in this essential feature with the festivals of primitive people which u ually end in debaucheries of every kind and the transgression of what are at other times the most sacred commandment But the ego ideal comprises the sum of all the limitations in which the ego has to acquiesce and for that reason the abrogation of the ideal would necessarily be a magnificent festival for the ego which mi ht then once a ain feel satisfied with itself

There is always a feeling of triumph when somethin in the ego coincides with the e o ideal And the sense of guilt (as well as the sense of inferiority) can also be understood as an expression of tension between the ego and the ego ideal

It is well known that there are people the general colour of whose mood oscillates periodically from an excessive depression through some kind of intermediate state to an exalted en e of well being These oscillations appear in very different degrees of amplitude from what is just noticeable to those extreme instances which in the shape of melancholia and mania make the most painful or disturbing inroads upon the life of the person concerned In typical cases of this cyclical depression outer exciting causes do not seem to play any decisive part as regards inner motives nothing more (or nothing different) is to be found in these patients than in all others It has consequently become the custom to consider these ca es as not being psychogenic We shall refer later on to those other exactly similar cases of cyclical depression which can nevertheless easily be traced back to mental traumata

Thus the foundation of these spontaneous oscillations of mood is unknown we are without insight into the mechanism of the displacement of a melancholia by a mania So we are free to suppose that these patients are people in whom our conjecture might find an actual application—their ego ideal might be tempo-

on the other hand we may fix the limits of sublimation at some more distant point Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited Since they are not capable of really complete satisfaction they are especially adapted to create permanent ties while those instincts which are directly sexual incur a loss of energy each time they are satisfied and must wait to be renewed by a fresh accumulation of sexual libido so that meanwhile the object may have been changed The inhibited instincts are capable of any degree of admixture with the uninhibited they can be transformed back into them just as they arose out of them It is well known how easily erotic wishes develop out of emotional relations of a friendly character based upon appreciation and admiration (compare Molière's *Embrasse moi pour l'amour du grec*) between a master and a pupil between a performer and a delighted listener and especially in the case of women In fact the growth of emotional ties of this kind with their purposeless beginnings provides a much frequented pathway to sexual object choice Pfister in his *Frommigkeit des Grafen von Zinzendorf* has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement On the other hand it is also very usual for directly sexual tendencies short lived in themselves to be transformed into a lasting and purely tender tie and the consolidation of a passionate love marriage rests to a large extent upon this process

We shall naturally not be surprised to hear that the sexual tendencies that are inhibited in their aims arise out of the directly sexual ones when inner or outer obstacles make the sexual aims unattainable The repression during the period of latency is an inner obstacle of this kind—or rather one which has become inner We have assumed that the father of the primal horde owing to his sexual intolerance compelled all his sons to be abstinent and thus forced them into ties that were inhibited in their aims while he reserved for himself freedom of sexual enjoyment and in this way remained without ties All the ties upon which a group depends are of the character of instincts that are inhibited in their aims But here we have approached the discussion of a new subject which deals with the relation between directly sexual instincts and the formation of groups

D The last two remarks will have prepared us for finding that directly sexual tendencies are unfavourable to the formation of groups. In the history of the development of the family there have also it is true been group relations of sexual love (group marriages) but the more important sexual love became for the ego and the more it developed the characteristics of being in love the more urgently it required to be limited to two people—*una cum uno*—as is prescribed by the nature of the genital aim. Polygamous inclinations had to be content to find satisfaction in a succession of changing objects

Two people coming together for the purpose of sexual satisfaction in so far as they seek for solitude are making a demonstration against the herd instinct the group feeling The more they are in love the more completely they suffice for each other The rejection of the group's influence is manifested in the shape of a sense of shame The extremely violent feelings of jealousy are summoned up in order to protect the sexual object choice from being encroached upon by a group tie It is only when the tender that is the personal factor of a love relation gives place entirely to the sensual one that it is possible for two people to have sexual intercourse in the presence of others or for there to be simultaneous sexual acts in a group as occurs at an orgy But at that point a regression has taken place to an early stage in sexual relations at which being in love as yet played no part and all sexual objects were judged to be of equal value somewhat in the sense of Bernard Shaw's malicious aphorism to the effect that being in love means greatly exaggerating the difference between one woman and another

There are abundant indications that being in love only made its appearance later on in the sexual relations between men and women so that the opposition between sexual love and group ties is also a late development Now it may seem as though this assumption were incompatible with our myth of the primal family For it was after all by their love for their mothers and sisters that the troop of brothers was as we have supposed driven to parricide and it is difficult to imagine this love as being anything but unbroken and primitive—that is as an intimate union of the tender and the sensual But further consideration resolves this objection into a confirmation One of the re-

actions to the parricide was after all the in stitution of totemistic exogam the prohib tion of a sexual relation with tho e women of the family who had been tende ly loved since childhood. In this way a wedge was d ven in be ween a man s tend r and sen ual feel ngs, one still firmly fixed in his erotic life today As a result of this exogamy the sensual needs of men had to be satisfied with trange and unloved women.

In th great artificial groups the church and the army there is no room fo woman as a sexual object The love relat on between men and women remains outside these organiza tions Even where groups re formed wh ch are composed of both men and women the distinc tion between the sexes plays o part There is scarcely any sense in asking whether the libido which keeps groups tog ther is of a homo-sexual o of heterosexual natu for it i not diff rentiated accordin to the se es and par ticularly shows a complete dis egard f r the aims of the genital organization of the lib do

E in person who has in othe respects becom abso bed in a group the directly sex ual tendencies pres rve little of his indiv dual activity If they become too strong they dis-integrate every group f rmat on Th Catholic Church had the best of motives fo rec mmend ing ts followers t remai unmarried a d f imposing elibacy upon it priest but f lling in love ha often dri en even priests t l ave the church In the sam way lo e f women breaks th ough th gr up ties f race f na tional separatio and f the social clas y tem, and t th prod important effects as a f cto in c vilization. It eems certain that homosexual lo e is fa mo e compatible with group ties even when it takes the shape f un inhib ted exual tenden es—a ema kabl f ct th explanatio f which might carry us far

Th psy h analytic in estigat on of th psy chon uroses has taught us that their ymptoms are t be traced back to di ectly exual tend-encies which re rep es ed but till emain acti e We can compl t this f rmula by dd in to t to tendencies inhib ted in their aims whose inhib tion has t been entirely su es ful or has made room f r a ret rn to th rep es ed sexual aim. It is in a dance with this that a urosis should mak ts v tim asocial and should remove him f m th ual group f rmations It may be said that a neu rosis has th sam disintegrati g effect upon a group as be g in lo e On the other hand it appears that where a powerful impetus has been g ven to group formation neuroses may di m nish and at all events temporarily disap-pear Ju tifiable attempts have also been made to turn this ntagon m between neuroses and group formation to therapeutic account Even those who do not regret the disappearance of rel gious illu ons from the civil zed world of toda w'll adm t that so lo g as they were in force they offered those who were bound by them the most powerful protection against the danger of neuro s Nor is it hard to discern in all the ties with myst co-rel gious or philoso hi co-religious sects and commun ties the man fes-tat on of d storted cures of all kinds of neu roses. All of th s is bound up with the contrast between directly sexual te dencies and those which are inh'b ted in the r a ms

If he is left to himself a n urot c is obl ged to replace by his own symptom formations the great group formations from which he is ex cluded He creates his own world of imagina tion for him elf his own rel gion his own

played by th directly sexual tendencies.

E I co clus on we will add a comparative estimate from the standpoint of the lib do theory of the tates with which we ha e been co cerned of being in love of hypnosis of group form tion and f the neurosis

Bei g love is based upon the imultane-ous presence of d rectly sexual tendencies and of sexual t ndenc es that are inhib ted in th r aim so that the object draws a part of the narcissistic ego-lib do to t elf It is a condition in whi h there is only room *for the ego* and the object.

Hypnosis resembles be ng in love in bein limit d to these two *persons* but *it is* based entirely upon xual t d c es that are in hib ted in their a ms and substitutes the obj ct for the ego deal

Th group multiplies this process t agrees with hypnos in the nature f th instincts which h ld t togeth and in th *replacement* of th ego ideal by the obj ct but to this it adds identificat on w th othe divid als which was perhaps originally made po ible by their ha in th same relat n t the bj ct

B th states hyp osis and gr up formatio an inh rited depos t from the phylogenesis

of the human libido—hypnosis in the form of a predisposition and the group besides this as a direct survival. The replacement of the directly sexual tendencies by those that are inhibited in their aims promotes in both states a separation between the ego and the ego ideal, a separation with which a beginning has already been made in the state of being in love.

The neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido—the twice repeated start made by the directly sexual function with an intervening period of latency.[1] To this extent it resembles hypnosis and group formation in having the character of a regression which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been completely successful, and it represents a *conflict* between those instincts which have been received into the ego after having passed through this development and those portions of the same instincts which, like other instinctive desires that have been completely repressed, strive from the repressed unconscious to attain direct satisfaction. The neurosis is extraordinarily rich in content, for it embraces all possible relations between the ego and the object—both those in which the object is retained and others in which it is abandoned or erected inside the ego itself—and also the conflicting relations between the ego and its ego ideal.

[1] Compare *Three Contributions to the Theory of Sex*.

The Ego and the Id

INTRODUCTION

IN my essay *Beyond the Pleasure Principle* published in 1920 I began the discussion of a train of thought my personal attitude towards which, as I mentioned there might be described as a sort of benevolent curiosity. In the following pages this train of thought is developed further. I have taken up those ideas and brought them into connection with various facts observed in psycho-analysis and have endeavoured to draw fresh conclusions from the combination. In the present work, however no further contributions are borrowed from biology and it consequently stands in a closer relation to psycho-analysis than does *Beyond the Pleasure Principle*. The thoughts contained in it are synthetic rather than speculative in character and their aim appears to be an ambitious one. I am aware however that they do not go beyond the baldest outlines and I am perfectly content to recognize their limitations in this respect.

At the same time the train of thought touches upon things not hitherto dealt with in the work psycho-analysis has done, and it can t a d con ern g itself with number of theories propounded by non analysts or by former analysts on their retreat from analysis. I am, as a rule always ready to acknowledge my debts to th wo kers but on this occasion I feel myself und no such obligation. If there are certain things to which hitherto psycho-analysis has not given adequate consideration that is t because it has overlooked their effects or wished t deny th s gnifican but because it pursues a particular path which had not yet carried it so f And moreover now that these things have at last been overtaken they appear t psycho-analysis in a diff ent shape from that in which they ppear to the other people.

I. CONSCIOUSNESS AND THE UNCONSCIOUS

IN this preliminary chapt r th re is nothing new t be said and it will ot be pos ible to a d epeating what has ften been sa d befo e

The division f mental life int what is conscious and what is unc nscious is th funda mental premise n which psycho-analysis is based and this division alon makes it possibl f r it to understand pathological mental processes which are as common as they are important and to co-ordinate them scientifically. Stated once more in a different way psycho analysis cannot accept the v ew that conscious ness is the essence of mental life but is obl ged to regard consciousness as o e property of mental life which may co-exist along with its other properties or may be absent

If I were to allow myself to suppose that every one interested in psychology would read this book, I should still be prepared to find that some of them would stop short even at this point and go no furthe for here we ha e the first shibboleth of psycho-analysis. To most people who have had a philosophical education the idea of anything mental which is not also conscious is so inconceivable that it seems to them absurd and refutable simply by logic. I believe this is only because they have never studied the mental phenomena of hypnosis and dreams which—quite apart from pathological manifestations—necessitate this conclus on. Th their psychology of consciousness is incapabl of sol ing the problems of dreams and hyp osis.

The term *conscious* is to start with a purely descriptive o resting on a pe ception of the most direct and certain character. Experience shows next, that a mental element (for in tance an idea) is not as a rule permanently conscious. On the co trary a ta e of con sciousness is characteristically very transitory an idea that is conscious now is o longer so a moment late although t can become so again under certain conditions that are easily brought about. What th dea was in the interval we d not know. We can say that t was *latent* and by this we mean that it was *capable of becom g cons ous* at any time. Or if w say that t was *uncons ious* we are giving an equally correct description. Thus *unconscious* in this sense of the word coincides with *latent and capable of becom g conscious*. The philosophers would no doubt object "No th term unconsci us does not apply here l ng as the dea was in a state of latency it wa not a mental element at all. To ontradict them at th point w uld lead to othing more profit able than a wa f words.

of the human libido—hypnosis in the form of a predisposition and the group besides this as a direct survival The replacement of the directly sexual tendencies by those that are inhibited in their aims promotes in both states a separation between the ego and the ego ideal a separation with which a beginning has already been made in the state of being in love

The neurosis stands outside this series It also is based upon a peculiarity in the development of the human libido—the twice repeated start made by the directly sexual function with an intervening period of latency To this extent it resembles hypnosis and group formation in having the character of a re ression which is absent from bein in love It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been completely successful and it represents a *conflict* between those instincts which have been received into the ego after having passed throu h this development and those portions of the same instincts which like other instinctive desires that have been completely repressed strive from the repressed unconscious to attain direct satisfaction The neurosis is extraordinarily rich in content for it embraces all possible relations between the ego and the object—both those in which the object is retained and others in which it is abandoned or erected inside the ego itself—and also the conflicting relations between the ego and its ego ideal

Compare *Th ee C nt but ns to the Tl eory of Sex*

In the further course of psycho-analytic work, however even these distinctions have proved to be inadequate and, for practical purposes insufficient. This has become clear in more ways than one but the decisive instance is as follows We have formulated the idea that in every individual there is a coherent organization of mental processes which we call his *ego* This ego includes consciousness and it controls the approaches to motility i.e. to the discharge of excitations into the external world it is this institution in the mind which regulates all its own constituent processes and which goes to sleep at night, though even then it continues to exercise a censorship upon dreams From this ego proceed the repressions too, by means of which an attempt is made to cut certain trends in the mind not merely from consciousness but also from their other forms of manifestation and activity In analysis these trends which have been shut out stand in opposition to the ego and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find that, during analysis, when we put certain tasks before the patient, he gets into difficulties his associations fail when they ought to be getting near the repressed. We then tell him that he is dominated by a resistance but he is quite unaware of the fact and, even if he guesses from his feelings of discomfort that a resistance is now at work in him, he does not know what it is or how to describe it. Since however there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious which behaves exactly like the repressed that is which produces powerful effects without itself being conscious and which requires special work before it can be made conscious From the point of view of analytic practice the consequence of this piece of observation is that we land in endless confusion and difficulty if we cling to our former way of expressing ourselves and try for instance to derive neuroses from a conflict between the conscious and the unconscious We shall have to substitute for this antithesis another taken from our understanding of the structural conditions of the mind, namely the antithesis between the organized ego and what is repressed and dissociated from it.

For our conception of the unconscious, however the consequences of our new observation are even more important Dynamic considerations caused us to make our first correction our knowledge of the structure of the mind leads to the second. We recognize that the *Ucs* does not coincide with what is repressed it is still true that all that is repressed is *Ucs* but not that the whole *Ucs* is repressed A part of the ego too—and Heaven knows how important a part—may be *Ucs* undoubtedly is *Ucs* And this *Ucs* belonging to the ego is not latent like the *Pcs* ... were ... could not be activated ... fronted by the necessity of postulating a third *Ucs* which is not repressed, we must admit that the property of being unconscious begins to lose significance for us. It becomes a quality which can have many implications so that we are unable to make it as we should have hoped the basis of far reaching and inevitable conclusions Nevertheless we must beware of ignoring this property for in the last resort the quality of being conscious or not is the single ray of light that penetrates the obscurity of depth-psychology

the psycho-analytic view F ... ignores ... facts first, that ... proceeding by difficult and requires very great ... concentrate enough attention on some thing unnoticed of this kind and secondly that ... has been observed the thing ... which was previously unnoticed ... no recognized by consciousness but often seems utterly alien and opposed ... and is promptly disavowed by ... Escaping from the unconscious is ... and take refuge in what is scarcely noticed or unnoticed is therefore after all, only an expression of the preconceived belief which regards the identity of mental and conscious as settled once and for all.

II THE EGO AND THE ID

PATHOLOGICAL research has centred our interest too exclusively on the repressed. We wish to know more about the ego now that we know that it, too can be unconscious in the proper sense of the word Hitherto the only guide we have had while pursuing our investigations has been the distinguishing mark of

See *Beyond the Pleasure Principle* p. 639 above.

But we have arrived at the term or concept of *unconscious* along another path by taking account of certain experiences in which mental dynamics play a part We have found that is we have been obliged to assume that very powerful mental processes o d

tnat ordinary ideas do (including effects that can in their turn be come conscious as ideas) without th m becoming pe bef point at psycho analytic theory steps in—with the assertion that such ideas cannot become conscious because a certain force is opposed to them that otherwise they could become con scious and that then one would see how little they differ from other elements which are admittedly mental The fact that in the tech nique of psycho analysis a means has been found by which the opposing force can be re moved and the ideas in question made conscious renders this theory irrefutable The state in which the ideas existed before being made con scious is called by us *repression* and we assert that the force which instituted the repression and maintains it is perceived as *resistance* dur ing the work of analysis

We obtain our concept of the unconscious therefore from the theory of repression The repressed serves us as a prototype of the un conscious We see however that we have two kinds of unconscious—that which is latent but capable of becoming conscious and that which is repressed and not capable of becoming con scious in the ordinary way This piece of insight into mental dynamics cannot fail to affect terminology and description That which is latent and only unconscious in the descriptive and not in the dynamic sense we call *p econ scious* the term *unconscious* we reserve for the dynamically unconscious repressed so that we now have three terms con

y a great deal closer to the *Cs* than is the *Ucs* and since we have called the *Ucs* mental we shall with even less hesita tion call the latent *Pcs* mental But why do we not choose instead of this to remain in agree ment with the philosophers and in a consistent way to distinguish the *Pcs* as well as the *Ucs* from what is conscious in the mind? The phi losophers would propose that both the *Pcs* and the *Ucs* should be described as two varieties or levels of *psychoid* and harmony would be established But endless difficulties in exposition would follow and the one important fact that the two kinds of *psychoid* as thus defined coincide in almost every other respect with what is admittedly mental would be forced into the background in the interests of a prej udice dating from a period in which they or the most important part of them were still unknown

We can now set to work comfortably with our three terms *Cs* *Pcs* and *Ucs* so long as we do not forget that while in the descriptive sense there are two kinds of unconscious in the dynamic sense *there is only one* For pur poses of exposition this distinction can in many cases be ignored but in others it is of course indispensable At the same time we have be come more or less accustomed to the e two meanings of the term *unconscious* and have managed pretty well with them As far as I can see it is impossible to avoid this ambiguity the distinction between conscious and uncon scious is in the last resort a question of a perception which must be either affirmed or denied and the act of perception itself tells us nothing of the reason why a thing is or is not perceived No one has a right to complain because the actual phenomenon expresses the underlying dynamic factors ambiguously

be given visual expression. Thinking in pictures is, therefore, only a very incomplete form of becoming conscious. In some way, too, it stands nearer to unconscious processes than does thinking in words, and it is unquestionably older than the latter both ontogenetically and phylogenetically.

To return to our argument: if, therefore, this is the way in which something that is in itself unconscious becomes preconscious, the question how we make something that is repressed (pre)conscious would be answered as follows. It is done by supplying through the work of analysis *Pcs* connecting links of the kind we have been discussing. Consciousness remains where it is, therefore; but, on the other hand, the *Ucs* does not rise up into the *Cs*.

Whereas the relation between external perceptions and the ego is quite perspicuous, that between internal perceptions and the ego requires special investigation. It gives rise once more to a doubt whether we are really justified in referring the whole of consciousness to the single superficial system *Pcpt-Cs*.

Internal perceptions yield sensations of processes arising in the most diverse and certainly also in the deepest strata of the mental apparatus. Very little is known about these sensations and feelings; the best examples we have of them are still those belonging to the pleasure-pain series. They are more fundamental, more elementary, than perceptions arising externally and they can come about even when consciousness is clouded. I have elsewhere expressed my views about their greater economic significance and its metapsychological foundation. These sensations are multilocular, like external perceptions; they may come from different places simultaneously and may thus have different or even opposite qualities.

Sensations of a pleasurable nature are not characterized by any inherently impelling quality, whereas "painful" ones possess this quality in a high degree. The latter impel towards change, towards discharge, and that is why we interpret "pain" as implying a heightening and pleasure a lowering of energic cathexis. Suppose we describe what becomes conscious in the shape of pleasure and "pain" as an undetermined quantitative and qualitative element in the mind; the question then is whether that element can become conscious where it actually is, or whether it must first be transmitted into the system *Pcpt*.

Clinical experience decides for the latter. It shows us that this undetermined element behaves like a repressed impulse. It can exert driving force without the ego noticing the compulsion. Not until there is resistance to the compulsion and blocking of the discharge-reaction, does the undetermined element instantly become conscious as "pain." In the same way that tensions arising from physical need can remain unconscious, so also can physical pain—a thing intermediate between external and internal perception, which acts like an internal perception even when its source is in the external world. It remains true again, therefore, that sensations and feelings only become conscious through reaching the system *Pcpt*; if the way forward is barred, they do not come into being as sensations, although the element corresponding to them is the same as if they did. We then come to speak, in a condensed and not entirely correct manner, of *unconscious feelings*, keeping up an analogy with unconscious ideas which is not altogether justifiable. Actually the difference is that, whereas with *Ucs* ideas connecting links must be formed before they can be brought into the *Cs*, with *feelings*, which are themselves transmitted directly, there is no necessity for this. In other words: the distinction between *Cs* and *Pcs* has no meaning where feelings are concerned; the *Pcs* here falls out of account, and feelings are either conscious or unconscious. Even when they are connected with verbal images, their becoming conscious is not due to that circumstance, but they become so directly.

The part played by verbal images now becomes perfectly clear. By their interposition, internal thought-processes are made into perceptions. It is like a demonstration of the theorem that all knowledge has its origin in external perception. It may sometimes happen that a hyper-cathexis of the process of thinking takes place, in which case thoughts are *perceived* in the literal sense of the word—as if they came from without—and are consequently held to be true.

After this clarifying of the relations between external and internal perception and the superficial system *Pcpt-Cs*, we can go on to work out our conception of the ego. It clearly starts out from its nucleus the system *Pcpt*, and begins by embracing the *Pcs*, which is adjacent to the memory-residues. But the ego, as we have learnt, is also unconscious.

Now I think we shall gain a great deal by following the suggestion of a writer who from personal motives vainly asserts that he has nothing to do with the rigours of pure science.

being conscious or unconscious and in the end we have come to see that this quality itself is ambiguous

Now all our knowledge is invariably bound up with consciousness Even knowledge of the *Ucs* can only be obtained by making it conscious But stop how is that possible? What does it mean when we say making it conscious ? How can that come about?

We already know the point from which we have to start in this connection We have said that consciousness is the *superficies* of the mental apparatus that is we have allocated it as a function to the system which is situated nearest to the external world Incidentally on this occasion the topographical terminology does not merely serve to describe the nature of the function but actually corresponds to the anatomical facts Our investigations too must take this surface organ of perception as a starting point

All perceptions which are received from without (sense perceptions) and from within—what we call sensations and feelings—are *Cs* from the start But how is it with those internal processes which we may—vaguely and inexactly—sum up under the name of *thought processes*? They represent displacements of mental energy which are effected somewhere in the interior of the apparatus as this energy proceeds on its way towards action Do they advance towards the superficies which then allows of the development of consciousness? Or does consciousness make its way towards them? This is clearly one of the difficulties that spring up when one begins to take the spatial or *topographical* conception of mental life seriously Both these possibilities are equally unimaginable there must be a third contingency to meet the case

I have already in another place suggested that the real difference between a *Ucs* and a *Pcs* idea (thought) consists in this that the former is worked out upon some sort of material which remains unrecognized whereas the latter (the *Pcs*) has in addition been brought into connection with verbal images This is the first attempt to find a distinguishing mark for the two systems the *Pcs* and the *Ucs* other than their relation to consciousness It would seem then that the question How does a thing become conscious? could be put more advantageously thus How does a thing become preconscious? And the answer would be By coming into connection with the verbal images that correspond to it

These verbal images are memory residues they were at one time perceptions and like all memory residues they can become conscious again Before we concern ourselves further with their nature it dawns upon us like a new discovery that only something which has once been a *Cs* perception can become conscious, and that anything arising from within (apart from feelings) that seeks to become conscious must try to transform itself into external perceptions this can be done by way of memory traces

We conceive of memory residues as contained in systems which are directly adjacent to the system *Pcpt Cs* so that the cathexes pertaining to the memory residues can readily extend outward on to the elements of the latter system We are immediately reminded of hallucinations here and of the fact that the most vivid memory is always distinguishable both from a hallucination and from an external perception but it will also occur to us that when a memory is revived the cathexis in the memory system will remain in force whereas a hallucination which is not distinguishable from a perception can arise when the cathexis does not merely extend over from the memory trace to the *Pcpt* element but passes over to it entirely

Verbal residues are derived primarily from auditory perceptions so that the system *Pcs* has as it were a special sensory source The visual components of verbal images are secondary acquired through reading and may to begin with be left on one side so may the sensory motor images of words which except with deaf mutes play an auxiliary part The essence of a word is after all the memory trace of a word that has been heard

We must not be led away in the interests of simplification perhaps into forgetting the importance of optical memory residues—those of *things* (as opposed to *words*)—or to deny that it is possible for thought processes to become conscious through a reversion to visual residues and that in many people this seems to be a favourite method The study of dreams and of preconscious phantasies on the lines of J Varendonck s observations gives us an idea of the special character of this visual thinking We learn that what becomes conscious is as a rule only the concrete subject matter of the thought and that the relations between the various elements of this subject matter which is what specially characterizes thought cannot

B y d tle Pl rr P p 4 8 bo *The U co sc pl* p 639 bo

with perception. Pain seems also to play a part in the process, and the way in which we gain new knowledge of our organs during painful illnesses is perhaps a prototype of the way by which in general we arrive at the idea of our own body.

The ego is first and foremost a body-ego; it is not merely a surface entity, but is itself the projection of a surface.[1] If we wish to find an anatomical analogy for it we can best identify it with the 'cortical homunculus' of the anatomists, which stands on its head in the cortex, sticks its heels into the air, faces backwards and, as we know, has its speech-area on the left-hand side.

The relation of the ego to consciousness has been gone into repeatedly; yet there are still some important facts in this connection which remain to be described. Accustomed as we are to taking our social or ethical standard of values along with us wherever we go, we feel no surprise at hearing that the scene of the activities of the lower passions is in the unconscious; we expect, moreover, that the higher any mental function ranks in our scale of values the more easily it will find access to consciousness assured to it. Here, however, psycho-analytic experience disappoints us. On the one hand, we have evidence that even subtle and intricate intellectual operations which ordinarily require strenuous concentration can equally be carried out preconsciously and without coming into consciousness. Instances of this are quite incontestable; they may occur, for instance, during sleep, as is shown when someone finds, immediately after waking, that he knows the solution of a difficult mathematical or other problem with which he had been wrestling in vain the day before.[2]

There is another phenomenon, however, which is far stranger. In our analyses we discover that there are people in whom the faculties of self-criticism and conscience—mental activities, that is, that rank as exceptionally high ones—are unconscious and unconsciously produce effects of the greatest importance; the example of resistances remaining unconscious during analysis is therefore by no means unique. But this new discovery, which compels us, in spite of our critical faculties, to speak of an *unconscious sense of guilt*, bewilders us far more than the other and sets us fresh problems, especially when we gradually come to see that in a great number of neuroses, this unconscious sense of guilt plays a decisive economic part and puts the most powerful obstacles in the way of recovery. If we come back once more to our scale of values we shall have to say that not only what is lowest but also what is highest in the ego can be unconscious. It is as if we were thus supplied with a proof of what we have just asserted of the conscious ego: that it is first and foremost a body-ego.

[1] I.e. the ego is ultimately derived from bodily sensations, chiefly from those springing from the surface of the body. It may thus be regarded as a mental projection of the surface of the body, besides, as we have seen above, representing the superficies of the mental apparatus.—Authorized note by the Translator.

[2] I was quite recently told an instance of this which was, in fact, brought up as an objection against my description of the dream-work.

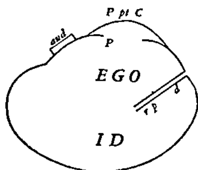
III. THE EGO AND THE SUPER-EGO (EGO-IDEAL)

If the ego were merely the part of the id modified by the influence of the perceptual system, the representative in the mind of the real external world, we should have a simple state of things to deal with. But there is a further complication.

The considerations that led us to assume the existence of a differentiating grade within the ego, which may be called the *ego-ideal* or *super-ego*, have been set forth elsewhere.[1] They still hold good.[2] The new proposition which must now be gone into is that this part of the ego is less closely connected with consciousness than the rest.

At this point we must widen our range a little. We succeeded in explaining the painful disorder of melancholia by supposing that, in those suffering from it, an object which was lost has been reinstated within the ego; that is, that an object-cathexis has been replaced by an identification.[3] When this explanation was first proposed, however, we did not appreciate the full significance of the process and did not know how common and how typical it is. Since then we have come to understand that this kind of substitution has a great share in determining the form taken on by the ego and that it contributes materially towards building up what is called its *character*.

[1] *On Narcissism: an Introduction* [p. 3[illegible]9 above] and *Group Psychology and the Analysis of the Ego* [p. 65[illegible] above].



[2] Except that I seem to have been mistaken in ascribing the function of testing the reality of things to this super-ego—a point which needs correction. The view that the testing of reality is rather one of the functions of the ego itself would fit in perfectly with what we know of the relations of the ego to the world of perception. Some earlier suggestions about a 'nucleus of the ego', never very definitely formulated, also require to be put right, since the system *Pcpt-Cs* alone can be regarded as the nucleus of the ego.

[3] 'Mourning and Melancholia' (1917), *Collected Papers*, IV.

I am speaking of Georg Groddeck who is never tired of pointing out that the conduct through life of what we call our ego is essentially passive and that as he expresses it we are lived by unknown and uncontrollable forces We have all had impressions of the same kind even though they may not have overwhelmed us to the exclusion of all others and we need feel no hesitation in finding a place for Groddeck s discovery in the fabric of science I propose to take it into account by calling the entity which starts out from the system *Pcpt* and begins by being *Pcs* the *ego* and by following Groddeck in givin to the other part of the mind into which this entity extends and which behaves as though it were *Ucs* the name of *Id (Es)*

We shall soon see whether this conception affords us any gain in understandin or any advantage for purposes of description We shall now look upon the mind of an individual as an unknown and unconscious id upon whose surface rests the ego developed from its nucleus the *Pcpt* system If we make an effort to conceive of this pictorially we may add that the ego does not envelop the whole of the id but only does so to the extent to which the system *Pcpt* forms its surface more or less as the germinal layer rests upon the ovum The ego is not sharply separated from the id its lower portion merges into it

But the repressed merges into the id as well and is simply a part of it The repressed is only cut off harply from the ego by the resistances

F g 1

of repression it can communicate with the ego through the id We at once realize that almost all the delimitations we have been led into out lining by our study of pathology relate only to the superficial levels of the mental apparatus —the only ones known to us The state of things which we have been describing can be represented dia rammatically (Fig 1) thou h it must be remarked that the form chosen has no pretensions to any special applicability but is merely intended to serve for purposes of ex position We mi ht add perhaps that the ego wears an auditory lobe—on one side only as we learn from cerebral anatomy It wears it crooked as one might say

It is easy to see that the ego is that part of the id which has been modified by the direct influence of the external world acting through the *Pcpt Cs* in a sense it is an extension c the surface differentiation Moreover the eg has the task of bringin the influence of th external world to bear upon the id and its tendencies and endeavours to substitute the reality principle for the pleasure principle which reigns supreme in the id In the ego perception plays the part which in the id devolves upon instinct The ego represents what we call reason and sanity in contrast to the id which contains the passions All this falls into line with popular distinctions which we are all familiar with at the same time however it is only to be regarded as holding good in an average or ideal case

The functional importance of the ego is manifested in the fact that normally control over the approaches to motility devolves upon it Thus in its relation to the id it is like a man on horseback who has to hold in check the superior strength of the horse with this dif ference that the rider seeks to do so with his own strength while the ego uses borrowed forces The illustration may be carried further Often a rider if he is not to be parted from his horse is obliged to guide it where it wants to go so in the same way the ego constantly carries into action the wishes of the id as if they were its own

It seems that another factor besides the influence of the system *Pcpt* has been at work in bringing about the formation of the ego and its differentiation from the id The body itself and above all its surface is a place from which both external and internal perceptions may spring It is seen in the same way as any other ob h

discussed the manner in which the body attains its special position among other objects in the

very beginning in the primitive oral [illegible] of the individual's existence object [illegible] and identification are hardly to be [illegible]uished from each other We can only suppose that later on object cathexes proceed from the id in which erotic trends are felt as needs The ego which at its inception is still far from robust becomes aware of the object cathexes and either acquiesces in them or tries to defend itself against them by the process of repression

When it happens that a person has to give up a sexual object there quite often ensues a modification in his ego which can only be described as a reinstatement of the object within the ego as it occurs in melancholia the exact nature of this substitution is as yet unknown to us It may be that by undertaking this introjection which is a kind of regression to the mechanism of the oral phase the ego makes it easier for an object to be given up or renders that process possible It may even be that this identification is the sole condition under which the id can give up its objects At any rate the process especially in the early phases of development is a very frequent one and it points to the conclusion that the character of the ego is a precipitate of abandoned object cathexes and that it contains a record of past object choices It must of course be admitted from the outset that there are varying degrees of capacity for resistance as shown by the extent to which the character of any particular person accepts or resists the influences of the erotic object choices through which he has lived In women who have had many love affairs there seems to be no difficulty in finding vesti es of their object cathexes in the traits of their character We must also take into consideration the case of simultaneous object cathexis and identification i e in which the alteration in character occurs before the object has been given up In such a case the alteration in character would be able to survive the object relation and in a certain sense to conserve it

From another point of view it may be said that this transformation of an erotic object choice into a modification of the ego is also a method by which the ego can obtain control over the id and deepen its relations with it—at the cost it is true of acquiescin to a large extent in the id's experiences When the ego assumes the features of the object it forces itself so to speak upon the id as a love-object and tries to make good the loss of that object by saying Look I am so like the object you can as well love me

The transformation of object libido into narcissistic libido which thus takes place obviously implies an abandonment of sexual aims a process of desexualization it is consequently a kind of sublimation Indeed the question arises and deserves careful consideration whether this is not always the path taken in sublimation whether all sublimation does not take place through the agency of the ego which begins by changing sexual object libido into narcissistic libido and then perhaps goes on to give it another aim We shall later on have to consider whether other instinctual vicissitudes may not also result from this transformation whether for instance it may not bring about a defusion of the instincts that are fused together

Althou h it is a digression from our theme we cannot avoid giving our attention for a moment lon er to the ego's object identifications If they obtain the upper hand and become too numerous unduly intense and incompatible with one another a patholo ical outcome will not be far off It may come to a disruption of the ego in consequence of the individual identifications becomin cut off from one another by re istances perhaps the secret of the ca es of so called *multiple pe sonality* is that the various identifications seize possession of consciousness in turn Even when things do not go so far as this there remains the question of conflicts between the different identifications into which the ego is split up conflicts which cannot after all be described as purely pathological

But whatever the character's capacity for resisting the influences of abandoned object cathexes may turn out to be in after years the effects of the first identifications in earliest childhood will be profound and lasting This leads us back to the origin of the ego ideal for

from the very beginnin attributed the func tion of instituting repression to the moral and aesthetic tendencies in the ego and secondly there has been general refusal to recognize that psycho-analytic research could not produce a complete and finished body of doctrine like a philosophical system, ready made but had to find its way step by step along the path towards understanding the intricacies of the mind by making an analytic dissection of both normal and abnormal phenomena. So long as the study of the repressed part of the mind was our task, there was no need for us to feel any agitated apprehensions about the existence of the higher side of mental life. But now that we have embarked upon the analysis of the ego, we can give an answer to all those whose moral sense has been shocked and who have complained that there must surely be a higher nature in man. Very true we can say and here we have that higher nature in this ego-ideal or super-ego the representative of our relation to our parents. When we were little children we knew these higher natures we admired them and feared them and later we took them into ourselves.

The ego-ideal, therefore is the heir of the Oedipus complex and thus it is also the expression of the most powerful impulses and most important vicissitudes experienced by the libido in the id. By setting up this ego-ideal, the ego masters its Oedipus complex and at the same time places itself in subjection to the id. Whereas the ego is essentially the representative of the external world, of reality the super-ego stands in contrast to it as the representative of the internal world of the id. Conflicts between the ego and the ideal will as we are now prepared to find, ultimately reflect the contrast between what is real and what is mental between the external world and the internal world.

Through the forming of the ideal all the traces left behind in the id by biological developments and by the vicissitudes gone through by the human race are taken over by the ego and lived through again by it in each individual. Owing to the way in which it is formed, the ego-ideal has a great many points of contact with the phylogenetic endowment of each individual—his archaic heritage. And thus it is that what belongs to the lowest depths in the minds of each of us is changed through this formation of the ideal into what we value as the highest in the human soul. It would be vain, however to attempt to localize the ego-ideal, even in the sense in which we have localized the ego, or to work it into any of those analogies with the help of which we have tried to picture the relation between the ego and the id.

It is easy to show that the ego-ideal answers in every way to what is expected of the higher nature of man. In so far as it is a substitute for the longing for a father it contains the germ from which all religions have evolved. The self judgment which declares that the ego falls short of its ideal produces the sense of worthlessness with which the religious believer attests his longing. As a child grows up, the office of father is carried on by masters and by others in authority the power of their injunctions and prohibitions remains vested in the ego-ideal and continues in the form of conscience, to exercise the censorship of morals. The tension between the demands of conscience and the actual attainments of the ego is experienced as a sense of guilt. Social feelings rest on the foundation of identifications with others on the basis of an ego-ideal in common with them.

Religion, morality and a social sense—the chief elements of what is highest in man—were originally one and the same thing. According to the hypothesis which I have put forward in *Totem and Taboo* they were acquired phylogenetically out of the father-complex religion and moral restraint by the actual process of mastering the Oedipus complex itself and social feeling from the necessity for overcoming the rivalry that then remained between the members of the younger generation. It seems that the male sex has taken the lead in developing all of these moral acquisitions and that they have then been transmitted to women by cross-inheritance. Even today the social feelings arise in the individual as a superstructure founded upon impulses of jealousy and rivalry against his brothers and sisters. Since the enmity cannot be gratified there develops an identification with the former rival. The study of mild cases of homosexuality confirms the suspicion that in this instance too the identification is a substitute for an affectionate object-choice which has succeeded the hostile aggressive attitude.

With the mention of phylogenesis however

I am not the moment putting science and art on one side

Cf *Group Psychology and the Analysis of the Ego* p 66 et seq and "Certain Neurotic Mechanisms in Jealousy, Paranoia, and Homosexuality" (19) *Collected Papers* II.

with the earliest object choices and identifications and still more difficult to describe them intelligibly It may even be that the ambivalence displayed in the relations to the parents should be attributed entirely to bisexuality and that it is not as I stated just now developed out of an identification in consequence of rivalry

In my opinion it is advisable in p n l quite e n to assu comple ute then shows that in a number of cases one or the other of its constituents disappears except for barely distinguishable traces so that a series can be formed with the normal positive Oedipus complex at one end and the inverted negative one at the other while its intermediate members will exhibit the complete type with one or other of its two constituents preponderating As the Oedipus complex dissolves the four trends of which it consists will group themselves in such a way as to produce a father identification and a mother identification The father identification will preserve the object relation to the mother which belonged to the positive complex and will at the same time take the place of the object relation to the father which belonged to the inverted complex and the same will be true *mutatis mutandis* of the mother identification The relative intensity of the two identifications in any individual will reflect the preponderance in him of one or other of the two sexual dispositions

The broad general outcome of the sexual phase governed by the Oedipus complex may therefore be taken to be the forming of a precipitate in the ego consisting of these two identifications in some way combined together This modification of the ego retains its special position it stands in contrast to the other constituents of the ego in the form of an ego ideal or super-ego

The super ego is however not merely a deposit left by the earliest object choices of the id it also represents an energetic reaction formation against those choices Its relation to the ego is not exhausted by the precept You *ought to be* such and such (like your father) it also comprises the prohibition "You *must not be* such and such (like your father) that is you may not do all that he does many thin s are his prerogative Thus double aspect of the ego ideal derives from the fact that the ego ideal had the task of effecting the repression of the Oedipus complex indeed it is to that revolutionary event that it owes its existence Clearly the repression of the Oedipus complex was no easy task The parents and especially the father were perceived as the obstacle to realization of the Oedipus wishes so the child s ego brought in a reinforcement to help in carrying out the repression by erecting this same obstacle within itself The strength to do this was so to speak borrowed from the father and this loan was an extraordinarily momentous act The super-ego retains the character of the father while the more intense the Oedipus complex w d more the schoc on is tion of the super ego over the ego—in the form of conscience or perhaps of an unconscious sense of guilt I shall later on bring forward a suggestion about the source of the power it employs to dominate in this way the source that is of its compulsive character which manifests itself in the form of a cate orical imperative

If we consider once more the origin of the super ego as we have described it we shall perceive it to be the outcome of two highly important factors one of them biological and the other historical namely the lengthy duration in man of the helplessness and dependence belonging to childhood and the fact of his Oedipus complex the repression of which we have shown to be connected with the interruption of libidinal development by the latency period and so with the twofold onset of activity characteristic of man s sexual life According to the view of one psycho analyst the last mentioned phenomenon which seems to be peculiar to man is a heritage of the cultural development necessitated by the glacial epoch We see then that the differentiation of the super-ego from the ego is no matter of chance it stand as the representative of the most important events in the development both of the individual and of the race indeed by giving permanent expression to the influence of the parents it perpetuates the existence of the factors to which it owes its origin

Psycho analysis has been reproached time after time with ignoring the higher moral spiritual side of human nature The reproach is doubly unjust both historically and methodologically For in the first place we have

The necessary cha g s be g made —ED

Th s t c eprese ts a l ght m d fcati f the o gi al te t cco d ce w th d rect instructi f om th tho —TR.

morganic state on the other hand we supposed that Eros aims at complicating life by bringing about a more and more far reaching coalescence of the particles into which living matter has been dispersed thus of course aiming at the maintenance of life. Acting in this way both the instincts would be conservative in the strictest sense of the word since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life The appearance of life would thus be regarded as the cause of the continuance of life and also as the cause of the striving towards death and life itself would be a conflict and compromise between these two trends The problem of the origin of life would remain a cosmological one and the problem of the purpose and goal of life would be answered dualistically

On this view a special physiological process (of anabolism or katabolism) would be associated with each of the two classes of instincts both instincts would be active in every particle of living substance although in unequal proportions so that some one substance might be the principal representative of Eros.

This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused blended and mingled with each other but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life the death-instinct of the single cell can successfully be neutralized and the destructive impulses be diverted towards the external world through the instrumentality of a special organ This special organ would seem to be the musculature and the death instinct would thus seem to express itself—though probably only in part—as an instinct of destruction directed against the external world and other living organisms

Once we have admitted the conception of a fusion of the two classes of instincts with each other the possibility of a—more or less complete—*defusion* of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of instinctual fusion serving a useful purpose and the perversion in which sadism has made itself independent would be typical of defusion though not of a completely complete defusion. From this point we obtain a new view of a great array of facts which have not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually enlisted in the service of Eros we suspect that the epileptic fit is a product and sign of instinctual *defusion* and we come to understand that defusion and the marked emergence of the death instinct are among the most noteworthy effects of many severe neuroses e.g. the obsessional neuroses Making a swift generalization we might conjecture that the essence of a regression of libido e.g. from the genital to the sadistic anal level would lie in a defusion of instincts just as conversely the advance from an earlier to the definitive genital phase would be conditioned by an accession of *erotic components* The question also arises whether ordinary ambivalence which is so often unusually strong in the constitutional disposition to neurosis should not be regarded as the product of a defusion ambivalence however is such a fundamental phenomenon that it more probably represents a state of incomplete fusion.

It is natural that we should now turn with interest to inquire whether there may not be instructive connections to be traced between the formations we have assumed to exist in the mind—the ego the super-ego and the id—and the two classes of instincts and further whether the pleasure principle which dominates mental processes can be shown to have any *constant relation* both to the two classes of instincts and to these differentiations which we have drawn within the mind But before we discuss this we must clear away a doubt which arises concerning the terms of the problem itself There can be no doubt about the pleasure principle and the differentiations within the ego have good clinical justification but the distinction between the two classes of instincts does not seem sufficiently assured and it is possible that facts of clinical analysis may be found to conflict with it.

tive of Eros but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, for which hate points the way) Now clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence) and not only that in human relationships hate is frequently a forerunner of love but also that in many circumstances hate changes into love and love into hate. If this change is anything more than a mere succession

fresh problems arise from which one is tempted to shrink back dismayed But there is no help for it the attempt must be made in spite of a fear that it will lay bare the inadequacy of the whole structure that we have so arduously built up The question is which was it the ego of primitive man or his id that acquired religion and morality in those early days out of the father complex? If it was his ego why do we not speak simply of these things being inherited by the ego? If it was the id how does that agree with the character of the id? Or are we wrong in carrying the differentiation between ego super ego and id back into such early times? Or should we not honestly confess that our whole conception of the processes within the ego is of no help in understanding phylogenesis and cannot be applied to it?

Let us answer first what is easiest to answer The differentiation between ego and id must be attributed not only to primitive man but even to much simpler forms of life for it is the inevitable expression of the influence of the external world The super ego according to our hypothesis actually originated from the experiences that led to totemism The question whether it was the ego or the id that experienced and acquired these things soon cea es to have any meaning Reflection at once shows us that no external vicissitudes can be experienced or undergone by the id except by way of the ego which is the representative of the outer world to the id Nevertheless it is not possible to speak of direct inheritance by the ego It is here that the gulf between the actual individual and the conception of the species becomes evident Moreover one must not take the difference between ego and id in too hard and fast a sense nor forget that the ego is a part of the id which has been specially modified The experiences undergone by the ego seem at first to be lost to posterity but when they have been repeated often enough and with sufficient intensity in the successive individuals of many generations they transform themselves so to say into experiences of the id the impress of which is preserved by inheritance Thus in the id which is capable of being inherited are stored up vestiges of the existences led by countless former egos and when the ego forms its super ego out of the id it may perhaps only be reviving images of egos that have passed away and be securing them a resurrection

The way in which the super-ego came into being explains how it is that the earlier conflicts of the ego with the object-cathexes of the id can be carried on and continued in conflicts with their successor the super ego If the ego has not succeeded in mastering the Oedipus complex satisfactorily the energic cathexis of the latter springing from the id will find an outlet in the reaction formations of the ego-ideal The very free communication possible between the ideal and these *Ucs* instinctual trends explains how it is that the ideal itself can be to a great extent unconscious and inaccessible to the ego The struggle which once raged in the deepest strata of the mind and was not brought to an end by rapid sublimation and identification is now carried on in a hi her region like the Battle of the Huns which in Kaulbach s painting is being fought out in the sky

IV THE TWO CLASSES OF INSTINCTS

WE have already said that if the differentiation we have made of the mind into an id an ego and a super ego represents any advance in our knowledge it ought to enable us to understand more thoroughly the dynamic relations within the mind and to describe them more clearly We have also already reached the conclusion that the ego is especially affected by perception and that speaking broadly perceptions may be said to have the same significance for the ego as instincts have for the id At the same time the ego is subject to the influence of the instincts too like the id of which it is in fact only a specially modified part

I have lately developed a view of the instincts which I shall here hold to and take as the basis of further discussions According to this view we have to distinguish two classes of instincts one of which Eros or the sexual instincts is by far the more conspicuous and accessible to study It comprises not merely the uninhibited sexual instinct proper and the impulses of a sublimated or aim inhibited nature derived from it but also the self pre erva tive instinct which must be assigned to the ego and which at the beginning of our analytic work we had good reason for setting in opposition to the sexual object instincts The second class of instincts was not so easy to define in the end we came to recognize sadism as its representative As a result of theoretical considerations supported by biology we assumed the existence of a death instinct the task of which is to lead organic matter back into the

Bey d th Pl P pl p 639 abo e.

know this trait it is characteri tic of the ca thetic processes in the id. It is found in erotic ca_ses where a peculiar indiffere ce in regard to the object displays itself and it is especiall ev dent in the tran_ferences arising in analysis which develop ine itabl no matter who the analyst may be Rank has recently pu__ed some good examples of the way in hich neurotic acts of revenge can be directed against the wrong people Such beha our on the part f the unconsci us reminds one of the comic st ry f the three illage tailors, one of whom had t be hanged becau e the only vil lage blacksmith had comm tted a cap tal of fence The penalty mu t be exa t d e en if t

objects that were thus relegated to a positi n of no m re than seco dary importance just as in th case we are now discu_sing it is the paths of discharge It would seem to be char acteristic f the eg to be more particular both about the ch ce of an object and about the path f discharge.

If this displaceabl en rgy is desexualized lib d t might al_o be described as ublimated energy for t would till retain th main pur pose of Eros—that of uniting and binding—in so far as it h lped toward establishing that unity r tendency to unity which is particu larly characteristi of the go If th tell ctual proces_es in the wider ens ar to be cla_sed among these displacement then the energy for the w k f th ht tself must be upplied from sublimated e t our es

Here w arri gain t th possibility which has already been discu sed that s blim tion may take pla regula ly through the mediati n of the eg The ther cas will be recollected, in which the ego deals with the first object cathexes f th d (and ertainly with lat o es too) by taking e th lib do from them int i self and binding t to the ego-modification produced by means f dentificatio Th trans formation f rotic lib d int ego-lib d of course in l es an band nme t of sexual aims a desexualization In any case this throw light upon an important fun tion f the ego in ts relation t Er By thus obtaining posses_ f the lib d from the bject-cathexes setting itself up sol lo e-obj ct and des xualizin_ o sublim ting th lib d f th id th eg is w king in oppo tion t th purposes of E os and placing itself at th serv ce of the oppos

ing instinctual trends It has to acquiesce in some of the other object-cathexes of the id it has to go hand in hand with them so to speak. We shall come back later to another poss ble consequence of this activ ty of the ego

Th would eem to imply an important am plificat on of the theory of narcissism At the very beginning all the l b do is accumulated in the id while the ego is st ll in process of forma tion or far from robust. Part of this l b do is sent out by the id into erotic object-cathexes whereupon the *ego now growing stronger* at tempts to obtain posses ion of this object lib d and to force itself upon the id as a love object *The narc ssism of the ego is thus een* to be secondary acqu red by the w thdrawal of the lib do fr m objects.

Over and over again we find on tracin in stinctual impulses back that th y disclose them sel es as deri atives of Eros If it were not for the con_ derations put forwa d in *Beyond the Pleasure Principle* and ultimately for the sadis-

th r nature mute and that the clamour of lif pro eeds fo the most part from Eros

And fr m the struggle against Eros[1] It can hardly be doubted that th pleasure-pri ciple serves the id as a compass in its struggle against

constant equilibrium, it onsi ts of a contin ous des ent t wards death but the falling f the le el is d layed and fresh tensions are intro duced, by the claims of Eros of the sexual in stincts as expressed in instinctual needs. The id guided by the pleasure principle, that is by th perception of "pain guards tself against thes tensions in arious ways It does so in the first pla by complying as sw ftly as pos sibl with th demands of the non-desexualized lib do i e. by tr ing f th gratificati n f the directly sexual tre ds But it does so fur ther and in f more comprehensive fashion in relation to one particul r form of gratifica tio which s bsum all compo ent laims— that s by discharge of the exual sub tances which re turated o ductors o t speak, f the erotic ten_ions The j ct n f sexual sub

[1] I f cco ding to view i Is throu h the gency f Eros tha the destructi ins ncts that are directed wa ds the external world ha been di rted from the self.

in time then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts one which presupposes the existence of physiological processes running counter to each other

Now the case in which someone first loves and then hates the same person (or the reverse) because that person has given him cause for doing so has obviously nothing to do with our problem Nor has the other case in which feelings of love that have not yet become manifest express themselves to begin with by enmity and aggressive tendencies for it may be that here the destructive components in the object cathexis have outstripped the erotic and are only later on joined by the latter But we know of several instances in the psychology of the neuroses in which there are better grounds for assuming that a transformation does take place In persecutory paranoia the sufferer takes a particular way of defending himself against an unduly strong homosexual attachment to a given person with the result that the person he once loved most is changed into a persecutor and then becomes the object of aggressive and often dangerous impulses on the part of the patient Here we have grounds for interposing an intermediate phase in which the love is transformed into hate Analytic investigation has only lately revealed that the sources of homosexuality and of desexualized social feelings include very intense feelings of rivalry giving rise to aggressive desires which after they have been surmounted are succeeded by love for the object that was formerly hated or by an identification with it The question arises whether in these instances we are to assume a direct transformation of hate into love It is clear that here the chan es are purely internal and an alteration in the behaviour of the object plays no part in them

There is another possible mechanism however which we have come to know of by analytic investigation of the processes concerned in the change in paranoia An ambivalent attitude is present from the outset and the transformation is effected by means of a reactive shifting of cathexis by which energy is withdrawn from the erotic impulses and used to supplement the hostile energy

Not quite the same thing but something like it happens when a hostile attitude of rivalry is overcome and leads to homosexuality The hostile attitude has no prospect of gratification consequently—i e as an economic measure—it is replaced by a loving attitude for which there is more hope of satisfaction that is possibility of discharge So we see that we are not obliged in either of these cases to assume a direct transformation of hate into love which would be incompatible with a qualitative distinction between the two classes of instincts

It appears however that by including in our calculations this other mechanism by means of which love can be changed into hate we have tacitly made another assumption which deserves to be formulated explicitly We have reckoned as though there existed in the mind—whether in the ego or in the id—a displaceable energy which is in itself neutral but is able to join forces either with an erotic or with a destructive impulse differing qualitatively as they do and augment its total cathexis Without assuming the existence of a displaceable energy of this kind we can make no headway The only question is where it comes from what it belongs to and what it signifies

The problem of the quality of instinctual impulses and of its persistence throughout their vicissitudes is still very obscure and has hardly been attacked up to the present In the ems l compon

a what we are discussing e.g we see that some degree of communication exists between the component instincts that an instinct deriving from one particular erotogenic source can make over its intensity to reinforce another component instinct originatin in another source that gratification of one instinct can take the place of gratification of another and many more facts of the same nature—all of which must encourage us to venture upon certain assumptions

In the present discussion moreover I am putting forward nothing but a supposition I have no proof to offer It seems a plausible view that this neutral displaceable energy which is probably active alike in the ego and in the id proceeds from the narcissistic reservoir of libido i e that it is desexualized Eros (The erotic instincts appear to be altogether more plastic more readily diverted and displaced than the destructive instincts) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate accumulations and to facilitate discharge It is clear incidentally that there is a certain indifference about the path along which the discharge takes place so long as it takes place somehow We

far cees as narcissistic inaccessibility the assumption of a negative attitude towards the physician, or a clinging to the advantages of the illness.

In the end we come to see that we are dealing with what may be called a "moral" factor a sense of guilt which is finding atonement in the illness and is refusin to give up the penalty of suffering We are justified in regarding this rather disheartening explanation as conclusive. But, as far as the patient is concerned this sense of guilt is dumb it does not tell him h is guilty he does not feel guilty he mply feels ill. This ense f guilt expresses itself only as a resistance to recovery which it is extrem ly difficult to o e come It is also par ticularly difficult to con ince the patient that this mo e lies behind his continuing to be ill h h ds fast to the more obvious explanation that treatment by analysis is not the right remedy for his case.

The description we have given applies t the most extrem instances of this state of affairs but in a lesser measure this factor has to be reckoned with in very many cases perhaps in all severe cases of neurosis In fact t may be precisely this element in th s tuat on the attitud f the ego- deal that determines the severity of eur tic illness. W hall n t hesitat therefore to discu rath more f lly the way in which th sense of guilt expresses itself under different conditions

An explanat on of the normal conscious sense of guilt (conscience) prese ts no difficulties t is due to tens on between the ego and the ego-ideal and is the expression of a condem nation of the ego pronounced by its criticizing funct on The feel ngs of inferiority so well known in neurotics are presumably closely re lated to it In two very familiar malad es the sense of guilt is o er strongly conscious in them the ego-ideal displays particular severity and often rages against the ego with the utmost cruelty The attitude of the ego-ideal in these two diseases the obsessional neurosis and melancholia presents al ngs de of this sim ilarity differences that are no less sign ficant

In certain forms of the obses onal neurosis th sense of guilt expresses itself loudly but cannot justify itself to the ego Consequently

shows that the uper-ego is being influenced by processes that have remained hidden from the ego It is pos ble to discover the repressed impulses which really occasion the sense of guilt. The super-ego is thus pro ed to have known more than the ego about the unconscious id.

difference is plain. In the obsessional neuros s, the repreh ns ble impulses which are being criticized by the super-ego ha e never formed part of the ego while in melancholia, the object of the super-ego s wrath has become part of the ego through dentification

It is certainly not clear why the sense of guilt reaches such an xtraordinary inten ty in these tw eurotic disorders and i d ed the main problem presented in this state of affairs lies in another direction We shall post pone discussion of it until we ha e d alt with the othe cases—in which the sense of guilt remains unconscious

It is esse tially in hysteria and in states of an hysterical type that this condition is found. The me hanism by which the sense of guilt is kept un onscious is easy to discover Th h sterical type of eg defends tself from the painful perception which th criticisms f its super-ego thre ten to produc in t by the same means that t uses to defend tself from an

stances in the sexual act corresponds in a certain degree with the separation of soma and germ plasm This accounts for the likeness between dying and the condition that follows complete sexual satisfaction and for the fact that death coincides with the act of copulation in some of the lower animals These creatures die in the act of reproduction because after Eros has been eliminated through the process of gratification the death instinct has a free hand for accomplishing its purposes Finally as we have seen the ego by sublimating some of the libido for itself and its purposes assists the id in its work of mastering the tensions

V THE SUBORDINATE RELATIONSHIPS OF THE EGO

THE complexity of our subject matter must be an excuse for the fact that none of the chapter headings of this book correspond entirely to their contents and that in turning to new aspects of the problem we constantly hark back to matters that have already been dealt with

As has been said repeatedly the ego is formed to a great extent out of identifications taking the place of cathexes on the part of the id which have been abandoned the earliest of these identifications always fulfil a special office in the ego and stand apart from the rest of the ego in the form of a super ego while later on as it grows stronger the ego may become more able to withstand the effects of identifications The super ego ow [illegible]
[illegible]
[illegible]
[illegible] that on the one hand it was the first identification and one which took place while the ego was still feeble and that on the other hand it was the heir to the Oedipus complex and thus incorporated into the ego objects of far greater significance than any others The super ego s relation to the subsequent modifications effected in the ego is roughly that of the primary sexual period in childhood to full grown sexual activity after puberty Although it is amenable to every later influence it preserves throughout life the character given to it by its derivation from the father complex namely the capacity to stand apart from the ego and to rule it It is a memorial of the former weakness and dependence of the ego and the mature ego remains subject to its domination As the child was once compelled to obey its parents so the e o submits to the categorical imperative pronounced by its super-ego

The descent of the super e o from the first object cathexes of the id from the Oedipus complex however signifies even more for it This descent as we have already described connects it with the phylogenetic acquisitions of the id and makes it a reincarnation of former ego structures which have left their precipitates behind in the id Thus the super-ego is always in close touch with the id and can act as its representative in relation to the ego It reaches deep down into the id and is for that reason farther from consciousness than the ego

We can best appreciate these relations by turning our attention to certain clinical facts which have long since lost their novelty but which still await theoretical discussion

There are certain people who behave in a quite peculiar fashion during the work of analysis When one speaks hopefully to them or expresses satisfaction with the progress of the treatment they show signs of discontent and their condition invariably becomes worse One begins by regarding this as defiance and as an attempt to prove their superiority to the physician but later one comes to take a deeper and truer view One becomes convinced not only that such people cannot endure any praise or appreciation but that they react inversely to the progress of the treatment Every partial solution that ought to result and in other people does result in an improvement or a temporary suspension of symptoms produces in them for the time being an exacerbation of their illness they get worse during the treatment instead of getting better They exhibit the so called *negative therapeutic reaction*

There is no doubt that there is something in these people that sets itself against their recovery and dreads its approach as though it were a danger We are accustomed to say that the need for illness has got the upper hand in them over the desire for health If we analyse this resistance in the usual way—then even after we have subtracted from it the defiant attitude towards the physician and the fixation on the various kinds of advantage which the patient derives from the illness the greater part of it is still left over and this reveals itself as the most powerful of all obstacles to recovery more powerful even than such fam

It m y be d th t th psy h lytical m te p y h l g al g t ds it h d l ss tha the t m cal go—the *c ltcal h m cul s*

is interminable self torment and eventually there follows a systematic torturing of the object, in so far as it is within reach.

The activity of the dange ous death instincts — wi h

world in the form of aggress on while for the most part they undoubtedly co t ue their inner wo k unhindered How is t then that in melanch lia the super-ego can becom a ki d of gathering-place for the death nstincts?

From the point f v ew of m rality the co trol and restrictio of instinct t may be aid f th d that t is tot lly non moral of the ego that it stri es to be m ral and of the super ego that it ca be hype m ral nd then be comes as ruthless only th id can be It is remarkabl that the more a man checks his aggressive tendencies towards others the more tyrannical that i agres ve he becomes n his ego-ideal. Th ordinary v ew see th situa tio th th way round th sta dard set p by the ego- deal seems t be the moti e for the suppression of g resa e ess The f ct re mains h weve we ha e stated it th more a —

ment, turning round upo the se b t e n ordinary ormal morality has harshly re straining ru lly p ohib ti g quality It from this, indeed that the o c ptio ari es of an m rable h gher being who metes out puni h ment.

I cannot go f rth r n my co sid ration of these questions w tho t trod cing a f esh assumption. The super-ego rises as we know from an dentificati with the fathe rega ded as a mod l. E ery such identificatio is in the nature of a desexualizati n r even f sub-limati n. It ow seems s tho gh when a transformation of thi kind takes place th e occurs at th sam time an instin tual defusion After blimat the rotic c mpo e t o l ng has the po er t bind the wh le of the destructi e el ment that were prev u ly com bined with t d these rel ed in the form of in li ti ns t aggression and destruc ti n. This defus on w uld be the sou e f the gen ral characte of harshness d cruelty ex hib ted by the deal—its dictatorial 'Thou shalt.

Let us again consid r th bsess o al n u-rosis for a moment The tate of affairs is

mixed w th the i b o

Our ideas about the ego are begin ng to cl r and its various relation hips are ga ning distinct es We now see the ego in its strength and in its weaknesses It is entrusted wi h im porta t funct o s By v rtue of its relation to the perceptual system it arranges the processes of the m d a t mporal order and tests the r correspo d nce with real ty By interpo g the proce s of th nking it secures a postponement of motor di harges a d co trols the a enues t mot lity This last office is to be ure a quest on more of form than of fact in the matte of act n the ego s pos tion is l ke that of a constitut onal monarch without whose sanctio no law can be pas ed but who hesitates long befor impo ng veto on any measure put f rward by Parl ment All the experiences of life that originat from w thout enrich the ego the d however s another outer w ld to t which it tri es t b ng into subject on to tself It w thdraws lib do from the d a d tran forms the object-c th es of the id to ego-co structions With th aid of the super ego th gh in a m nner that is till obscure to us it draws upon the expe iences of pa t ages stored in the id

There are two paths by which the c te ts of the id can *penetrate into the ego* The o e is direct the other leads by way of the ego-deal which f these tw paths they take may for many mental act it es be of d e importance. The ego develops from perc n *instincts to co trollin th m* from obe g instincts t curbing them I this achievement a larg ha taken by the ego-ideal whi h indeed is partly a reaction f rm ti n aga t the inst t l proce es in th d Psy ho-analys s is an nstrume t t enable the ego to push ts c quest of the d further still

F m the th r point of v ew h wever we see thi same ego as a poor creature owing erv e to three masters d consequently menaced by three everal dangers from the

unendurable object cathexis—by an act of repression It is the ego therefore that is responsible for the sense of guilt remaining unconscious We know that as a rule the ego carries out repressions in the service and at the behest of its super ego but this is a case in which it has turned the same weapon against its harsh taskmaster In the obsessional neurosis as we know the phenomena of reaction formation predominate but here the ego contents itself with keeping at a distance the material to which the sense of guilt refers

One may go further and venture the hypothesis that a great part of the sense of guilt must normally remain unconscious because the origin of conscience is closely connected with the Oedipus complex which belongs to the unconscious If any one were inclined to put forward the paradoxical proposition that the normal man is not only far more immoral than he believes but also far more moral than he has any idea of psycho analysis which is responsible for the first half of the assertion would have no objection to raise against the second half

It was a surprise to find that exacerbation of this *Ucs* sense of guilt could turn people into criminals But it is undoubtedly a fact In many criminals especially youthful ones it is possible to detect a very powerful sense of guilt which existed before the crime and is not therefore the result of it but its motive It is as if it had been a relief to be able to fasten this unconscious sense of guilt on to something real and immediate

In all these situations the super ego displays its independence of the conscious ego and the closeness of its relations with the unconscious id And now having regard to the importance we ascribed to preconscious verbal residues in the ego the question arises whether the super ego if it is in part unconscious can consist in such verbal images or if not in what it does consist Our answer though it does not carry us very far will be that it cannot possibly be disputed that the super ego no less than the ego is derived from auditory impressions it is part of the ego and remains to a great extent accessible to consciousness by way of these verbal images (concepts abstractions) but the cathectic energy of these elements of the super ego does not originate from the auditory perceptions instruction reading etc but from sources in the id

The question which we postponed answering runs thus How is it that the super-ego manifests itself essentially as a ense of guilt (or rather as criticism—for the sense of guilt is the perception in the ego which correspond to the criticism) and at the same time develops such extraordinary harshness and severity towards the ego? If we turn to melancholia first we find that the excessively strong super-ego which has obtained a hold upon consciou ness rages against the ego with merciless fury as if it had taken possession of the whole of the sadism available in the person concerned Following our view of sadism we should say that the destructive component had entrenched itself in the super ego and turned against the ego What is now holding sway in the super-ego is as it were a pure culture of the death instinct and in fact it often enough succeeds in driving the ego into death if the latter does not protect itself from the tyrant in time by a revulsion into mania

The reproaches of conscience in certain forms of obsessional neurosis are just as painful and tormenting but here the situation is le s perspicuous It is remarkable that the obsessional neurotic in contrast to the melancholiac never takes the step of self destruction he is as if immune against the danger of suicide and is far better protected from it than the hysteric We can see that what guarantees the safety of the ego is the fact that the object has been retained In the obsessional neurosis is has become possible through a regression to the pre genital organization for the love impulses to transform themselves into impulses of aggression against the object Here again the instinct of destruction has been set free and it aims at destroying the object or at least it appears to have this aim These tendencies have not been adopted by the ego it struggles against them with reaction formations and pre cautionary measures and they remain in the id The super-ego however behaves as if the ego were responsible for them and shows by its zeal in chastising these destructive intentions that they are no mere semblance evoked by regression but an actual substitution of hate for love Helpless in either direction the ego defends itself vainly alike against the instigations of the murderous id and against the reproaches of the punishing conscience It succeeds in holding in check at least the most brutal actions of both sides the first outcome

[1] Th s p opo tion is o ly pp tly a p rad It s mply states that h m t ha f gre t ca p c ty both f r good d f e l th it th ks it has e th t is ware of th o gh the c nsc us percep t o s of the g

less by bein, f sed with erotic components in part they are di erted t wards the ext rnal world in the f rm of aggress on while for the most part they und bt dly continue their inner wo k unhindered H w is it then that in melancholia the uper-ego can become a kind of gathe ng-place for the d ath instincts?

From the point f view of morality the co trol and restrictio of in tinct it may be said of t e d that it is totally no moral of the ego th t strives to be moral, and of the super ego that it can be hyper moral and then be comes as ruthl ss as only the id can be It is remarkable that th more a man checks his aggressive tendenci s tow rds thers the more tyra ical, that is agres e he be omes in his ego-ideal. The ordinary ew sees the it a t on the other way round the standard et up by th ego- deal seems t be the moti e for the suppression of ggres e s The fact re mains, h wever a we ha e stated t the m e a man controls his g re eness the more in tense become the aggres ive tendenc es of his ego-ideal against his ego It is like a d pla ment, turning round upo the self B t en rdinary normal morality has a harshly re straining cruelly p ohib ting quality It f m this, indeed that the c ncepti arises of an inexorable h ghe being who metes ut puni h ment

I cannot go further in my consideration f these questions witho t int oducing a fresh assumption. The upe -ego arises as we know from an dentificati n with the f ther regarded as a mod l. E ery such id tification s in the nature of desexualizati n or even of a sub- limati n. It ow seems as tho h when a tran f rmation of this kind takes place th re occurs t th sam time an instin tual d fu on. After sublimation the ti mpo e t no lo ger has the powe to bind the wh le of the destructi e el me ts that we previou ly com bined with t a d these re rel ed in the form f inclinations to aggressi n and destruc tion. This defus on w uld be the sou e of the general character f harshness d cruelty e hi ted by the ideal—its dictat rial Thou shalt.

Let us again consid the b ess al eu- rosis for a moment. The tat of affairs is

now increases its tryanny over the innocent ego It would eem however that in this ca e no less than in that of melancholia, the e o having gained posses ion of the lib do by means of identificat on is punished for do n so by the supe -ego throu h the instrumentality of the aggressiveness wh ch had before been mixed with the lib do

Our ideas about the ego are beginn ng to clear and its various relat onsh ps are ga ning di ti ctness We now see the ego in its strength and in its weaknes es It is entrusted with im portant funct ons By virtue of its relat on to th perceptual syste it arranges the proces es of the m nd in a t mporal order and tests their correspondence w th reality By interposing the process f thinki it secures a postponement of motor discharges and controls the avenues to motility This last office is to be ure a q est o m re of form than of fact in the m tter of action the ego s pos tion is like that of a con t tut onal monarch, without whose sanct no l w can be pa sed but wh hes tates long bef e mpo ing a veto on any mea u e put forward by Parl ament All the experien es of life that originate from without enrich the ego the d howe er is another o ter wo ld to t which it tri es to b ing into subjection to tself It w thdraws l b d from the d and tra forms the object-cathexes of the id nto eg -co stru t ons W th the a d of the uper eg though in a manner that is till obscu e to us it draws upon the expe ces of past ages stored in the d

There are two paths by which the c ntents

importan The ego de el ps from perce in instincts to controlling them from obeying instin ts to cu bing them. In thi achieveme t a large har s taken by the ego- deal whi h indeed is partly a reaction format o ag nst the instinctual proces es in the id Psycho- analysis is an in trume t to enabl the ego to push ts conq est of the id further still

F m the other point of ew however we see this same ego as a poo creature owing serv ce to three masters and consequently menaced by three several dangers from the

external world from the libido of the id and from the severity of the super ego Three kinds of anxiety correspond to these three dangers since anxiety is the expression of a recoil from danger Like the dweller in a borderland that it is the ego tries to mediate between the world and the id to make the id comply with the world s demands and by means of muscular activity to accommodate the world to the id s desires In point of fact it behaves like the physician during treatment by analysis it offers itself to the id as a libidinal object in view of its power of adaptation to the real world and aims at attaching the id s libido to itself It is not only the ally of the id it is also a submissive slave who courts the love of his master Whenever possible it tries to remain on good terms with the id it draws the veil of its *Pcs* rationalizations over the id s *Ucs* demands it pretends that the id is showing obedience to the mandates of reality even when in fact it is remaining obdurate and immovable it throws a disguise over the id s conflicts with reality and if possible over its conflicts with the super ego too Its position midway between the id and reality tempts it only too often to become sycophantic opportunist and false like a politician who sees the truth but wants to keep his place in popular favour

Towards the two classes of instincts the ego s attitude is not impartial Its work of identification and sublimation gives the death instincts in the id assistance in mastering the libido but in so doing it incurs the risk of itself becoming the object of the death instincts and of perishing In order to be able to help in this way it has to become flooded with libido itself it thus becomes the representative of Eros and thence forward desires to live and to be loved

But since the ego s work of sublimation results in a defusion of the instincts and a liberation of the aggressive instincts in the super ego its struggle against the libido exposes it to the danger of maltreatment and death In suffering under the attacks of the super ego or perhaps even succumbing to them the ego is meeting with a fate like that of the protozoa which are destroyed by the products of disintegration that they themselves have created From the economic point of view the morality that functions in the super ego seems to be a similar product of disintegration

Among the subordinate relationships in which the ego stands that to the super-ego is perhaps the most interesting

The ego is the true abode of anxiety Threatened by dangers from three directions it develops the flight reflex by withdrawing its own cathexis from the menacing perception or from the equally dreaded process in the id and discharging it as anxiety This primitive reaction is later replaced by the introduction of protective cathexes (the mechanism of the phobias) What it is that the ego fears either from an external or from a libidinal danger cannot be specified we know that it is in the nature of an overthrow or of extinction but it is not determined by analysis The ego is simply obeying the warning of the pleasure principle. On the other hand we can tell what lies hidden behind the ego s dread of the super-ego its fear of conscience The higher being which later became the ego ideal once threatened the ego with castration and this dread of castration is probably the kernel round which the subsequent fear of conscience has gathered it is this dread that persists as the fear of conscience.

The high sounding phrase Every fear is ultimately the fear of death has hardly any meaning at any rate it cannot be justified. It seems to me on the contrary perfectly correct to distinguish the fear of death from dread of an external object (objective anxiety) and from neurotic libidinal anxiety It presents a difficult problem to psycho analysis for death is an abstract concept with a negative content for which no unconscious correlative can be found. It would seem that the mechanism of the fear of death can only be that the ego relinquishes its narcissistic libidinal cathexis in a very large measure that is that it gives up itself just as it gives up some *external* object in other cases in which it feels anxiety I believe that the fear of death concerns an interplay between the ego and the super ego

We know that the fear of death makes its appearance under two conditions (which moreover are entirely analogous to the other situations in which anxiety develops) namely as a reaction to an external danger and as an internal process as for instance in melancholia. Once again a neurotic manifestation may help us to understand a normal one

The fear of death in melancholia only admits of one explanation that the ego gives itself up because it feels itself hated and persecuted by the super-ego instead of loved To the ego therefore living means the same as being loved —being loved by the super-ego which here again appears as the representative of the id. The super-ego fulfils the same function of pro-

loving and saving that was fulfilled in earlier days by the father and later by Providence or destiny But, when the ego finds itself in over whelming danger of a real order which it believes itself unable to overcome by its own ... s m ro lu

underlay the first great anxiety state of birth and the infantile anxiety of longing for an absent person—the anxiety of separation from the protecting mother

These considerations enable us to conceive of the fear of death, like the fear of conscience as development of the fear of castration The great significance which the sense of guilt has in the neuroses makes it conceivable that ordinary neurotic anxiety is reinforced in severe cases by a development of anxiety between the ego and the super-ego (fear of castration of conscience of death)

The id to which we finally come back has no means of showing the ego either love or hate It cannot say what it wants it has achieved *no unity of will* Eros and the death instinct struggle within it we have seen with what weapons the one group of instincts defends itself against the other It would be possible to picture the id as under the domination of the mute but powerful death instincts which desire to be at peace and (as the pleasure principle demands) to put Eros the intru[der] to rest but that would be to run the r[isk] of valuing too cheaply the part played by Eros.

Inhibitions, Symptoms, and Anxiety

CHAPTER I

In describing pathological phenomena we are enabled by the ordinary usages of speech to distinguish symptoms from inhibitions without however attaching much importance to the distinction Indeed we might hardly think it worthwhile to differentiate more exactly between the two were it not for the fact that we meet with illnesses in which we observe the presence of inhibitions but not of symptoms and are curious to know the reason for this

The two concepts are not upon the same plane Inhibition has a special relation to function It does not necessarily have a pathological implication One can quite well call a normal restriction of a function an inhibition of it A symptom on the other hand actually denotes the presence of some pathological process Thus an inhibition (among other things) may be a symptom In ordinary speech we should use the word *inhibition* when there is a simple lowering of function and *symptom* when a function has undergone some unusual change or when a new phenomenon has arisen out of it Very often it seems to be quite an arbitrary matter whether we emphasize the positive side of a pathological process and call its consequences a *symptom* or its negative side and call them an *inhibition* But all this is really of little interest and the problem as we have stated it does not carry us very far

Since the concept of inhibition is so intimately associated with that of function we may perhaps proceed to examine the various functions of the e o with a view to discovering what forms any disturbance of those functions will assume in each of the different neurotic affections Let us pick out for a comparative study of this kind the sexual function and those of eating of locomotion and of occupational work

(*a*) The sexual function is liable to a great number of disturbances most of which exhibit the characteristics of simple inhibitions These are classed together as *psychical impotence* The normal performance of the sexual function can only come about as the result of a very complicated process and disturbances may appear at any point in it In men the chief points at which inhibition occurs are shown by a turning away of the libido at the very beginning of the process (psychological unpleasure) an abridgment of the sexual act *(ejaculatio praecox)* an occurrence which might equally well be regarded as a symptom an arrest of the act before it has reached its natural conclusion (absence of ejaculation) or a non appearance of the psychological results (lack of pleasure in orgasm) Other disturbances arise from the sexual function becoming dependent on spec conditions of a perverse or fetishistic nature

That there is a relationship between inhib tion and anxiety is pretty evident Man inhibitions obviously represent a relinquish ment of a function whose exercise would pro duce anxiety Many women are openly afraid of the sexual function We class this anxiety under hysteria just as we do the defensive symptom of disgust which arising originally as a deferred reaction to the experiencing of a passive sexual act appears later whenever the *idea* of such an act is presented Furthermore many obsessional acts turn out to be measures of precaution and security against sexual ex periences and are thus of a phobic character

This is not very illuminating We can only note that disturbances of the sexual function are brought about by a great variety of means (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple) (2) the function may be less well carried out (3) it may be hampered by having conditions attached to it or modified by being diverted to other aims (4) it may be prevented by measures of security (5) if it cannot be pre vented from starting it may be immediately interrupted by the appearance of anxiety and (6) if it is nevertheless carried out there may be a subsequent reaction of protest against it and an attempt to undo what has been done

(*b*) The function of nutrition is most fre quently disturbed by a disinclination to eat brought about by a withdrawal of libido An

Th gh t th w k l l t h bee t l ted by th t t d w d pl wh l reserv g p f the G m S hmerz—Tr.

increase in the desire to eat is also a not uncommon thing. The compulsion to eat is attributed to a fear of starving but this is a subject which has been but little studied. The hysterical defence against eating is known to us in the symptom of vomiting. Refusal to eat owing to anxiety is a concomitant of psychotic states (delusions of being poisoned)

(c) In many neurotic conditions locomotion is inhibited by a disinclination to walk or a weakness in walking. In hysteria, there will be a paralysis of the motor apparatus or this one special function of the apparatus will be abolished (abasia). Especially characteristic are the increased difficulties that appear in locomotion owing to the introduction of certain stipulations whose non-observance results in anxiety (phobia)

(d) In inhibition in work—a thing which we so often have to deal with as an isolated symptom in our therapeutic work—the subject feels a decrease in his pleasure in it or becomes less able to do it well or he has certain reactions to it, like fatigue giddiness or sickness if he is obliged to go on with it. If he is a hysteric he will have to give up his work, owing to the appearance of organic and functional impairments of activity which make it impossible for him to carry it on. If he is an obsessional neurotic, he will be perpetually being distracted from his work or losing time over it owing to delays and repetitions.

Our survey might be extended to other functions of the ego as well but there would be nothing more to be learned by doing so for we should not penetrate below the surface of the phenomena presented to us. Let us then proceed to describe inhibition in such a way as to leave very little doubt about what is meant by it and say that inhibition is the expression of a restriction of an ego-function.

A restriction of this kind can itself have very different causes. Many of the mechanisms involved in the renunciation of function are well known to us as is a certain general purpose which runs through it. This purpose is more easily recognizable in the specific inhibitions. Analysis shows that when activities like playing the piano writing or even walking, undergo neurotic inhibitions, it is because the physical organs brought into play—the fingers or the feet—have become too strongly eroticized. It has been discovered as a general fact that the ego-function of an organ is impaired if its erotogenicity—its sexual significance—is increased. If I may be allowed a somewhat vulgar analogy like a maid servant who refuses to go on cooking because her master has started a love affair with her. As soon as writing which entails making a liquid substance flow on to a piece of white paper assumes the significance of copulation, or as soon as walking becomes a symbolic substitute for treading upon the body of mother earth, both writing and walking are stopped because they represent the performance of a forbidden sexual act. The ego renounces these functions which are within its sphere, in order not to have to undertake fresh measures of repression—in order to avoid coming into conflict with the id.

There are clearly also inhibitions which serve the purpose of self punishment. This is often the case in inhibitions of occupational activities. The ego is not allowed to carry on those activities because they would bring success and gain and these are things which the severe super-ego has forbidden. So the ego gives them up too in order to avoid coming into conflict with the super-ego

The more generalized inhibitions of the ego obey a different mechanism of a simple kind. When the ego is faced with a particularly difficult mental task, as occurs in mourning or when there is some tremendous suppression of affect or when a continual flood of sexual *phantasies is being kept down it loses so much* of the energy at its disposal that it has to cut down the expenditure of it at many points at once. It is in the position of a speculator whose money has become tied up in various enterprises. I came across an instructive example of this kind of intense though short-lived, general inhibition. The patient, an obsessional neurotic used to be overcome by a paralysing fatigue which lasted for one or more days whenever something occurred which should obviously have thrown him into a rage. We have here a point of departure from which we may hope to reach an understanding of the condition of general inhibition which characterizes states of depression, including the gravest form of them melancholia.

As regards inhibitions then we may say in conclusion that they are restrictions of the functions of the ego which have either been imposed as a measure of precaution or brought about as a result of an impoverishment of energy and we can see without difficulty in what respect an inhibition differs from a symptom for a symptom cannot be described as a process that takes place within or acts upon the ego.

CHAPTER II

THE main characteristics of the formation of symptoms have long since been studied and I hope established beyond dispute A symptom is a sign of and a substitute for an instinctual gratification which has remained in abeyance it is a consequence of the process of repression Repression proceeds from the ego when the latter—it may be at the b hest of the super ego —refuses to associate itself with an instinctual cathexis which has been aroused in the id The e o is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious Analysis shows that the idea often persists as an unconscious formation

So far everything seems clear but we soon come upon difficulties which have not as yet been solved Up till now our account of what occurs in repression has laid great stress on this point of exclusion from consciousness But it has left other points open to uncertainty One question that arose was what happened to the instinctual impulse which had been actuated in the id and which sought to be gratified? The answer was an indirect one It was that owing to the process of repression the pleasure that would have been expected from gratification had been transformed into unpleasure But we were then faced with the problem of how the gratification of an instinct could produce unpleasure The whole matter can be clarified I think if we commit ourselves to the definite statement that as a result of repression the intended course of the excitatory process in the id does not occur at all the ego succeeds in inhibiting or deflecting it If this is so the problem of *transformation of affect under repression* disappears At the same time this view implies that the ego can exert a very extensive influence over processes in the id and we shall have to find out in what way it is able to develop such astonishing powers

It seems to me that the ego obtains this influence in virtue of its intimate connections with the perceptual system—connections which as we know constitute its essence and provide the basis of its differentiation from the id In its function the perceptual system which we have called *Pcpt Cs* is bound up with the phenomenon of consciousness It receives excitations not only from outside but from within and endeavours by means of the pleasure unpleasure sensations which reach it from these directions to direct the course of every mental event in accordance with the pleasure principle We are very apt to think of the ego as powerless a ainst the id but when it is opposed to an instinctual process it has only to give a *signal of unpleasure* in order to attain its object with the aid of that almost omnipotent institution the pleasure principle To take this situation by itself for a moment we can illustrate it by an example from another field Let us imagine a country in which a certain small faction objects to a proposed measure the passa e of which would have the support of the masses This minority obtains command of the press and by its help manipulates the supreme arbiter *public opinion* and so succeeds in preventing the measure from being passed

But this explanation opens up fresh problems Whence does the energy come which is employed for giving the signal of unpleasure? Here we may be assisted by the idea that a defence against an unwelcome *internal* proce s will be modelled upon the defence adopted against an *external* stimulus that the ego wards off internal and external dan ers alike along identical lines In the case of external danger the organism has recourse to attempts at flight. The first thing it does is to withdraw cathexis from the perception of the dangerous object later on it discovers that it is a better plan to perform muscular movements of such a sort as will render perception of the dangerous object impossible even in the absence of any refusal to perceive it—that it is a better plan that is to remove it elf from the sphere of danger Repression is an equivalent of this attempt at flight The e o withdraws its (preconscious) cathexis from the psychical representative of the impulse that is to be repressed *and uses that cathexis for the purpo e of releasing unpleasure (anxiety)* The problem of how anxiety arises in connection with repression may be no simple one but we may legitimately maintain the opinion that the ego is the actual seat of anxiety and give up our earlier view that the cathectic energy of a repressed impulse is automatically turned into anxiety If I expressed myself in the latter sense on former occasions I was giving a phenomenolo ical description and not a metapsychological explanation of what was occurring

This brings us to a further question how is it possible from an economic point of view for a mere process of withdrawal and discharge like the withdrawing of a pre conscious ego-cathexis to produce unpleasure or anxiety seeing that according to our assumptions unpleasure and anxiety can only arise as a result

experience of anxiety has gi en the affect of anxiety certain ch racteristic forms of exp es sion But, while cknowledgi g th s conne t on we must t lay und e tress n it nor o er look th fact that b logical necess ty demands that a situat of da ge should ha e an affec u e symbol, o that a symbol of this k d would ha to be cre ted n ny ca More ov r I d t think that we are justified in assuming that wh ever there s an o tbreak of anxiety om thing like a repr duct on of the situati f b rth goes on in th mind It is not even certain whether hyst rical attacks though they w e rinnally tra mati reprodu t on of this sort, permanently etain that character

As I h e h wn els wher m t of the repress ns th which we h t deal in ur therapeuti w k a e ca f aft r-expuls n They presuppose th perat on of ea h pri mal epress ns whi h ex rt an ttract on on th more recent t at o Far too littl is known a yet abo t th backgr und a d pre liminary st ge of rep essi n Th re a danger of ov -estim ting the part pl y d in r pre s on by the upe -ego We cannot at present say f m ts c wheth t is th m g e of th supe -ego which pr des th lme of d ma t between primal repress and fte -expuls on At any rate th ea li st o t breaks of anxiety which are of a ery inten kind occu before the supe -ego has b om differentiated It is highly p obable that the prec p t ting causes f primal repress quantitati f ctors h an ex ess e d gree of excitatio and the breaking throu h f th protecti barrier gainst t m l

Th ment on f the prot ti e barrier sounds a note which recalls to us the fact that repres s ons occur in two d fferent s tuations namely when an undesirable in ti ctual impul e is aroused by some external perception and when it arises internally without any such pro oca tion We hall return to this d fference pres ently But the protecti e barrier *only ex ts in* regard to external st mul not in regard to internal i stinctual demands

So l ng as we direct our atte tion to the ego s attempt at flight we hall get no nearer to the subject of *symptom format on* A symp tom arises from an i stinctual impulse which has been prejudic ally affected by repress o If the ego by making use of the ignal of unpleasure attains its object of completely *suppre sing the inst nctual impulse* we learn noth ng of how this has happened We can o ly find o t about it from those cases in which repress on has to a greater or less extent failed In this eve t the pos tio generally speaking is that the in tinctu l impulse has found a substitute in spite of repress on but a substi tute which is very much reduced di placed, and inhib ted and which is no lo ger recog nizable as a gratificat on And when the im p l e is carried out there is no sensati n of pleas e its carry g out has instead the *quality of a c mpuls on*

In thu deg ading a gratificatory process to a symptom repression displays its power in a further respect The sub t tuti e proce s is pre ent d if pos ble from finding discharge through m tility and even if this cannot be d ne the p ocess is f ed to expend itself in maki g alt ration in the subject s own body a d is not permitted to mping up n th outer world. It may not be transformed i to act on For as we know i repressio the ego is oper ating under the influe ce of external reality and theref re t d bars the *substitutive* process from havi g any effect upon that real ty

Ju t as th ego c t ls th path t act on in regard to th o ter w ld so t controls c ess to co ci u nes In rep ession t d splays its pow r in both d rect ns acting in th o e mann upon th stinct al mpuls itself and in the th upon the p ychical representat ve of th t mpulse At this point t is lev nt to ask h w I c n reconcile this ackn wledgment of the might f the ego with the descript n f t pos t on which I g e in *The Eg nd the Id* In that book I d ew a p ct re of ts d pe d e c upo the d and upon the supe -eg wh ch rev led how p we less d pprehens e it was in regard t both and with what an effort

it maintained its superiority over them This view has been widely echoed in psycho analytic literature A great deal of stress has been laid on the weakness of the ego in relation to the id and of our rational elements in the face of the demonic forces within us and there is a strong tendency to make what I have said into a foundation stone of a psycho analytic *Weltanschauung* Yet surely the psycho analyst with his knowledge of the way in which repression works should of all people be restrained from adopting such extreme and one sided views

I must confess that I am not at all partial to the fabrication of *Weltanschauungen* Such activities may be left to philosophers who avowedly find it impossible to make their journey through life without a Baedeker of that kind to tell them all about everything Let us humbly accept the contempt with which they look down on us from the vantage ground of their superior needs But since we too cannot forego our narcissistic pride we will draw comfort from the reflection that such Guides to Life soon grow out of date and that it is precisely short sighted narrow and finicky work like ours which obliges them to appear in new editions and that even the most up to date of them are nothing but attempts to find a substitute for the ancient useful and all embracing catechism We know well enough how little light science has so far been able to throw on the problems that surround us But however much ado the philosophers may make they cannot alter the situation Only patient persevering research in which everything is subordinated to the one requirement of certainty can gradually bring about a change The benighted traveller may sing aloud in the dark to deny his own fears but for all that he will not see an inch further beyond his nose

CHAPTER III

To return to this problem about the ego The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in reality a complicated state of affairs We were justified I think in dividing the ego from the id for there were certain considerations which necessitated that step On the other hand the ego is identical with the id and is merely a specially differentiated part of it If we regard this part by itself in contradistinction to the whole or if a real split has occurred between the two the weakness of the ego becomes apparent But if the ego remains bound up with the id and indistinguishable from it then it displays its power The same is true of the relation between the ego and the super ego In many situations the two are merged and as a rule we can only distinguish one from the other when there is a tension or conflict between them In repression the decisive fact is that the ego is an organization and the id is not The ego is indeed the organized portion of the id We should be quite wrong in picturing the ego and the id as two opposing camps and in thinking that when the ego tries to suppress a part of the id by means of repression the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego This may often be what happens but it is not the primary situation in repression As a rule the instinctual impulse which is to be repressed remains isolated Although the act of repression demonstrates the strength of the ego in one particular it reveals the ego s powerlessness and reveals too how impervious to influence are the separate instinctual impulses of the id For the mental process which has been turned into a symptom owing to repression maintains its existence outside the organization of the ego and independently of it Indeed it is not the process alone but all [illegible]
the priv [illegible]
ever the [illegible]
part of t[illegible] go organization it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego Long ago I compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was imbedded It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom As far as can be seen this is most often possible in hysterical conversions But usually the outcome is different The initial act of repression is followed by tedious and often interminable manoeuvres in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom

In this secondary defensive struggle the ego faces two ways The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation The ego is an organization It is based upon the maintenance of free intercourse and of

the possibility of reciprocal influ ce between all its parts. Its d sexualized energy still hows traces of its origin in its tendency to bind together and unify and this necessity t syn thesis grows stronger in proportion as the strength of the ego increases It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and f reign by using every pos ble method to bind them to itself in one way or another and to incor porate them in its organization by means of those bonds As we know a te dency of this kind is already operative in the very act of forming a sympt m. A classical instance of this are those hysterical symptoms which have been shown to be comp omise between the need for gratification and the need for punishment. S ch symp ms participate in the ego from the very beginnin ince they fulfil a equirement of the super-ego whil o the oth hand they represent positions occupied by th repressed and points t wh h an irrupt on has been made by it into the ego-organization. The are a kind of front er pos tion with a mixed cathexis (Whether all primary h st rical symptoms are constructed on these lines would be worth en quiring int very carefully) The eg now proceeds t beha e as *though it recognized that* the sympt m had come t stay and that the only thing to d was t cept the ituat n in good part and draw a much dvantage from it as possible It makes an dapt ti n t the symptom—to th piec f th internal w ld which is alien t t—just as t rmally does to the bject e ext rnal wo ld. It can always find plenty f opportunities for doing so The presence f a ymptom m entail a certain impairment f the capacities f th indi dual, and this can be expl ted to ppease ome de mand on th part f the super-ego o t refuse some requirement coming from the ext rnal w ld. In this way the symptom gradually grows t be the representati f importa t in erest it is found t be useful f th main tenance of t elf and becomes m e and more closely merged with the e and mor and more indispensable to t It is onl ery rarely that the ph s cal proces f *h a ing* round a foreign body f llows such ourse as this Th re is a danger too f exaggerating the importance f secondary daptation f this kind to a symptom and of sa ing that the ego has crea ed th sympt m merely in rde t enj s dvan tages. It would be equally true to sa that a man who had lost his leg in the war had got t shot away so that he might thenceforward live on his pension without havin to work any more

In obsessional neurosis and paranoia the forms which the symptoms assume become very aluable to the ego because they obtain for it not certain advantages but a narcissistic gratification which it would otherwise forgo The symptoms which the obsess onal neurotic constructs flatter his self-esteem by making him feel that he is better than others because he is specially cleanly or specially conscient ous. The delusional constructions of the paranoiac offer to his acute perceptive and imaginati e powers a field of acti ty which he could not easily find elsewhere

All of this results in what s known as the *epinosic gain* of a eurosis. This epi osic gain comes to th a tance of the ego in its en dea our to incorporate the symptom and in creases the fixation of the latter When the analyst tries to h lp the ego in its struggle against the symptom, he finds that these rec o ciliatory bo ds between ego and symptom operat on the side of the resistances and that they are not easy to loosen.

The two lines of beha our which th ego d pts towards the symptom are in fact di rectl opposed to each other For the other lin is less friendly in character since it con tin es in the direction of repress on. Neverthe less the ego t ppears cannot be accused of inconsistency Being of a peaceable dispos tion t would like to incorporat the symptom in its framewo k. It is from th symptom itself that th troubl comes F r the symptom being the tru substitute and derivative of the repressed impulse carries o the role of the latter it continually renews its demands fo gratification and thus b inces the ego in its turn to give the ignal f unpleasure and put itself in a posture of defence

The seco dary defen e struggle against the sympt m is man -s ded. It is f ught out on many fields and makes use of multitude of means We shall n t be abl to say m ch bout it until we ha e mad an enquiry int indi du al cases f symptom f rmation. In d in this we hall ha e an opportunity f going into th p oblem f anxiety—a prob em which has long been loomin in th background. The wisest plan will be I think, t tart f om the symptoms prod ced by the hysterical neuroses for w are t as yet in a po t t consider the co ditions in which th symptoms f obsessional neurosis paran ia, and other neuroses are formed.

it maintained its superiority over them This view has been widely echoed in psycho analytic literature A great deal of stress has been laid on the weakness of the ego in relation to the id and of our rational elements in the face of the demonic forces within us and there is a strong tendency to make what I have said into a foundation stone of a psycho analytic *Weltanschauung* Yet surely the psycho analyst with his knowledge of the way in which repression works should of all people be restrained from adopting such extreme and one sided views

I must confess that I am not at all partial to the fabrication of *Weltanschauungen* Such activities may be left to philosophers who avowedly find it impossible to make their journey through life without a Baedeker of that kind to tell them all about everything Let us humbly accept the contempt with which they look down on us from the vantage ground of their superior needs But since we too cannot forego our narcissistic pride we will draw comfort from the reflection that such Guides to Life soon grow out of date and that it is precisely short sighted narrow and finicky work like ours which obliges them to appear in new editions and that even the most up to date of them are nothing but attempts to find a substitute for the ancient useful and all embracing catechism We know well enough how little light science has so far been able to throw on the problems that surround us But however much ado the philosophers may make they cannot alter the situation Only patient persevering research in which everything is subordinated to the one requirement of certainty can gradually bring about a change The benighted traveller may sing aloud in the dark to deny his own fears but for all that he will not see an inch further beyond his nose

CHAPTER III

To return to this problem about the ego The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in reality a complicated state of affairs We were justified I think in dividing the ego from the id for there were certain considerations which necessitated that step On the other hand the ego is identical with the id and is merely a specially differentiated part of it If we regard this part by itself in contradistinction to the whole or if a real split has occurred between the two the weakness of the ego becomes apparent But if the ego remains bound up with the id and indistinguishable from it then it displays its power The same is true of the relation between the ego and the super ego In many situations the two are merged and as a rule we can only distinguish one from the other when there is a tension or conflict between them In repression the decisive fact is that the ego is an organization and the id is not The ego is indeed the organized portion of the id We should be quite wrong in picturing the ego and the id as two opposing camps and in thinking that when the ego tries to suppress a part of the id by means of repression the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego This may often be what happens but it is not the primary situation in repression As a rule the instinctual impulse which is to be repressed remains isolated Although the act of repression demonstrates the strength of the ego in one particular it reveals the ego s powerlessness and reveals too how impervious to influence are the separate instinctual impulses of the id For the mental process which has been turned into a symptom owing to repression maintains its existence outside the organization of the ego and independently of it Indeed it is not the process alone but all its derivatives which enjoy as it were the privilege of extra territoriality and whenever they come into associative contact with a part of the ego organization it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego Long ago I compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was imbedded It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom As far as can be seen this is most often possible in hysterical conversions But usually the outcome is different The initial act of repression is followed by tedious and often interminable manoeuvres in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom

In this secondary defensive struggle the ego faces two ways The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization It is based upon the maintenance of free intercourse and of

with his mother had shown fear of his father we should have no right to say that he had a neurosis o a phobia. His emotional reaction would have bee entirely comprehensible What made it a neurosis was one thing alone the replacement of his f ther by a horse It is this displacemen then, which has a claim to be called a symptom and which, incidentall constitutes the alternative mechanism which ena bles a conflict d to amb ale ce to be resolved without the aid of a reaction formation.

Such a displacement is made possible r facili t ed t Little Hans s early age because the inborn traces of to m tic thought can stil be easily revived. Children d not as yet recognize or a a re lay such exaggerated tress upon the gulf tha separa es human beings from the animal world. In their eyes the grown man, the object of th ir fea and admiration still be ongs t the same category as the big animal who has o many en iable ttributes but against w om they ha e been warned because he may become dan erous. As we see the conflict of ambivalence is not dealt with in relation t one and the same person t is cir cumvented, as t were by o of the pair of conflicting impulses being directed to a vicari ous figure.

So f r everything is lear But the analysis of Little Hans s phobia has been very disappointing in one respect. The di rtion which constituted the symptom forma n was not applied to the psychical representative (the ideational content) f th instinctual impulse tha was to be repressed i was pplied to a quit different representative and one which onl c rresponded to ction to the disagreeable instinct It would be more in ord ance with our expectations if Little Hans had developed, instead f fear of h rses an i clination t ill treat them and to bea them or if he had expressed in strong terms a wish t see them fall down t be hurt even di in ... ("mak row with thei feet") Something of th sort did in f ct emerge in his analysis b was ot by any means in the f refront f his euros s. And, curiously enough, f he really had produced nimosity f this sort not against his f th but against horses his main symp om we hould not ha e said that h was suffering f m a eurosis There must be someth amiss he with our view of repres on or with our definition of symptom. On thing trikes us t once if Little Hans had really beha ed in such a w y to horses it would mean that repression had in no way al ered the character of his object on able and aggressive impulses them lves but only the object against which they were directed.

Undoubtedly there are cases in which this is all that repression does *But more than this has* happened in the development of Little Hans s phobia—how much more can be guessed from another analysis.

As we know Little Hans alleged tha what he wa afraid of was that a horse would b e him. Now sometime la r I was able to learn som thing about the origin of ano her animal pho a. I this instance the dreaded animal was a wolf it too had the sign ficance of a father substitute As a boy the patient in ques on—a Russian whom I did not anal se until he had reached his thirties—had had a dream (whose meaning was revealed in analy

had developed a

he seven

case of

Little Hans th ascertained fact that his father used to play at horses with him doubtles determined his cho ce of a horse as his anxiet animal. In th same way it ppeared at least highl probabl that th f ther of m Russian patient used when playing with him to pretend to be a w lf and joki gly threaten to ea him up. Since then I have come across third instanc The patie t was a young American wh came to me f r treatment. True he had not

gingerbread man so s to t him up He den tified himself with this edible person and the Arab ch f was ea ly recognizabl as a fa her substitute This phantasy form d the sub tra um f his auto-erotic phanta es.

Yet in sp e f that su h an idea is so strange t us that we can hardl credit its existenc in child N d w know wheth t reall means what t eems to and we cannot und r and how t can ha e become the ubject matter f phobia. Analyt bservation supplies the requi t inf rmation. It hows that the dea f being eaten by the f ther gi es

Freud, From the History f an Infantile Neurosis" (5) *Collected P* ... III.

CHAPTER IV

LET us take as our first example an infantile hysterical phobia of animals We will select the case of Little Hans whose phobia of horses was undoubtedly typical in all its main features The first thing that is apparent is that in a concrete case of neurotic illness the state of affairs is much more complex than one would suppose so long as one was dealing with abstractions It takes some time to orientate oneself and to decide which the repressed impulse is wh [illegible] found and [illegible]

Little H[illegible] e street because he was afraid of horses This is the raw material of the case Which part of it constitutes the symptoms? Is it his having the fear? Is it his choice of an object for his fear? Is it his giving up his freedom of movement? Or is it several of these combined? What is the gratification which he renounces? And why does he have to renounce it?

At a first glance one is tempted to reply that the case is not so very obscure Little Hans s unaccountable fear of horses is the symptom and his inability to go out into the streets is an inhibition a restriction which his ego has imposed on it elf so as not to arouse the anxiety symptom The second point is clearly correct and in the discussion which follows I shall not concern myself any further with this inhibition As regards what was presumably the symptom a superficial acquaintance with the case does not even disclose its true formulation For further investigation shows that what he was suffering from was not a vague fear of horses but a quite definite apprehension that a horse was going to bite him This idea indeed was endeavouring to withdraw from consciousness and get itself replaced by an undefined phobia in which only the anxiety and its object still appeared Was it perhaps this idea which was the nucleus of his symptom?

We shall not make any headway until we have reviewed the little boy s psychological situation as a whole as it came to light in the course of analytic treatment He was at that time in the Oedipus position with its attendant feelings of jealousy and hostility towards his father whom nevertheless—except in so far as his mother was the cause of estrangement—he dearly loved Here then we have a conflict due to ambivalence a firmly rooted love and a no less well grounded hatred directed against one and the same person Little Hans s phobia must be an attempt to solve this conflict. Conflicts of this kind due to ambivalence are very frequent and they can have another typical outcome in which one of the two conflicting feelings (usually that of affection) becomes enormously enhanced and the other vanishes. Only the exaggerated degree and compulsive character of the feeling that remains betray the fact that it is not the sole one in existence but is continually on the alert to keep the opposite feeling under suppression and enables us to postulate the operation of a process which we call *repression by means of reaction formation* (in the ego) Cases like Little Hans s show no traces of a reaction formation of this kind There are clearly different ways of egress from a conflict of ambivalence

Meanwhile we have been able to establish another point with certainty The instinctual impulse which underwent repression in Little Hans was a hostile one against his father Proof of this was obtained in his analysis while the idea of the biting horse was being followed up. Hans had seen a horse fall down and he had also seen a playmate with whom he was playing at horses fall down and hurt him elf Analysis justified the inference that he had a conative impulse that his father should fall down and hurt himself as his playmate and the horse had done Moreover his attitude towards someone s departure on a certain occasion makes it probable that his wish that his father should be out of the way found a less hesitating expression But a wish of this sort is tantamount to an intention of putting the father out of the way oneself—is tantamount that is to the murderous impulse which is one component of the Oedipus complex.

So far there seem to be no connecting links between Little Hans s repressed instinctual impulse and the substitute for it which we suspect is to be seen in his phobia of horses Let us simplify his psychological situation by setting on one side the elements of infancy and ambivalence Let us imagine that he is a young servant who is in love with the mistress of the house and has received ome tokens of her favour He hates his master who is more powerful than he and he would like to have him out of the way It would then be eminently natural for him to be afraid of his master and to dread his vengeance—just as Little Hans was frightened of horses We cannot therefore describe the anxiety belonging to this phobia as a symptom If Little Hans being in love

[1] F e d A alysi of a Ph bi i a F e Yea -Old Boy' (1909) *Collected P pers* III

feminine side was strongly developed. The analysis of his wolf-dream revealed very little intentional aggressiveness towards his father but it brought forward unmistakabl proof that his passive tender attitude to his father had been overtaken by repression. In his case too the other factors may have been operative as well but they were not visible. How is it that, whereas these differences between the two cases almost amount to an antithesis, the final outcome—a phobia—was approximately the same? The answer must be sought in another quarter I think it will be found in the second fact which emerges from our brief comparative examination. It seems to me that in both cases we can detect what the motive force of the repression was and can substantiate our view of its nature from the line of development which the two children subsequently pursued. This motive force was identical in both. It was the fear of impending castration. Little Hans gave up his aggressiveness towards his father from fear of being castrated. His fear that a horse would bite him can easily be extended into meaning a fear that a horse would bite off his genitals, would castrate him. But it was from fear of being castrated, too that the little Russian relinquished his desire to be loved by his father for he thought that a relation of that sort presupposed a sacrifice of his genitals—of the organ which distinguished him from women. As we see both forms of the Oedipus complex, the normal, active form and the inverted one are broken down by the castration complex. The Russian boy's anxiety idea of being eaten up by a wolf contained, it is true, no suggestion of castration, for the oral regression it had undergone had removed it too far from the phallic stage. But the analysis of his dream rendered further proof superfluous. It was a triumph of repression that the form in which his phobia was expressed should no longer have contained any allusion to castration.

So now we have made the unexpected discovery that in both patients the motive force of the repression was fear of castration. The ideational content of their anxiety—being bitten by a horse and being eaten up by a wolf—was a substitute by distortion for the idea of being castrated by the father. It was this idea which had undergone repression. In the Russian boy the idea was an expression of a desire which was not able to subsist in the face of his masculine revolt; in Little Hans it was the expression of a reaction in him which had turned his aggressiveness into its opposite. But the *affect* of anxiety which was the essence of their phobia, came not from the process of repression, not from the libidinal catheses of the repressed impulses but from the repressing agency itself. The anxiety belonging to the animal phobias was an untransformed fear of castration. It was therefore an objective fear a fear of a danger which actually was imminent or believed to be so. It was anxiety which produced repression and not, as I formerly believed, repression which produced anxiety.

I cannot deny the fact, though it is not pleasant to recall it that I have on many occasions asserted that in repression the psychical representative of the instinct is distorted, displaced, etc., while the libido belonging to the instinctual impulse is transformed into anxiety. But now an examination of phobias which should be best able to provide confirmatory evidence fails to bear out my assertion. The anxiety felt in animal phobias is the castration anxiety of the ego while the anxiety felt in agoraphobia (a subject that has been less thoroughly studied) seems to be a fear of incurring sexual temptation—a fear which, after all, must be connected in its origins with the fear of castration. As far as can be seen at present, the majority of phobias go back to an anxiety of this kind felt by the ego in regard to the demands of the libido. It is always the ego's attitude of anxiety which is the primary thing and which sets repression going. Anxiety never arises from repressed libido. If I had formerly been content to say that after the occurrence of repression there appeared, in place of the manifestation of libido that was to be expected, a certain amount of anxiety I should have nothing to retract today. The description would be correct and there does undoubtedly exist a correspondence of the kind asserted between the strength of the impulse that has to be repressed and the intensity of the resultant anxiety. But I must admit that I thought I was giving more than a mere description. I believed I had put my finger on a metapsychological process of direct transformation of libido into anxiety. I can now no longer maintain this view. And, indeed, I found it impossible at the time to explain how a transformation of that kind was carried out.

It may be asked how I arrived at this idea of transformation in the first instance. It was while I was studying the actual neuroses at a time when analysis was still a very long way from distinguishing between processes in the

expression in a form that has undergone regressive degradation to a passive tender impulse to be loved by him in a genital-erotic way

Further research into the case history of the Wolf Man leaves no doubt of the correctness of this explanation The genital impulse it is true betrays no sign of its tender inclination when it is expressed in the language belonging to that transition phase between the oral and sadistic organization of the libido which has been left behind Besides is it merely a question of the replacement of a particular psychical representative by a re ressive form of expression or is it a question of the genuine regressive degradation of a genitally orientated impulse in the id? It is not at all easy to make certain The case history of the Wolf Man gives very definite support to the second more serious view for from the time of the decisive dream onward the boy became naughty tormenting and sadistic and soon after developed a regular obsessional neurosis At any rate we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome instinctual impulse If it succeeds in making an instinct regress it will actually have done it much more injury than it could have by repressing it Sometimes indeed after forcing an instinct to regress in this way

The case (

less complic raise a number of further considerations But we already learn two unexpected facts There can be no doubt that the instinctual impulse which was repressed in both phobias was a hostile one against the father One mi ht say that that impulse had been repressed by being reversed Instead of aggressiveness *towards* the father there appeared aggressiveness *from* the father in the shape of revenge Since this aggressiveness is in any case rooted in the sadistic phase of the libido a certain degree of degradation of it is all that is needed to reduce it to the oral stage This stage while only adumbrated in Little Hans s fear of being bitten was blatantly exhibited in the Wolf Man s terror of being devoured But besides this the analysis has demonstrated beyond a shadow of a doubt the presence of another instinctual impulse of an opposite nature which had succumbed to repression This was a loving passive impulse directed towards the father which had already attained the genital (phallic) level of libidinal organization As regards the final outcome of the process of repression this impulse eems, indeed to have been the more important of the two it underwent a more far reaching regression and had a decisive influence upon the content of the phobia In following up a single current of instinctual repression we have thus come upon a confluence of two The two instinctual impulses that have been overtaken by repression—sadistic aggressiveness towards the father and passive affection for him—form a pair of opposites Furthermore a full comprehension of Little Hans s case shows that the formation of his phobia had had the effect of abolishing his affectionate object cathexis of his mother as well though the actual content of his phobia betrayed no sign of it The process of repression had attacked almost all the components of his Oedipus complex—both his hostile and his tender impulses toward his father and his tender impulses toward his mother In my Russian patient this state of affairs was much less patent

These are unwelcome complications considering that we only set out to study simple cases of symptom formation and with that intention selected the earliest and to all appearances most transparent neuroses of childhood Instead of a single repression we have found a collection of them and have become involved with regression into the bargain Perhaps we have added to the confusion by treating the two cases of animal phobia at our disposal—Little Hans and the Wolf Man—as thou h they were cast in the same mould As a matter of fact certain differences between them stand out It is only with regard to Little Hans that we can positively assert that what his phobia disposed of were the two main impulses of the Oedipus complex viz his aggressiveness towards his father and his over fondness for his mother A tender feeling for his father was undoubtedly there too and played a part in repressing the opposite feeling but we can prove neither that it was strong enough to draw repression upon itself nor that it subsided after his phobia appeared Hans seems in fact to have been a normal boy with what is called a *positive* Oedipus complex It is possible that those factors which seem not to have been present were actually at work in him but we cannot demonstrate their existence Even the most exhaustive analysis has gaps in its data and is insufficiently documented In the ca e of the Wolf Man something different is lacking His attitude to female objects had been disturbed by an early seduction and his passive

conversion hysteria should be such a pecul ly obscure thing I d not know but the fact provides us with good reason for qu tting such an unproducti e field of enquiry

Let us turn to the obses ional neuroses in the hope of learning more about the format on f symptoms. The symptoms belo ging to this neurosis fall in ge eral nto two groups e ch ha ing an opposit bias They a e e ther prohib tions, precautions and expi t ns—that is negative in characte —or they are substituti e gratifications often ppearing in symb lic dis guise The negati e defen ive gr up of symptoms is the mo e primary f the tw but as the illness is pr longed the grat ficatory group overriding all defensi e m a ures gains the upper hand Th symptom format on cores a triumph f t ceeds n c mbining the tw by jo ning to what was originally a d fen command o prohib ti the significa ce of a gratificat o and in rd r to ch eve this end it will often make u e of the m t in enious associati e paths S ch an chievement dem n strates the tendency of the ego t synth tiza tion which t ha alread been seen to possess

n one knows why plays s ch la ge part in bsessional neuroses In the crudest instan e the symptom has two phases an a t n which carries out rtain inju ction s mmedi tely succeeded by an th tion which stops or undoes th first eve f it does not go quite so f r as to carry t its oppos te

Tw impressions t on e em rg f m this brief urvey of bsessional sympt ms The first is that a ceaseless stru gle being wag d gainst the repressed n whi h the repre g force steadily lose ground the se ond is that the ego and the super-eg ha e a speciall larg share in the f rmation f th symptoms

Obses nal urosis is unquesti bly the most int esting and repay ng subject of an lyti resea h. But as a pr blem t has not yet been ma t red It must be fess d that f w endea our t pen trat m re deeply int ts nat we still ha t ely upon do btful assumpti ns and un firmed suppositio Obses onal ne osis riginate n doubt in the sam tuation a hysteri nam ly th ty f w ding ff the lib dinal d ma d f th Oedipus mplex. I deed every b ss nal neurosi seems to ha e substrat m f hys terical symptoms that ha e bee f rmed t a very early stage But it is subseque along qu te d fferent lines owi g to tional f ctor The genital organizati l'b d turns out to be weak and insu res stant so that when the ego begins f ns e actions the first thing it succeeds in doing is to throw back in part or altogether the genital organizat on (of the phallic phase) on to the earlier sadistic-anal level This phe n menon of regression is dec si e for all that follows

Another pos b'lity has to be considered. P rhaps regres o is the re ult not of a con *stitut onal f ctor* but of a time factor It may be that regress o is rendered poss ble not be cau e the genital organizatio of the libido is too weak but becau e the oppo tion of th ego begins too early while the sadistic phase is at ts height I am not prepared *to* *expre s* an ab olut op nion on thi point but I may say that analytic observation does not speak in fav ur of such an assumpt on. It rather tends to how that by the time an obses onal neurosis begins to show tself the phallic stage has al ready been attained Moreover the onset of this ne rosis belo gs to later t me of life than that of hysteria It sets i in the econd period of childhood with the latency peri d I a pati nt whose ase I was ble to study and who wa overtaken by this d order at a ery late date t became *clear that the determini g* cause of his regression and of th emerge ce of his obsess al eurosis was a real occurrence that impa red a gen tal life which had up till then been tact

A rega ds a metapsychological explanat on f regre s n I am in lined to fi d it in *defu sion of inst ct* in a d tachment of the t c compo ts which t th beginn ng of the ge t l tage had bec me joined to the de truc ti cathe es bel ging to the sadistic phase

In bringi g regre o about the eg cores th first point in its d f n e truggle against the dema d of the lib do In this c nn ction we hall find t d antag us to distingu sh the m e ge e al t on of *d f nc f m repr s on* Repres ly e of th mechanisms which defence m kes u e f It is perhaps in obsessi nal ca e m re than in n rmal or hysterical o es that we can mo t clea ly re ognize that the motive f rce of defe e is th castration com ple d that what is be ng wa d d ff are the t ds f th Oed pus compl x. W e t present dealing with the beginning of the latency period period whi h s char ct rized by the pa ing way of th Oedipus complex the

ego and processes in the id I found that out breaks of anxiety and a general state of anxiety preparedness were produced by certain sexual practices such as *coitus interruptus* undischarged sexual excitement or enforced abstinence—that is whenever sexual excitement was inhibited arrested or deflected in its progress towards gratification Since sexual excitement was an expression of libidinal instinctual impulses it did not seem too rash to assume that the libido was turned into anxiety through th[illegible] a[illegible]ency of these d[illegible] which I [illegible] over it [illegible] [illegible]bido belonging to the id processes is subjected to interruption at the instigation of repression We can still maintain therefore that in repression anxiety is produced from the libidinal cathexes of the instinctual impulses But how can we reconcile this conclusion with our other conclusion that the anxiety felt in phobias is an ego anxiety and arises in the ego and that it does not proceed out of repression but on the contrary sets repression in motion? There seems to be a contradiction here which is not at all simple to solve It will not be easy to reduce the two sources of anxiety to a single one We might attempt to do so by supposing that when coitus is disturbed or sexual excitement interrupted or abstinence enforced the ego scents certain dangers to which it reacts with anxiety But this takes us nowhere On the other hand our analysis of the phobias seems to admit of no correction *Non liquet*

CHAPTER V

WE set out to study the formation of symptoms and the secondary struggle waged by the ego against symptoms But in picking on the phobias for this purpose we have clearly made an unlucky choice The anxiety which predominates in them appears to complicate and obscure the picture There are plenty of neuroses which exhibit no anxiety whatever True conversion hysteria is one of these Even in its most severe symptoms no admixture of anxiety is found This fact alone ought to warn us against making too close a connection between anxiety and symptom formation The phobias are so closely akin to conversion hysteria in every other respect that I have felt justified in classing them with it under the name of *anxiety hysteria* But no one has as yet been able to say what it is that determines whether any given case shall take the form of a conversion hysteria or a phobia—has been able that is to say to establish how the production of anxiety in hysteria is conditioned

The commonest symptoms of conversion hysteria—motor paralyses contractures involuntary actions or discharges pains and hallucinations—are cathectic processes which are either permanently maintained or intermittent But this puts fresh difficulties in the way Not much is actually known about these symptoms Analysis can show what the disturbed excitatory process is which the symptoms replace It usually turns out that they themselves have a share in that process It is as though they had concentrated in themselves the whole energy of the process For instance it will be found that the pains from which a patient suffers were present in the situation in which the repression occurred or that his hallucination was at that time a perception or that his motor paralysis stands for a defence against an action which he had meant to perform but which had been inhibited or that his contracture is usually a displacement of an intended innervation of the muscles in some other part of his body or that his convulsions are the equivalent of an outburst of affect which has been withdrawn from the normal control of the ego The sensation of unpleasure which accompanies the appearance of the symptoms varies in a striking degree In chronic symptoms which have been displaced on to motility like paralyses and contractures it is almost always entirely absent the ego behaves towards the symptoms as though it had nothing to do with them In intermittent symptoms and in those concerned with the sensory field unpleasure is as a rule distinctly felt and in symptoms of pain it may reach an extreme degree The picture presented is so manifold that it is difficult to discover the factor which permits of all these variations and yet establishes a uniformity in them There is moreover little to be seen in conversion hysteria of the ego s struggle against the symptom after it has been formed It is only when sensitivity to pain in some part of the body constitutes the symptom that that symptom is in a position to play a dual role In that case the symptom of pain will appear no less regularly whenever the part of the body concerned is touched from outside than when the pathogenic situation which it represents is associatively activated from within and the ego will take precautions to prevent the symptom from being arou ed through external perceptions Why the formation of symptoms in

creation or consolidation of the super ego and the erection of ethical and aesthetic barriers in the ego In obsessional neuroses these processes are carried further than is normal In order to effect the destruction of the Oedipus complex a regressive degradation of the libido takes place as well the super ego becomes exceptionally severe and unkind and the ego in obedience to the super ego produces strong reaction formations in the shape of conscientiousness pity and cleanliness Implacable though not therefore always successful severity is shown in putting down the temptation to continue early infantile masturbation which is now attached to regressive (sadistic anal) ideational ima es but which still represents the unsubjugated part of the phallic organization There is an inherent contradiction about this state of affairs in which precisely in the interests of masculinity (castration anxiety) every activity belonging to masculinity is stopped But here too obsessional neurosis is only overdoing the normal method of abolishing the Oedipus complex We once more find an illustration of the truth that every exaggeration contains the seed of its own destruction For under the guise of obsessional acts the masturbation that has been suppressed approaches ever more closely to gratification

The reaction formations in the ego of the obsessional neurotic which we have recognized as exaggerations of normal character formation should be regarded I think as yet another mechanism of defence and placed on the same level as regression and repression They seem to be absent or very much weaker in hysteria Looking back we can now get an idea of what is peculiar to the defensive process in hysteria It seems that in it the process is limited to repression alone The ego turns away from the disagreeable instinctual impulse and leaves it to pursue its course in the unconscious taking no further part in its lot This view cannot be absolutely correct for we are acquainted with the case in which a hysterical symptom is at the same time a fulfilment of a penalty imposed by the super ego but it may describe a general characteristic of the behaviour of the ego in hysteria

We can either simply accept it as a fact that in obsessional neurosis a super ego of this severe kind emerges or we can take the regression of the libido as the fundamental characteristic of the affection and attempt to relate the severity of the super ego to it And indeed the super ego originating as it does in the id cannot dissociate itself from the regression and defusion of instinct which have taken place there We cannot be surprised if it becomes harsher unkinder and more tormenting than where development has been normal

The chief task during the latency period seems to be the warding off of the temptation to masturbate This struggle produces a series of symptoms which appear in a typical fashion in the most different individuals and which bear the general character of ceremonial It is a great pity that no one has as yet collected them and systematically analysed them Being the earliest products of the neurosis they should best be able to shed li ht on the mechanisms employed in its symptom formation They already exhibit those features which are destined to come to the fore so fatefully in the serious illness that lies ahead—the manner in which the symptoms are introduced into certain procedures (which later on become almost automatic) in connection with going to sleep washing dressing and walking about as well as the tendency to repetition and delay Why this should be so is at pre ent not at all clear but the sublimation of anal erotic components plays an unmistakable part

The advent of puberty opens a new chapter in the history of an obsessional neurosis The organization at the genital level which has been stopped in childhood starts again with great vigour But as we know the sexual development of the child determines what direction this new start will take Not only will the early aggressive impulses be reawakened but a greater or lesser proportion of the new libidinal impulses—in bad cases the whole of them—will have to follow the course prescribed for them by regression and will emerge as aggressive and destructive tendencies In consequence of the erotic trends being disguised in this way and owing to the powerful reaction formations in the ego the struggle against sexuality will henceforward be carried on under the banner of ethical principles The ego will recoil with astonishment from promptings to cruelty and violence which enter con ciousness from the id and it has no notion that in them it is combating erotic wishes including many which it would otherwise not have taken exception to The super ego overstrict as it is insists all the more strongly on the suppression of sexuality seeing that the latter has assumed such repulsive forms Thus in obsessional neurosis the conflict is aggravated in two directions the defensive forces become more intolerant and

some phantasies or a manifestation of aggressive trends. It must not relax, but is constantly prepared for a struggle. It fortifies its compulsion to concentrate and to isolate by the help of those magical acts of isolation which, in the form of symptoms, grow to be so noticeable and to have so much practical importance for the patient, but which are actually, of course, useless and in the nature of ceremonials.

But in thus endeavouring to prevent associations and connections of thought, the ego is obeying one of the oldest and most fundamental commands of obsessional neurosis, the taboo of touching. If one asks oneself why the avoidance of touching, contact, or contamination should play such a large part in this neurosis and should become the subject-matter of complicated systems, the answer is that touching and physical contact are the immediate aim of the aggressive as well as the loving object-cathexes. Eros desires contact because it strives to make the ego and the loved object one, to abolish all barriers of distance between them. But the first requisite of destructiveness too which (before the invention of long-range weapons) can only take effect *at close quarters*, is physical contact, a coming to grips. To *touch* a woman has become a euphemism for using her as a sexual object. Not to *touch* one's genitals is the phrase employed for forbidding autoerotic gratification. Since obsessional neurosis begins by persecuting touching in its erotic sense and then, after regression has taken place, goes on to persecute it in its new sense of aggressiveness, nothing is so strongly proscribed in this illness as touching nor so well suited to become the central point of a system of prohibitions. Now isolation is a removal of the possibility of its being *touched*, to withdraw it from any sort of contact. When a neurotic isolates an impression or an activity by interpolating an interval, he lets it be understood symbolically that he will not allow his thoughts about that impression or activity to come into associative contact with his other thoughts.

This is as far as our investigations into the formation of symptoms take us. It is hardly worth while summing them up, for the results they have yielded are scanty and incomplete and tell us scarcely anything that we do not already know. It would be fruitless to turn our attention to symptom-formation in other disorders besides phobias, conversion-hysteria, and obsessional neurosis, for too little is known about them. But in reviewing those three neuroses together we are brought up against a very serious problem the consideration of which can no longer be put off. All three have as their starting-point the destruction of the Oedipus complex, and in all three the motive force of the ego's opposition is, we believe, the fear of castration. Yet it is only in the phobias that this fear comes to the surface and is acknowledged as such. What has become of it in the other two neuroses? How has the ego spared itself this fear? The problem becomes accentuated when we recollect the possibility already referred to that anxiety arises directly, by a kind of fermentation, as it were, from a libidinal cathexis whose processes have been disturbed. Furthermore, is it absolutely certain that fear of castration is the only motive force of repression or defence? If we think of neuroses in women we are bound to doubt it. For though we can with certainty establish in them the presence of a castration complex, we can hardly *speak with propriety of castration anxiety* where castration has already taken place.

CHAPTER VII

LET us go back again to infantile phobias of animals, for we still know more about them than about others. In animal phobias, then, the ego has to oppose a libidinal object-cathexis coming from the id—a cathexis that belongs either to the positive or the negative Oedipus complex—because it believes that to give way to it would entail the danger of castration. This question has already been discussed, but there still remains a doubtful point to clear up. In Little Hans' case—that is, in the case of a positive Oedipus complex—was it his fondness for his mother or was it his aggressiveness towards his father which called out the defence of the ego? In practice it seems to make no difference, especially as each set of feelings implies the other; but the question has a theoretical interest, since it is only the feeling of affection for the mother which can count as a purely erotic one. The aggressive impulse flows mainly from the instinct of *destruction*; and we have always believed that in a neurosis it is against the demands of the libido and not against those of any other instinct that the ego is defending itself. In point of fact we know that, after Hans's phobia had been formed, his tender attachment to his mother seemed to disappear, having been completely disposed of by repression, while the symptom-formation (substitutive formation) took place in relation to his aggressive impulses. In the Wolf Man the situation was simpler. The impulse that was

and endeavours by means of motor symbolism to blow away not merely the consequence of some occurrence experience or impression but those very events themselves I choose the term blow away advisedly so as to remind the reader of the part played by this technique not only in neuroses but in magical acts popular customs and religious ceremonies as well In obsessional neurosis we first come across the technique of undoing what has been done in symptoms which occur in two phases—*dichronous* symptoms—in which one action is cancelled out by a second so that it is as though neither action had taken place whereas in reality both have This aim of undoing is the second underlying motive of obsessional ceremonials the first being to take precautions in order to prevent the occurrence or recurrence of some given event The difference between the two is easily seen the precautionary measures are rational whilst the measures taken to abolish something by undoing it are irrational and magical It is of course to be suspected that the latter is the earlier motive of the two and proceeds from an animistic attitude towards the environment This endeavour to undo shades off into normal behaviour in the case in which a person decides to regard an event as not having happened But whereas he will take no direct steps against the event and will simply look away from it and its consequences the neurotic person will try to make the past itself non existent He will try to repress it by motor means The same aim may perhaps be present in and account for the compulsion to repeat actions which is so frequently met with in obsessional neuroses and which serves a number of contradictory purposes at once When anything has not happened in the desired way it can be undone by being repeated in a different way and now all the motives that exist for lingering over such repetitions come into play as well As the neurosis proceeds we often find that one symptom forming motive of first rate importance is the endeavour to undo a traumatic experience We thus unexpectedly discover a new motor technique of defence or (as we may say in this case with less inaccuracy) of repression

The second of these techniques that we are setting out to describe for the first time that of isolation is characteristic for obsessional neurosis It too takes place in the motor sphere When the subject has done something which has a significance for his neurosis or after something unpleasant has happened he will interpolate an interval during which nothing further may happen—during which he may perceive nothing and do nothing This behaviour which seems so strange at first sight is soon seen to have a relation to repression We know that in hysteria a traumatic experience is able to be overtaken by amnesia In obsessional neurosis this can often not be achieved But instead of being forgotten the experience is deprived of its affect and its associative connections are suppressed or interrupted so that it remains as though isolated and is not reproduced in the ordinary processes of thought The effect of isolation is thus the same as the effect of repression with amnesia This technique is then carried out in the isolations of obsessional neurosis It is at the same time reinforced in a magical sense from the motor sphere The elements that are held apart in this way are precisely those which belong together associatively Motor isolation is meant to ensure an interruption of the connection in thought The normal phenomenon of concentration provides a pretext for this kind of neurotic procedure The normal person concentrates on what seems to him important in the way of an impression or a piece of work in order that it shall not be interfered with by the intrusion of any other mental processes or activities But even he uses concentration to keep away not only what is irrelevant or unimportant to the matter in hand but above all what is unsuitable because it is contradictory He is most disturbed by those elements which once belonged to it but which have been discarded in the course of his development—as for instance by any manifestation of the ambivalence belonging to his father complex in his relation to God or by any impulses attached to his excretory organs in his emotions of love Thus in the normal course of things the ego has a great deal of isolating work to do in its function of directing the current of thought And as we know in carrying out our analytic technique we have to train it to relinquish that function eminently justified as it is in itself for the time being

All analysts have found that it is especially difficult for the obsessional neurotic to carry out the fundamental rule of psycho analytic treatment Probably his ego is more watchful and makes sharper isolations because of the high degree of tension due to conflict that exists between his super-ego and his id While his thoughts are working his ego has to keep off too much in the way of an intrusion of uncon

CHAPTER III

repressed was his feminine attitude towards his father and that attitude was a genuinely erotic one And it was in relation to that impulse too that the formation of his symptoms took place

It is almost humiliating that after working so long we should still be having difficulty in understanding the most fundamental facts But we are determined to simplify nothing and to hide nothing If we cannot see things clearly we will at least see clearly what the obscurities are What is hampering us here is evidently some hitch in the development of our theory of the instincts We began by tracing the organization of the libido through its successive stages—from the oral through the sadistic anal to the genital—and in doing so placed all the components of the sexual instinct on the same footing Later it appeared that sadism was the representative of another instinct which was opposed to Eros This new view that the instincts fell into two groups seems to explode the earlier view of the successive stages of libidinal organization But we do not have to break fresh ground in order to find a way out of the difficulty The solution has been at hand for a long time and consists in the fact that what we are concerned with are scarcely ever pure instinctual impul es but mixtures in various proportions of the two groups of instincts If this is so there is no need to revise our view of the organizations of the libido A sadistic cathexis of an object may legitimately claim to be treated as a libidinal one and an aggressive impulse against the father can just as well be subjected to repression as a loving impulse towards the mother Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization A case like Little Hans s does not enable us to come to any clear conclusion It is true that in him an aggressive impulse had been disposed of by repression but this happened after the genital organization had been attained

This time we will keep our attention on the question of anxiety We have said that as soon as the ego recognized the danger of castration it gave the signal of anxiety and inhibited through the pleasure unpleasure system (in a way which we cannot as yet understand more fully) the impending cathetic process in the id At the same time the phobia became formed and now the castration anxiety was directed to a different object and expressed in a distorted form so that the patient was afraid not of being castrated by his father but of being bitten by a horse or eaten by a wolf This substitutive formation had two obvious advantages In the first place it avoided a conflict due to ambivalence (for the father had been a loved object too) and in the second place it enabled the ego to cease producin anxiety For the anxiety belonging to a phobia is conditional it only emerges when the object of it is perceived and rightly so since it is only then that the danger situation is present There is no need to be afraid of being castrated by a father who is not there On the other hand one cannot get rid of a father he can appear whenever he chooses But if he is replaced by an animal all one has to do is to avoid the sight of it—that is its presence—in order to be free from dan er and anxiety Little Hans therefore imposed a restriction upon his e o He produced the inhibition of not leaving the house so as not to come across any horses The youn Russian had an even easier time of it for it was hardly a privation for him not to look at a particular picture book any more If his naughty sister had not always been showing him the book with the picture of the wolf standin upright in it he would have been able to feel safe from his fears

On a previous occasion I have stated that phobias have the character of a projection in that they replace an internal instinctual danger by an external perceptual one The advantage of doing this comes from the fact that the individual can protect himself against external dangers by fleeing from them and avoidin the perception of them whereas it is useless to try to flee from dangers that arise from within This statement of mine was not incorrect but it did not go below the surface of things For an instinctual demand is after all not dangerous in itself it only becomes so inasmuch as it entails a real external danger the dan er of castration Thus what happens in a phobia in the last resort is merely that one external danger is replaced by another The view that in a phobia the ego is able to escape anxiety by means of avoidance or inhibitory symptoms fits in th h —

f [illegible] n a ective reaction on the part of the ego to danger and the danger which is being

signalled in this way is the danger of castration. The anxiety differs in no respect from the anxiety which the ego normally feels in situations of danger except that its content remains unconscious and only becomes conscious in the form of a distortion.

The same is true I think, of the phobias of grown-up persons, although the material that undergoes modification in their neuroses is much more abundant and there are some additional factors in the formation of the symptoms. Fundamentally the position is identical. The agoraphobic patient imposes a restriction upon his ego so as to escape a certain instinctual danger namely the danger of giving way to his erotic desires. For if he did so the danger of being castrated, or some similar danger would once more be conjured up as it was in his childhood. I may cite as an instance the case of a young man who became agoraphobic because he was afraid of yielding to the solicitations of prostitutes and of contracting a syphilitic infection from them as a punishment.

I am well aware that a great number of cases exhibit a much more complicated structure and that many other repressed instinctual impulses can enter into a phobia. But they are only tributary streams which have for the most part joined the main current of the neurosis at a later stage. The symptomatology of agoraphobia, for example, is complicated by the fact that the ego does not confine itself to making a renunciation. In order to rob the situation of danger it does more: it usually effects a temporal regression to infancy (in extreme cases to pre-natal days, that is, to a time when the individual was in his mother's womb and protected against the dangers which beset him in the present). A regression of this kind now becomes a condition whose fulfilment exempts the ego from making its renunciation. For instance, an agoraphobic patient may be able to walk in the street provided he is accompanied like a small child by someone he knows and trusts; or for the same reason, he may be able to go out alone provided he remains within a certain distance of his own house and does not go to places which are not familiar to him or where people do not know him. What these stipulations are will depend in each case upon the infantile factors which dominate him through his neurosis. The phobia of being alone is unambiguous in its meaning irrespective of any infantile regression: it is, ultimately an endeavour to avoid the temptation to indulge in solitary masturbation. Naturally infantile regression can only take place when the individual is no longer a child.

A phobia generally sets in only after a first anxiety attack has been experienced in specific circumstances, such as in the street or in a train or in solitude. Thereafter the anxiety is held in ban by the phobia, but it re-emerges whenever the protective stipulation cannot be fulfilled. The mechanism of phobia does good service as a means of defence and tends to be very stable. A continuation of the defensive struggle in the shape of a struggle against the symptom occurs frequently but not invariably.

What has been said about anxiety in phobias is true of obsessional neuroses as well. In this respect it is not difficult for us to put obsessional neuroses on a level with phobias. In the former the mainspring of all later symptom formation is clearly the ego's fear of the super-ego. The danger situation from which the ego must get away is the hostility of the super-ego. There is no trace of projection here; the danger is completely internalized. But if we ask ourselves what it is that the ego fears from the super-ego we cannot but think that the punishment threatened by the latter must be an extension of the punishment of castration. Just as the father has become depersonalized in the shape of the super-ego, so has the fear of castration at his hands become transformed into an undefined social or moral anxiety. But this anxiety is concealed. The ego escapes it by obediently carrying out the behests, precautions, and penances that have been enjoined on it. If it is impeded in doing so, it is at once overtaken by an acute feeling of discomfort which may, I think, be regarded as an equivalent of anxiety and which the patients themselves liken to anxiety.

The conclusion we have come to then is this. Anxiety is a *reaction to a situation of danger*. It is obviated by the ego's doing something to avoid that situation or to withdraw from it. It might be said that symptoms are created so as to prevent anxiety from emerging. But this does not go deep enough. It would be truer to say that symptoms are created so as to avoid a danger situation whose approach has been signalled by the emergence of anxiety. In the cases that we have discussed, the danger concerned was the danger of castration or something that is an off-shoot of castration.

If anxiety is a reaction of the ego to danger we shall be tempted to regard the traumatic neuroses which so often follow upon a narrow escape from death, as a direct result of a fear of

death (or fear *for* life) and to dismiss from our minds the que tion of castration and the sub ordinate relations of the ego Most physicians who observed the traumatic neuroses that occurred during the great war took this line and triumphantly announced that proof was now forthcoming that a threat to the instinct of elf preservation could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the com plicated hypotheses of psycho analysis It is in fact greatly to be regretted that not a sin le analysis of a traumatic neurosis of any value is extant And it is to be regretted not because such an analysis would contradict the aetio logical importance of sexuality—for any such contradiction has long since been disposed of by the introduction of the concept of narcissism which brings the libidinal cathexis of the ego into line with the cathexes of objects and emphasizes the libidinal character of the in stinct of self preservation—but because in the absence of any analyses of this kind we have lost a precious opportunity of making decisive discoveries about the relations between anxiety and the formation of symptoms In view of all that we know about the structure of the com paratively simple neuroses of everyday life it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger without any par ticipation of the deeper levels of the mental apparatus But the unconscious seems to con tain nothing that would lend substance to the concept of the annihilation of life Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother s breast at weaning But nothing resembling death can ever have been experienced or if it has as in fainting it has left no observable traces behind I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is re acting is one of being abandoned by the pro tecting super ego—the powers of destiny—so that it has no longer any safeguard again t all the dangers that surround it In addition it must be remembered that in those experiences which lead to a traumatic neurosis the pro tective barrier against external stimuli has been broken through and over great quantities of excitation impinge upon the mental apparatus so that we have here the second possibility that anxiety is not only being signalled as an affect but is also being created anew out of the economic conditions of the situation

The statement I have just made to the effect that the ego has been prepared to expect castration by having undergone constantly repeated object losses places the question of anxiety in a new light We have hitherto regarded it as an affective signal of danger But now since the danger [illegible]
[illegible]
[illegible]
[illegible] which make a ainst this view we cannot but be struck by one very remark able correlation The first experience of anxiety through which the individual goes is (in the case of human bein s at all events) birth and objectively speaking birth is a separation from the mother It can be compared to a castration of the mother (by equating the child with a penis) Now it would be very satisfactory if anxiety as a symbol of separation were to be repeated on every subsequent occasion on which a separation took place But unfor tunately we are prevented from making use of this correlation by the fact that birth is not experienced subjectively as a separation from the mother since the foetus being a completely narcissistic creature is totally unaware of her existence as an object Another adverse argu ment is that we know what the affective re actions to separation are they are pain and mourning not anxiety Incidentally it may be remembered that in discussing the question of mourning we also failed to discover why it should be such a painful thing

CHAPTER VIII

THE time has come to pause and reflect What we clearly want is some idea of what anxiety really is some criterion that will enable us to distinguish true statements about it from false ones But this is not easy to get Anxiety is not so simple as all that Up till now we have arrived at nothing but contradictory views about it none of which can to the unprejudiced eye be given preference over the other I therefore propose to adopt a d fferent pro cedure I propose to assemble quite impartially all the facts that we do know about anxiety and to give up the idea of making any im mediate synthesis of them

Anxiety then is in the first place something that is felt We call it an affective state al though we are also ignorant of what an affect

M [illegible] g [illegible] d M l ch l (917) C llect d P p IV

is. As a feeling anxiety has a very marked quality of unpleasure But that is not the whole of its quality Not every unpleasure is *anxiety* for there are other sensations such as tension pain, or mourning which have the quality of unpleasure Thus anxiety must have other distinctive features besides this quality Can we succeed in finding out what the differences are between these various unpleasurable affects?

We can at any rate note one or two things about the feeling of anxiety Its unpleasurable quality seems to have a character of its own—something not very obvious whose presence is difficult to prove yet which is in all likelihood there. But besides having this special character which is difficult to isolate we notice that anxiety is accompanied by fairly definite physical sensations which can be referred to particular organs of the body As we are not concerned here with the physiology of anxiety we shall content ourselves with mentioning a few examples of these sensations. The clearest and most frequent ones are those connected with the respiratory organs and with the heart. They provide evidence that motor innervations i.e., processes of discharge play a part in the general phenomenon of anxiety

Analysis of anxiety states therefore reveals the existence of (1) a specific quality of unpleasure, (2) acts of discharge and (3) perceptions of those acts The two last points indicate at once a difference between states of anxiety and other similar states, like those of mourning and pain. The latter do not have any motor manifestation or if they have the manifestation is not an integral part of the whole state but is distinct from it as being a result of it or a reaction to it Anxiety then is a special state of unpleasure with acts of discharge along particular channels In accordance with our general views we should be inclined to think that anxiety is based upon an increase of excitation which, on the one hand produces the quality of unpleasure and, on the other finds relief through the channels of discharge mentioned above But a purely physiological account of this sort is scarcely sufficient We are tempted to assume the presence of a historical factor which binds the sensations of anxiety and its innervations firmly together In other *words that* an anxiety state is the reproduction of some experience which contains the necessary conditions for such an increase of excitation and a discharge along particular channels and that from this circumstance the unpleasure of anxiety receives its specific character In man birth is a prototypic experience of this kind and one is therefore *inclined to regard* anxiety states as a reproduction of the trauma of birth.

This does not imply that anxiety occupies a different position from all the other affective states In my opinion, the other affects are also reproductions of very early, perhaps even pre individual, experiences of vital importance and I should be inclined to regard them as universal typical and innate hysterical attacks comparable with the recently and individually acquired attacks which occur in hysterical neuroses and whose origin and *significance as memory symbols* have been revealed by analysis *Of course* it would be very desirable to be able to demonstrate the truth of this view in a number of such affects—a thing which is still very far from being the case

Certain immediate objections to this view *that anxiety goes back to the event of birth* have to be met It may be argued that anxiety common

Therefore there can be anxiety without the prototype of birth But this objection takes us beyond the barrier that divides psychology from biology It may be precisely because anxiety *has an indispensable biological function* to fulfil as a reaction to a state of danger that it is differently fashioned in different living beings We do not know besides, whether anxiety involves the same sensations and innervations in creatures far removed from man as it does in man himself Thus there is no good argument here against the view that in man, anxiety is modelled upon the process of birth.

If the structure and origin of anxiety are as *described* the next question is what is the function of anxiety and on what occasions is it reproduced? The answer seems to be obvious and convincing anxiety arose originally as a reaction to a state of danger and it is reproduced whenever a state of that kind recurs

This answer however raises further considerations. The innervations involved in the original state of anxiety probably had a meaning and purpose just as have the muscular movements which accompany a first hysterical attack. In order to understand an hysterical attack all one has to do is to look for a situation in which the movements in question would form

part of an appropriate and expedient action Thus in birth it is probable that the innervations in being directed to the respiratory organs are preparing the way for the activity of the lungs and that in accelerating the heart beat they are helping to keep the blood free from toxic substances Naturally when the anxiety state is reproduced later on as an affect it will be lacking in any such expediency just as the repetitions of a hysterical attack are When the individual is placed in a new situation of danger it may well be quite inexpedient for him to respond with an anxiety state (which is a reaction to an earlier danger) instead of initiating a reaction which is appropriate to the present danger But his behaviour may become expedient once more if he recognizes the dan er situation before it has actually overtaken him and signals its approach by an outbreak of anxiety In that case he can at once get rid of his anxiety by having recourse to more suitable measures Thus we see that there are two ways in which anxiety can emerge in an expedient way when a new situation of danger has occurred or in an expedient way in order to give a signal and prevent such a situation from occurring

But what is a *danger?* In the act of birth there is a real danger to life We know what this means objectively but what it means in a psychological sense we have no idea The dan er of birth has as yet no mental content for the subject One cannot possibly suppose that the foetus has any sort of knowledge that its life is in danger of being destroyed It can only be aware of some vast upheaval in the economy of its narcissistic libido Very large quantities of excitation crowd in upon it giving rise to new sensations of unpleasure and many organs acquire an increased cathexis thus foreshadowing the object cathexis which will soon set in What elements in all this can be considered to be distinctive of a *danger situation?*

Unfortunately far too little is known about the mental constitution of the new born child to make a direct answer possible I cannot even vouch for the validity of the description I have just given It is easy to say that the baby will repeat its affect of anxiety in every situation which recalls the event of birth The important thing to know is what it is that recalls that event and what it is in that event that is recalled

All we can do is to examine the occasions on which infants or rather older children show readiness to produce anxiety In his book on the trauma of birth Rank has made a determined attempt to establish a relationship between the earliest phobias of children and the impressions made on them by the event of birth But I do not think he has been successful. His theory is open to two objections In the first place he assumes that the infant has received certain sensory impressions in particular of a visual kind at the time of birth the renewal of which can recall to its memory the trauma of birth and thus evoke a reaction of anxiety This assumption is quite unfounded and extremely improbable It is not credible that a child should retain any but tactile and general sensations relating to the process of birth If later on children show fear of small animals that disappear into holes or emerge from them this reaction according to Rank, is due to their perceiving an analogy But it is an analogy of which they cannot be aware In the econd place in consid [illegible]

[illegible] ia uterine existence now on its recollection of the traumatic disturbance which interrupted that existence so that he is able to make almost any interpretation he pleases There are moreover certain examples of child hood anxiety which directly traverse his theory When for instance a child is left alone in the dark one would expect it accordin to his view to welcome the re establishment of the intra uterine situation yet it is precisely on such occasions that the child reacts with anxiety And if this is explained by saying that the child is bein reminded of the interruption which the event of birth made in its intra uterine happiness then one can no longer shut one s eyes to the far fetched character of such explanations

I am driven to the conclusion that the earliest phobias of infancy cannot be directly traced back to impressions of birth and that so far they have not been explained A certain preparedness for anxiety is undoubtedly present in the infant But this preparedness for anxiety instead of being at its maximum immediately after birth and then slowly decreasing does not emerge till later on as the mental development of the infant proceeds It lasts over a certain period of childhood If the early phobias persist beyond that period one is inclined to suspect the presence of a neurotic disturbance

R k *Th T m f B th d ts Imp tance f P ych A lytic Th py* (9 4)

a.hough here .ra.n it is ot at all clear what their relation is to the undoub ed neuroses that appear L er on in childhood.

Only a few of t.e manifestations of a..xiety in children are comprehensible to us and we must co..... our attention to them. They occur for instance when a child is alone or in the d.rk, or when it finds i.self with an un known person instead of *one to* whom t is used—such as .s mother These three m.ta..ces can be reduced to a single condition namely that f missing someo e who is loved and longed for

Here is the key I thi.k, to an understand ing of a..xiety a.d to a reconciliation of the contradictions that seem t beset i.. The childs memory picture of the person longed f is no doubt in..en.ively ca.hected probably in a hallucinatory way at first. But this has no effect and now it seems as thou.h the longing turns in.o anxiety This anxi ty has all the appeara..ce of bein., an expressi of the child s feeling of not knowing what t do as though in its still undeveloped state t did n t know how t cope with i's cath xis f longing Here anxiety seems to be reaction t the felt loss f t.e bject a.d one is at once reminded of the f ct that castration anxi ty too is a fear of bei.g separated from a highly valued object, and t.at the earliest anxiety f all—t.e primal a..xiety f birth—is brought about on the occasion of a separation *from* the mot..er

But our next re..ectio takes us a step beyond t.is question of loss f bj ct. The reason why t.. infa.t in arms wants to perceive the presence of its m ther is only because t already knows by experience that h gratifies all ts needs without delay The situation then, that it regards as a *danger* and ga..st which t wa..s to be safe-guarded is o e of on-gratifica tion, f growi.g tension due t need against w..h it is helpless. I think that if w dopt t..s view all the f cts fall in o place The situa tion f on-gratification in which th amounts of stimulation rise t an unpleasurabl he ht without t.e infan bei.g ble t master them by m..ing a.d discharging them psych logi cally must be analogous f t t the experience f being born—must be a repet ti n of that situation f danger What both situti ns have in common is an conomic disturbance caused by an a ccumulation of am unts of stimulation which require t be disposed of It is this element which is the real essence of the danger In both cases t.e same reaction of anxiety sets in. (This anxiety reaction is still an expedient one in the child at the sucki..g stage fo ju.t as t ...ted the *lungs of the new born baby* to get rid of the i..ternal s..mali so now in being discharged into the respiratory and vocal muscular apparatus, it calls the mo..her to the ... ... suppose that

the presence of danger

When the child has found out by experience that an external, perceptible object can put an end to the da..gerous situation which is reminiscent of b rth the nature of the danger it fears is displaced from the economic situation on to the cond t on which determined that situation, viz. the loss of object. It is the absence of the mother that is now the danger and as oon as that danger ari.es the small child gives the gnal of anxiety before the dreaded econom c situation has set in. This change const tutes a first important step for ward in the provisi n made by the child for its self-preservation, and at the same time represents a transition from the automatic and in voluntary new-creation of anxiety to the inten..ional reproduction of anxiet as a signal f danger

In these two aspects as an utomatic phe nomenon and as a rescue- ignal anxiety is seen to be a prod ct of the infant s mental *helplessness which is a natural counterpart of* its b ological helplessnes The striki..g coincidence by which th anxiety of the new-born baby and the anxi ty of the infant in arms both depend upon a separation from the mother does not need to be explained on psychol ...cal lines It can be accounted f imply enough from a b ological point of ew for just as th mother originally satis..ed all th needs of the foetus through her own body so now after ts b rth sh continues to do so though partly through othe means Th re is m ch m re continuity between intra ut rine life and earliest infancy than th impressive caesura of the act of birth allows us to believe. What happens is that t.e child s b logical situation as a foetus is replaced for t by a psychological object relation t i.s mother B t we must n t f rget that during ts intra-uterine life the mother was t an object f r the foetus and that at that time there were no object t all as f r as t was co cerned It is bv ous that in this chem f things there is no room for the b-reacti n of the b rth-trauma W cann t find that anxiety has any othe function except that

of being a signal for the avoidance of a danger situation

The importance of the loss of object as a determinant of anxiety extends considerably further For the next transformation of anxiety viz the castration anxiety belonging to the phallic phase is also a fear of separation and is thus attached to the same determinant In this case the danger is of being separated from one s genitals Ferenczi has traced quite correctly I think a clear line of connection between this fear and the fears contained in the earlier situations of danger According to him the high degree of narcissistic value which the penis possesses is due to the fact that this organ is a guarantee to its owner that he can be once more united to his mother—i e to a substitute for her—in the act of copulation Being deprived of it amounts to a renewed separation from her and this in its turn means being helplessly exposed to an unpleasurable tension due to instinctual need as was the case in birth But this need whose increase is feared is now a specific one belonging to the genital libido and is no longer an indeterminate one as in the period of infancy It may be added that for a man who is impotent (that is who is inhibited by the threat of castration) the substitute for copulation is a phantasy of returning into his mother s womb Following out Ferenczi s line of thought one might say that such a man while endeavouring to return to his mother s womb vicariously—by means of his genital organ proceeds to replace that organ regressively by his body as a whole

The progress which the child makes in its development—its growing independence the sharper division of its mental apparatus into several institutions the advent of new needs—cannot fail to exert an influence upon the content of the danger situation We have already traced the change of that content from loss of the mother as an object to castration The next change is enforced by the power of the super ego With the depersonalization of the parental institution from which castration was feared the danger becomes less defined Castration anxiety develops into moral anxiety —social anxiety—and it is not so easy now to know what the anxiety is about The formula *separation and expulsion from the horde* only applies to that later portion of the super-ego which has been formed on the strength of social prototypes not to the nucleus of the super-ego which corresponds to the introjected parental institution Putting it more generally what the ego regards as the danger and responds to with an anxiety signal is that the super-ego should be angry with it or punish it or cease to love it The final transformation which the fear of the super ego undergoes is it seems to me the fear of death (or fear for life) which is a fear of the super ego projected on to the powers of destiny

At one time I attached some importance to the view that what found discharge in anxiety was the cathexis which had been withdrawn in the process of repression This view seems to me no longer of any interest The reason for this is that whereas I formerly believed that anxiety invariably arose automatically through an economic process my present conception of anxiety as a signal given by the ego in order to affect the pleasure unpleasure institution does away with the necessity of considering the economic factor Of course there is nothing to be said against the idea that it is precisely the energy that has been liberated by being withdrawn through repression which is used by the ego to arouse affect but it is no longer of any importance which portion of the general energy is employed for this purpose

This new view of things calls for an examination of another proposition of mine namely that the ego is the actual seat of anxiety I think this proposition still holds good There is as far as can be seen no reason to assign any manifestation of anxiety to the super-ego while the expression *anxiety of the id* stands in need of correction though rather as to its form than its substance Anxiety is an affective state and as such can of course only be felt by the ego The id cannot have anxiety as the ego can for it is not an organization and cannot make a judgment about a situation of danger On the other hand it very often happens that processes take place or begin to take place in the id which cause the ego to produce anxiety Indeed it is probable that the earliest repressions as well as most of the later ones are motivated by an ego anxiety of this sort in regard to processes in the id Here again one may rightly distinguish between the case in which something occurs in the id which activates a danger situation for the ego and induces the latter to give the anxiety signal for inhibition to take place and the case in which a situation analogous to the trauma of birth is established in the id and an automatic reaction of anxiety ensues The two cases may be brought closer together if it is pointed out that the second case applies to the earliest and original danger situation while the first case

regards to any one of the later determinants of anxiety that have been derived from it or with regard to psychological disorders that the second case is operative in the aetiology of the actual neuroses while the first remains typical for that of the psychoneuroses

We see, then, that it is not so much a question of taking back our earlier findings as of bringing them into line with more recent discoveries. It is still an undeniable fact that in sexual abstinence improper interference with the processes of sexual excitation, or deflection of the latter from its psychological modification, anxiety arises directly out of libido in other words that the ego is reduced to a state of helplessness in the face of an excessive tension due to need, as it was in the situation of birth, and that anxiety is then produced. Here once more though the matter is of little importance it is very possible that what finds discharge in anxiety is precisely the surplus of unutilized libido As we know psychoneurosis is especially liable to develop on the basis of an actual neurosis This looks as though the ego were attempting to save itself from anxiety which it has learned to keep in suspension for a while and to bind it by the formation of symptoms. Analysis of the traumatic war neuroses—a term which, by the way covers a great variety of disorders—would probably have shown that a number of them possess the characteristics of actual neuroses

In describing the evolution of the various danger situations from the prototype the act of birth, I have had no intention of asserting that every later determinant of anxiety completely invalidates the preceding one It is true that as the development of the ego goes on the earlier danger-situations tend to lose their force and to be set aside so that we might say that each period of the individual's life has its appropriate determinant of anxiety Thus the danger of psychological helplessness is appropriate to the period of life when his ego is immature the danger of loss of object, to early childhood when he is still dependent on others the danger of castration to the phallic phase and the fear of his super-ego to the latency period. Nevertheless all these danger situations and determinants of anxiety can persist side by side and cause the ego to react to them with anxiety at a later period than the appropriate one or again several of them can come into operation at the same time It is possible moreover that there is a close relationship between the danger-situation that is operative at a given moment and the form taken by the ensuing neurosis.

When in an earlier part of this discussion we found that the danger of castration was of importance in more than one neurotic affection, we put ourselves on guard against over-estimating that factor since it could not be a decisive one for the female sex and since women are undoubtedly more subject to neuroses than men. We now see that there is no danger of our regarding castration anxiety as the sole motive force of the defensive processes which lead to neurosis. I have shown elsewhere how the little girl in the course of her development is led to make a loving object cathexis through her castration complex. It is precisely in women that the danger situation of loss of object seems to have remained the most effective All we need to do is to make a slight modification in our description of their determinant of anxiety in the sense that it is no longer a matter of feeling the want of or actually losing the object itself but of losing the object's love. Since there is no doubt that hysteria has a strong affinity with the nature of women, just as obsessional neurosis has with that of men it appears probable that, as a determinant of anxiety loss of love plays much

CHAPTER IX

WHAT we have now to do is to consider the relationship between the formation of symptoms and the production of anxiety

There seem to be two very widely held opinions on this subject One is that anxiety is itself a neurotic symptom The other is that there is a much more intimate relation between the two According to the second opinion symptoms are only formed in order to avoid anxiety they bind the mental energy which would otherwise be discharged as anxiety Thus anxiety would be the fundamental phenomenon and main problem of neurosis

That this latter opinion is at least in part true is shown by some striking examples If an agoraphobic patient who has been accompanied into the street is left alone there he will have an anxiety attack Or if an obsessional neurotic is prevented from washing his hands after having touched something he will become a prey to almost unbearable anxiety It is plain then that the purpose and the result of having a companion in the street or of washing the hands were to obviate outbreaks of anxiety of this kind In this sense every inhibition which the ego imposes upon itself can be called a *symptom*

Since we have traced back the production of anxiety to a situation of danger we should prefer to say that symptoms are created in order to remove the ego from a situation of danger If the symptoms are prevented from being formed the danger does in fact materialize that is a situation analogous to birth is established in which the ego is helpless in the face of a constantly increasing instinctual demand—the earliest and original determinant of anxiety Thus in our view the relation between anxiety and symptom is less close than was supposed for we have inserted the factor of the danger situation between them We can also add that the production of anxiety sets symptom formation going and is indeed a necessary pre requisite of it For if the ego did not arouse the pleasure unpleasure institution by developing anxiety it would not have the power to arrest the process which is preparing in the id and which threatens danger There is in all this an evident inclination to limit to a minimum the amount of anxiety developed and to employ it only as a signal for to do more would only be to feel in another place the unpleasure which the instinctual process was threatening to produce and that would not be a good result from the standpoint of the pleasure principle although it is one that occurs often enough in the neuroses

The formation of symptoms then does in effect put an end to the danger situation It has two aspects one hidden from view brings about those alterations in the id in virtue of which the ego is removed from danger the other presents to the world what the symptom formation has created in place of the instinctual process which has been affected—namely the substitutive formation

It would however be more correct to ascribe to the defensive process what we have just said about symptom formation and to use the latter term as synonymous with substitute formation It will then be clear that the defensive process is analogous to the method adopted by the ego for removing itself from a danger that threatens it from outside that is to flight The defensive process is an attempt at flight from an instinctual danger An examination of the weak points in this comparison should prove informative One thing that can be said against it is that the loss of an object (or loss of love on the part of the object) and the threat of castration are just as much dangers coming from without as say a ferocious animal would be they are not instinctual dangers Nevertheless the two cases are not the same A wolf would probably attack a man irrespective of his behaviour towards it but the loved person would not cease to love him nor would he be threatened with castration if he did not entertain certain feelings and intentions in his mind. Thus such instinctual impulses are determinants of external dangers and so become dangerous in themselves and the individual can proceed against the external dangers by taking measures against the internal ones In phobias of animals the danger seems to be still entirely felt as an external one just as it has undergone an external displacement in the symptoms In obsessional neuroses the danger is much more internalized That portion of anxiety in regard to the super-ego which constitutes social anxiety represents an internal substitute for an external danger while the other portion—moral anxiety—is already completely endo psychic.

Another objection is that in taking flight from an impending external danger all that the subject does is to increase the distance between himself and what is threatening him He does not

prepare to defend himself against it or attempt to alter anything abo t it as w uld be the ca.e f he attacked the wolf with a stick or — N w h d f s ve process rre ssue and som how suppresses t or deflects t 11o n its aim and thus enders it innocu us This ob j ction seems u impeachable a d must be g ven d e w ght I th nk it is probable that there are some d fens e proce ses which can truly be lik ed to an attempt at fl ght while in others the go takes a much more active line of self prot tio and initiates vigorous coun ter measu es B t pe hap the wh le nalogy between d f nce and flight s inval dated by the fact that both the ego a d the instı ct in th id e parts of the same orga ı atio not separate entitı s like the wolf and the child so that a y kind of behaviour on the part of the eg will ult in a alterat o in the inst nctual proces as well.

This study of the d term nants of anxiety has it were hown the defens ve behaviour f the ego in a ratio l l ght Ea h sit at o of dange corresponds t a part cular period of life o developm tal phase of the mental ap-

WHAT we have now to do is to consider the relationship between the formation of symptoms and the production of anxiety

There seem to be two very widely held opinions on this subject One is that anxiety is itself a neurotic symptom The other is that there is a much more intimate relation between the two According to the second opinion symptoms are only formed in order to avoid anxiety they bind the mental energy which would otherwise be discharged as anxiety Thus anxiety would be the fundamental phenomenon and main problem of neurosis

That this latter opinion is at least in part true is shown by some striking examples If an agoraphobic patient who has been accompanied into the street is left alone there he will have an anxiety attack Or if an obsessional neurotic is prevented from washing his hands after having touched something he will become a prey to almost unbearable anxiety It is plain then that the purpose and the result of having a companion in the street or of washing the hands were to obviate outbreaks of anxiety of this kind In this sense every inhibition which the ego imposes upon itself can be called a *symptom*

Since we have traced back the production of anxiety to a situation of danger we should prefer to say that symptoms are created in order to remove the ego from a situation of danger If the symptoms are prevented from being formed the danger does in fact materialize that is a situation analogous to birth is established in which the ego is helpless in the face of a constantly increasing instinctual demand—the earliest and original determinant of anxiety Thus in our view the relation between anxiety and symptom is less close than was supposed for we have inserted the factor of the danger situation between them We can also add that the production of anxiety sets symptom formation going and is indeed a necessary pre requisite of it For if the ego did not arouse the pleasure unpleasure institution by developing anxiety it would not have the power to arrest the process which is preparing in the id and which threatens danger There is in all this an evident inclination to limit to a minimum the amount of anxiety developed and to employ it only as a signal for to do more would only be to feel in another place the unpleasure which the instinctual process was threatening to produce and that would not be a good result from the standpoint of the pleasure principle although it is one that occurs often enough in the neuroses

The formation of symptoms then does in effect put an end to the danger situation It has two aspects one hidden from view brings about those alterations in the id in virtue of which the ego is removed from danger the other presents to the world what the symptom formation has created in place of the instinctual process which has been affected—namely the substitutive formation

It would however be more correct to ascribe to the defensive process what we have just said about symptom formation and to use the latter term as synonymous with substitute formation. It will then be clear that the defensive process is analogous to the method adopted by the ego for removing itself from a danger that threatens it from outside that is to flight The defensive process is an attempt at flight from an instinctual danger An examination of the weak points in this comparison should prove informative One thing that can be said again t it is that the loss of an object (or loss of love on the part of the object) and the threat of castration are just as much dangers coming from without as say a ferocious animal would be they are not instinctual dangers Nevertheless the two cases are not the same A wolf would probably attack a man irrespective of his behaviour towards it but the loved person would not cease to love him nor would he be threatened with castration if he did not entertain certain feelings and intentions in his mind. Thus such instinctual impulses are determinants of external dangers and so become dangerous in themselves and the individual can proceed against the external dangers by taking measures against the internal ones In phobias of animals the danger seems to be still entirely felt as an external one just as it has undergone an external displacement in the symptoms In obsessional neuroses the danger is much more internalized That portion of anxiety in regard to the super-ego which constitutes social anxiety represents an internal substitute for an external danger while the other portion—moral anxiety—is already completely endo psychic

Another objection is that in taking flight from an impending external danger all that the subject does is to increase the distance between himself and what is threatening him He does not

prepare to defend himself against it or attempt to alter anything about it, as would be the case if he attacked the wolf with a stick or shot at it with a gun. Now the defensive process seems to do something more than would correspond to an attempt at flight. It joins issue with the threatening instinctual process and somehow suppresses it or deflects it from its aims and thus renders it innocuous. This objection seems unimpeachable and must be given due weight. I think it is probable that there are some defensive processes which can truly be likened to an attempt at flight, while in others the ego takes a much more active line of self-protection and initiates vigorous counter-measures. But perhaps the whole analogy between defence and flight is invalidated by the fact that both the ego and the instinct in the id are parts of the same organization, not separate entities like the wolf and the child, so that any kind of behaviour on the part of the ego will result in an alteration in the instinctual process as well.

This study of the determinants of anxiety has, as it were, shown the defensive behaviour of the ego in a rational light. Each situation of danger corresponds to a particular period of life or developmental phase of the mental apparatus and appears to be justifiable for it. In early infancy the individual is really not fitted to master psychologically the large quantities of excitation that *impinge upon him*, whether from without or from within. Again, at a certain period of life his most important interest really is that the people he is dependent on should not withdraw their loving care of him. Later on in his boyhood, when he feels that his father is a powerful rival in regard to his mother and becomes aware of his own aggressive inclinations towards him and of his sexual intentions towards his mother, he really is justified in being afraid of his father; and his fear of being punished by him can find expression through phylogenetic reinforcement in the fear of being castrated. Finally, when he enters into social relationships it really is necessary for him to be afraid of his *super-ego*, his conscience, for the absence of that factor would give rise for him to severe conflicts, dangers and so on.

But this last point raises a new problem. Instead of the affect of anxiety let us take for a moment another affect, say that of pain. It seems quite normal that a girl of four years of age should weep painfully if her doll is broken; or at six, if her schoolmistress reproves her; or at sixteen, if she is slighted by her young man; or at twenty-five, if a child of her own dies. *Each of these determinants of pain* has its own time and each passes away when that time is over. Only the final and definitive determinants remain throughout life. We should think it rather unusual if this same girl, after she had grown to be a wife and mother, were to cry over some worthless trinket that had been damaged. Yet this is how the neurotic behaves. Although all the instances for mastering stimuli have long ago been developed within wide limits in his mental apparatus, and although he is sufficiently *grown-up to gratify* most of his needs for himself and has long ago learnt that castration is no longer practised as a punishment, he nevertheless behaves as though the old danger-situations still existed and retains all the earlier determinants of anxiety.

Why this should be so requires a rather long answer. First of all we must sift the facts. In a great number of cases the old determinants of anxiety do really lapse after having produced neurotic reactions. The phobias of infants, whether of being afraid of being alone or in the dark or among strangers—phobias which can almost be called normal—usually pass off later on; the child grows out of them, as we say about many other disturbances of childhood. Animal phobias, which are of such *frequent occurrence*, undergo the same fate, and many conversion hysterias of early years find no continuation in later life. Ceremonial actions appear extremely often in the latency period but only a very small proportion of them develop later into a full obsessional neurosis. In general, so far as we can tell from our observations of town children belonging to the white races and living according to fairly high cultural standards, the neuroses of childhood are in the nature of regular episodes in a child's development, although too little attention is still being paid to them. Signs of childhood neuroses can be detected in all adult neurotics without exception; but by no means all children who show those signs become neurotic in later life. It must be, therefore, that certain determinants of anxiety are relinquished and certain danger-situations lose their significance as the individual becomes more mature. Moreover, some of these danger-situations manage to survive into later times by modifying their determinants of anxiety so as to bring them up to date. Thus, for instance, a man may retain his fear of castration in the guise

of a syphilidophobia after he has got to know that it is no longer customary to castrate people for indulging their sexual lusts but that on the other hand severe diseases may overtake anyone who thus gives way to his instincts Furthermore some determinants of anxiety such as fear of the super-ego are destined not to disappear at all but to accompany the individual throughout his life In that case the neurotic will differ from the normal person in that his reactions to the dangers in question will be unduly strong Finally being grown up affords no absolute protection against a return of the original traumatic anxiety situation Each individual has in all probability a limit beyond which his mental apparatus fails in its function of mastering the quantities of excitation which require to be disposed of

These minor rectifications cannot in any way alter the main fact that a great many people remain infantile in their behaviour in regard to danger and do not overcome age old determinants of anxiety To deny this would be to deny the existence of neurosis for it is precisely such people whom we call neurotics But how is this possible? Why are not all neuroses episodes in the development of the individual which come to a close when the next phase is reached? Whence comes the element of persistence in these reactions to danger? Why does the affect of anxiety alone seem to enjoy the advantage over all other affects of evoking reactions which are distinguished from the rest in being abnormal and which through their inexpediency run counter to the movement of life? In other words we have once more unexpectedly come upon the riddle which has so often confronted us whence does neurosis come—what is its ultimate its own peculiar meaning? After whole decades of psycho analytic work we are as much in the dark about this problem as ever

CHAPTER X

ANXIETY is the reaction to danger One cannot help suspecting however that the reason why the affect of anxiety occupies a unique position in the economy of the mind has something to do with the essential nature of dan er Yet danger is a universal human experience dangers are the same for everybody What we need and cannot lay our finger on is some factor which will explain why some people are able to subject the affect of anxiety in spite of its unique quality to the ordinary workings of the mind or why others are doomed to break down over this task Two attempts to find a factor of this kind have been made and it is natural that such efforts should meet with a sympathetic reception since they set out to fill a most urgent need The two attempts in question are mutually complementary they approach the problem at opposite ends The first was made by Alfred Adler more than ten years ago He maintained in essence that it was those individuals who were too greatly impeded by some organic inferiority who failed to master the task set before them by danger If it were true that *simplex sigillum veri* we should welcome this answer as a perfect solution of the problem But on the contrary our critical studies of the last ten years have effectively demonstrated the total inadequacy of such an explanation—an explanation moreover which sets aside the whole wealth of material that has been discovered by psycho analysis

The second attempt was made by Otto Rank in 1923 in his book *The Trauma of Birth* It would be unjust to put his attempt on the same level as Adler s except in this single point which concerns us here for it remains upon psycho analytic ground and pursues a psycho analytic line of thought so that it may be accepted as a legitimate endeavour to solve the problems of analysis In this matter of the relation of the individual to danger Rank moves away from the question of organic defect in the individual and concentrates on the variable degree of intensity of the danger

The event of birth is the first situation of danger and the economic upheaval which it produces becomes the prototype of reaction to anxiety We have already traced the line of development which connects this first danger situation and determinant of anxiety with all the later ones and we have seen that they all retain a common quality in so far as they signify in some way a separation from the mother—at first only in a biological sense next as a direct loss of object and later as a loss of object indirectly incurred The discovery of this extensive concatenation is an undoubted achievement of Rank s constructive work Now the trauma of birth overtakes each individual with a different degree of intensity and the violence of his anxiety reaction varies with the strength of the trauma According to Rank whether the individual will ever learn to control his anxiety—whether he will become normal or neurotic—will depend upon the intensity

tempt at flight The repressed is now as it were outlawed it is excluded from the great organization of the ego and is only subject to the laws which govern the realm of the unconscious If now the danger situation changes so that the ego has no reason for wardin off a new instinctual impulse wh h [illegible] o come r[illegible] ue new impulse will run its cour e under an automatic influence—or as I should prefer to say under the influence of the repetition compulsion It will follow the same path as the earlier repressed impulse as thou h the danger situation that had been overcome still existed The fixating factor in repression then is the repetition compulsion of the unconscious id—a compulsion which in normal circumstances is only done away with by the mobile function of the ego The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct its course in accordance with the changed danger situation But in point of fact the ego very seldom succeeds in doing this it cannot undo its repressions It is possible that the way the struggle will go depends upon quantitative relations In many cases one has the impression that the outcome is an enforced one the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat In other cases the entrance of yet another element into the play of forces may be perceived the attraction exerted by the repressed instinctual prototype is reinforced by a repulsion brought to bear by objective difficulties which are opposed to the new impulse taking a different course

That this is the origin of fixation in repression and of the retention of danger situations which are no longer present day ones is confirmed by the fact of psycho analytic therapy —a fact which is modest enough in itself but which can hardly be over rated from a theoretical point of view When in the course of an analysis we have given the ego assistance and have put it in a position to abolish its repressions it recovers its power over the repressed id and can allow the instinctual impulses to run their course as though the old situations of danger no longer existed What we can do in this way is in general accord with the therapeutic achievements of medicine for as a rule we must be satisfied with brin ing about more quickly more certainly and with less expenditure of energy than would otherwise be the case a desired result which in favourable circumstances would have occurred of itself

We see from what has been said that it is quantitative relations—relations which are not directly observable but can only be inferred—which determine whether or no old situations of danger shall be preserved repressions on the part of the ego maintained and childhood neuroses find continuance Amon the factors that play a part in the causation of neuro es and that have created the conditions under which the forces of the mind are pitted agair t one another three emerge into prominence a biological a phylogenetic and a purely psychological factor

The biolo ical factor is the long period of time during which the young of the human species is in a condition of helplessness and dependence Its intra uterine existence eems to be short in comparison with that of mo t animals and it is sent into the world in a le s finished state As a result the influence of the objective world upon it is intensified and it is obliged to make an early differentiation between the e o and the id Moreover the dangers of the outer world have a greater importance for it so that the value of the object which can alone protect it against them and take the place of its former intra uterine life is enormously enhanced This biological factor then establishes the earliest situations of danger and creates the need to be loved which will accompany the child through the rest of its life

The existence of the second phylogenetic factor is based only upon inference We have been led to assume its reality by a remarkable feature in the development of the libido We have found that the exual life of man unlike that of most of the animals nearly related to him does not make a steady advance from birth to maturity but that after an early expansion up till the fifth year it undergoes a very decided interruption and that it then starts on its course once more at puberty beginning from the point at which it broke off in early childhood This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a kind of historical precipitate Th s factor owes its patho enic significance to the fact that the

maj rity of in nctual impul es belonging to n ntile sexualit are tr ted by the ego as d ers and warded off a su h so that the la r sexual impu ses of puberty wh ch in the n ural course of thi gs would be ego synton c run the ri k of succumb to the attraction f their infantile proto ypes a d following them in o repress on It is here that we come upon the most direct aet olo y f the neuroses. I is a curious th g that early contact w th the demands of sexuality should ha e a im ar effect on the e o as premature contact with the external world.

Th third, psychological factor res des in a defect of the mental apparatus which has to d with it differentiation i t d a d ego and which is therefore ultimatel attributable to the influence f the external world In ew of the dangers of objective real ty the ego is obliged t guard against certa n in t nctual impulses in the id and to treat them as da gers But t cannot prot ct tself f m internal in ... t can from

( ) Re tance and Ant Cathexis

An mportant element the theory of re pres is the v ew that p es s t an ev t that curs o ce but that it req re a perman t xpe d ture of gy If th s pendit re of rgy were t as th rep essed impulse whi h s be g fed ll the time f m t sou es of e rgy w ld ze the xt occasion to flow along th h els from whi h t has been forced as de and the rep essi n

chara ter of hysteria. A repressed t ctu l impulse can be acti ated (newly cath ted) from two d ect o s f om with th ou h re inf ement f om its intern l ource f cita ti n, and f om without thro gh the percept on

of an object that it desires The hysterical anti cathexis is mainly directed outwards against dangerous perceptions It takes the form of a special kind of vigilance which by means of restrictions of the ego causes situations to be avoided that would entail such perceptions or if they do occur manages to withdraw the subject s attention from them Some French analysts in particular Laforgue have recently given this action of hysteria the special name of *scotomisation* This technique of anti cathexis is still more noticeable in the phobias where interest is concentrated on removing the subject ever further from the possibility of making the feared perception The fact that anti cathexis should be orientated in an opposite direction in hysteria and the phobias from what it is in obsessional neurosis—though the difference is not an absolute one—seems to be significant It suggests that there is an intimate connection between repression and external anti cathexis on the one hand and between regression and internal anti cathexis (i e alterations in the ego through reaction formations) on the other The task of defending against a dangerous perception is incidentally common to all neuroses Various commands and prohibitions in obsessional neurosis have the same end in view

As has already been seen the resistance that has to be overcome in analysis proceeds from the ego clinging to its anti cathexes It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding or to acknowledge as belonging to itself impulses that are the complete opposite of those which it has made its own Our campaign against resistance in analysis is based upon this view of the facts If the resistance is itself unconscious as so often happens owing to its connection with the repressed material we make that resistance conscious If it is conscious or when it has become conscious we bring forward logical arguments against it we promise the ego reward and advantages if it will give up its resistance There can be no doubt or mistake about the existence of this resistance on the part of the ego But we have to ask ourselves whether it covers the whole state of affairs in analysis For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions and we have called the period of strenuous effort which follows after its praiseworthy decision the phase of *working through* The dynamic factor which makes a working through of this kind necessary and comprehensible is not far to seek It must be that after the ego resistance has been removed the power of the repetition-compulsion —the attraction exerted by the unconscious prototypes upon the repressed instinctual process—has yet to be overcome This factor might well be described as the *resistance of the unconscious* There is no need to be discouraged by these emendations in our theory They are to be welcomed if they do something towards furthering our knowledge and they are no disgrace to us so long as they enrich rather than invalidate our earlier views—by limiting some statement perhaps that was too general or by enlarging some idea that was too narrowly formulated

It must not be supposed that these emendations provide us with a complete review of all the varieties of resistance that are met with in analysis Further investigation of the subject shows that the analyst has to combat no less than five varieties of resistance emanating from three quarters—the ego the id and the super ego The id and the super ego supply one variety apiece while the ego is the source of three each differing in its dynamic nature The first of these three ego resistances is the resistance due to repression which we have already discussed and about which there is least new to be added Next there is the transference resistance which is of the same nature but has different and much clearer effects in analysis since it succeeds in establishing a relation to the analytic situation or the analyst himself and thus re animating a repression which should only have been recollected The third resistance though also an ego resistance is of quite a different nature It proceeds from the epinosic gain and is based upon an assimilation of the symptom by the ego It represents an unwillingness to renounce any gratification or relief that has been obtained The fourth variety belonging to the id is the resistance which as has just been seen necessitates *working through* The fifth belonging to the super ego and the last to be discovered is also the most obscure though not always the least powerful one It seems to originate from the sense of guilt or the need for punishment and it opposes every move towards success including therefore the patient s own recovery through analysis

(*b*) Anxiety from Transformation of Libido

The view of anxiety which I have put for

which these pages di er somewhat from the one I have hitherto be . Formerly I regarded anxiety as a general reaction of the ego t conditions o ter easure. I always sought to account for its appearance ... economic grounds and I assumed, on the strength of my investigations ... the actual neuroses, that libido (sexual excitement) which was rejected or not utilized by the ego found direct discharge in the form of anxiety. It cannot be denied that these various assertions did not go very well together ... any rate did not ... one another. Moreover they gave the impression of there being a specially intimate connection between anxiety and libido and this did not ... with the general character of anxiety as a reaction ... unpleasure.

The objection to this view arose from our coming to regard the ego as the sole seat of anxiety. It was one of the results of the ... attempted ... the mental apparatus which I made in *The Ego and the Id*. Whereas the old view made it natural to suppose that anxiety arose from the libido belonging to the repressed instinctual impulses, the new one tended to make the ego the source of anxiety. Thus it is question of id-anxiety (instinctual anxiety) versus ego-anxiety. Since the energy which the ego employed is desexualized, the new view tended to weaken the close connection between anxiety and libido. I hope I have at least succeeded in making the contradiction plain and in giving a clear idea of the point in doubt.

Rank's contention—which was originally my own—that the affect of anxiety is a consequence of the event of birth and a repetition of the situation then experienced, obliged me to review the problem of anxiety once more. But I could make no headway with his idea that birth is a trauma, states of anxiety a reaction of discharge to it and all subsequent affects of anxiety an attempt to abreact it more and more completely. I was ... to go beyond the anxiety reaction to the situation of danger that lay behind it. The introduction of this element opened up new aspects of the question. Birth was seen to be the prototype of all later situations of danger which overtook the individual under the new conditions arising from a changed mode of life and a growing mental development. The significance of birth in regard to danger was however reduced to its occupying this role of prototype. The anxiety felt at birth became the prototype of an affective state which had to undergo the same vicissitudes as the other affects. Two ... either ... it affects ... itself in ... reproduce ... of a ... tions which resembled the original situation and thus be a ... form of reaction in ... If ... emerged ... one ... it had been in the first situation ... the ego ... power over it ... reproduce ... its own ... and employ it as a warning of danger and as a means of se... the pleasure-unpleasure mechanism in motion. We thus gave the biological aspect of the ... of anxiety its due importance by recognizing anxiety as the general reaction to situations of danger, while we endorsed the part played by the ego as the seat of anxiety by allocating to it the function of producing the affect of anxiety according to its needs. Thus we attributed two sources of ... anxiety in later life. One was ... automatic and always due to economic causes and arose whenever a situation analogous to birth had established itself. The other was produced by the ego as soon as a situation of this kind merely threatened to occur in order that it might be avoided. In the second case the ego subjected itself to anxiety as though to a sort of inoculation, ... to go through a ... attack of the illness in order to escape its full strength. It vividly imagined the danger situation, as it were, with the unmistakable purpose of restricting that distressing experience to a mere indication, a signal. We have already seen in detail how the various situations of danger arise one after the other, retaining at the same time connected in this pattern.

We shall perhaps be able to proceed a little further in our knowledge of anxiety when we turn to the problem of the relation between neurotic anxiety and objective anxiety.

Our former hypothesis of a direct transformation of libido into anxiety possesses less interest for us now than it did. But if we do nevertheless consider this matter, we shall have to distinguish different cases. As regards anxiety evoked by the ego as a signal, it does not come into consideration; nor does it therefore in any of those danger situations which stimulate the ego to bring on repression. The libidinal cathexis of the repressed instinctual impulse is otherwise employed than in being transformed into anxiety and discharged as such, as is most ... seen in conversion hysteria. On the other hand further enquiry into the question of the danger situation will bring to our notice an instance of the production of anxiety which will, I think,

have to be accounted for in a different way

(*c*) Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or to put it more modestly a term of which I made exclusive use thirty years a o when I first began to study the subject but which I later abandoned I refer to the term *defensive process* I afterwards used the word *repression* but the relation between the two remained uncertain It will be an undoubted advantage I think to revert to the old term of *defence* provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis while we retain the word *repression* for that special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance

Even a terminological innovation ought to justify its adoption it ought to reflect some new point of view or some extension of knowledge The revival of the idea of deferce and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries Our first observations of repression and the formation of symptoms were made in connection with hysteria We found that the perceptual content of excitatory experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression Later on when we came to study the obsessional neuroses we saw that in that illness pathogenic occurrences were not forgotten They remained conscious but they were isolated in some way that we could not as yet grasp so that much the same result was obtained as in hysterical amnesia Nevertheless the difference was great enough to justify the belief that the process by which instinctual impulses were set aside in obsessional neurosis could not be the same as in hysteria Further investigations have shown that in ob essional neurosis a regression of the instinctual impulses to an earlier libidinal stage takes place owing to the opposition of the ego and that this regression clearly works in the same sense as repression although it does not make repression unnecessary We have seen too that in obsessional neurosis anti-cathexis which is also presumably pre ent in hysteria plays a specially large part in protecting the ego by effecting a reactive alteration in it Our attention has moreover been drawn to a process of *isolation* (whose technique cannot as yet be elucidated) which has direct symptomatic manifestations of its own and to a procedure that may be called magical of *undoing* what has been done—a procedure about whose repudiating purpo e there can be no doubt but which has no longer any resemblance to the process of repression These observations provide good enough grounds for re introducing the old concept of defence which can cover all of the e processes with their same purpo e—namely the protection of the ego against instinctual demands—and for subsumin repression under it as a special instance The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses as for instance between repression and hysteria In addition we may look forward to the possible discovery of yet another important relationship It may well be that before its sharp cleavage into an ego and an id and before the formation of a super ego the mental apparatus makes use of different methods of defence from those which it employs after it has attained these levels of organization

B *Supplementary Remarks on Anxiety*

The affect of anxiety exhibits one or two features the study of which promises to throw further light on the subject Anxiety has an unmistakable affinity with expectation it is anxiety *about* something It has a quality of indefiniteness and lack of object In preci e speech we use the word *fear* rather than *anxiety* if the feeling has found an object Moreover in addition to its relation to danger anxiety has a relation to neurosis which we have long been trying to elucidate The question arises why are not all reactions of anxiety neurotic—why do we accept so many of them as normal? And finally the problem of the difference between objective anxiety and neurotic anxiety awaits a thorough examination

To begin with the last problem The advance we have made is that we have gone behind reactions of anxiety to situations of danger If we do the same thing with objective anxiety

Fre d The Def ce N u Psychoses (1894)
ee p e 81 above

we shall have no difficulty in solving the question. Objective danger is a danger that is known, and objective anxiety is anxiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger. Neurotic danger is thus a danger that has still to be discovered. Analysis has shown that it is an instinctual danger. By bringing this danger which is not known to the ego into consciousness, the analyst makes neurotic anxiety no different from objective anxiety, so that it can be dealt with in the same way.

There are two reactions to objective danger. One, an affective reaction, is an outbreak of anxiety. The other is a protective action. The same will presumably be true of instinctual danger. We know how the two reactions can cooperate in an expedient way, the one giving the signal for the other to appear. But they can also behave in an inexpedient way: paralysis due to anxiety may set in, and the one reaction spread at the cost of the other.

In some cases the characteristics of objective anxiety and neurotic anxiety are mingled. The danger is known and objective but the anxiety in regard to it is over-great, greater than seems proper. It is this surplus of anxiety which betrays the presence of a neurotic element. Such cases, however, contain no new principle. For analysis shows that to the known objective danger is attached an unknown instinctual one.

We can find out still more. Not being content with tracing anxiety back to danger, we go on to enquire what the essence and meaning of a danger-situation is. Clearly, it consists in the subject's estimation of his own strength compared to the magnitude of the danger and in his admission of helplessness in the face of it—physical helplessness if the danger is objective and psychological helplessness if it is instinctual. In doing this he will be guided by the actual experiences he has had. (Whether he is wrong in his estimation or not is immaterial for the outcome.) Let us call a situation of helplessness of this kind that has been actually experienced a *traumatic situation*. We shall then have good grounds for distinguishing a traumatic situation from a danger-situation.

The individual will have made an important advance in his capacity for self-preservation if he can foresee and expect a traumatic situation of this kind entailing helplessness, instead of simply waiting for it to happen. Let us call a situation which contains the determinant for such expectation a *danger situation*. It is in this situation that the signal of anxiety is made. The signal announces: "I am expecting a situation of helplessness to set in", or: "The present situation reminds me of one of the traumatic experiences I have had before. Therefore I will anticipate the trauma and behave as though it had already come, while there is yet time to turn it aside." Anxiety is therefore on the one hand an expectation of a trauma, and on the other a repetition of it in a mitigated form. Thus the two features of anxiety which we have noted have a different origin. Its connection with expectation belongs to the danger-situation, whereas its indefiniteness and lack of object belong to the traumatic situation of helplessness—the situation which is anticipated in the danger-situation.

Taking this sequence, anxiety—danger—helplessness (trauma)—we can now summarize what has been said. A danger-situation is a recognized, remembered and expected situation of helplessness. Anxiety is the original reaction to helplessness in the trauma and is reproduced later on in the danger-situation as a signal for help. The ego, which has experienced the trauma passively, now repeats it actively in a weakened version, in the hope of being able itself to direct its course. It is certain that children behave in this fashion towards every painful impression they receive, by reproducing it in their play. In thus changing from passivity to activity they attempt to master their experiences psychologically. If this is what is meant by "*abreacting a trauma*" we can have nothing to urge against the phrase. But what is of decisive importance is the first displacement of the anxiety reaction from its origin in the situation of helplessness to an expectation of that situation, that is, to the danger-situation. After that come the later displacements, from the danger to the determinant of the danger—loss of the object and the modifications of that loss with which we are already acquainted.

The undesirable result of "spoiling" the small child is to increase the importance of the danger of losing the object (the object being a protection against every situation of helplessness) in comparison with every other danger. It therefore encourages the individual to remain in the state of childhood, the period of life which is characterized by motor and mental helplessness.

So far we have had no occasion to regard objective anxiety in any different light from neurotic anxiety. We know what the distinction is. An objective danger is a danger which threatens a person from an external object,

have to be accounted for in a different way

(c) Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or to put it more modestly a term of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned I refer to the term *defensive process* I afterwards used the word *repression* but the relation between the two remained uncertain It will be an undoubted advantage I think to revert to the old term of *defence* provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis while we retain the word *repression* for that special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance

Even a terminological innovation ought to justify its adoption it ought to reflect some new point of view or some extension of knowledge The revival of the idea of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries Our first observations of repression and the formation of symptoms were made in connection with hysteria We found that the perceptual content of excitatory experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression Later on when we came to study the obsessional neuroses we saw that in that illness pathogenic occurrences were not forgotten They remained conscious but they were isolated in some way that we could not as yet grasp so that much the same result was obtained as in hysterical amnesia Nevertheless the difference was great enough to justify the belief that the process by which instinctual impulses were set aside in obsessional neurosis could not be the same as in hysteria Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage takes place owing to the opposition of the ego and that this regression clearly works in the same sense as repression although it does not make repression unnecessary We have seen too that in obsessional neurosi anti cathexis which is also presumably present in hysteria plays a specially large part in protecting the ego by effecting a reactive alteration in it Our attention h [illegible] ess of *isolat* [illegible] be elucidat[illegible] manifestations of its own and to a procedure that may be called ma ical of *undoing* what has been done—a procedure about whose repudiating purpo e there can be no doubt but which has no longer any resemblance to the process of repression These observations provide good enough grounds for re introducing the old concept of defence which can cover all of the e processes with their same purpo e—namely the protection of the ego against instinctual demands—and for subsuming repression under it as a special instance The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses as for instance between repression and hysteria In addition we may look forward to the possible discovery of yet another important relationship It may well be that before its sharp cleavage into an ego and an id and before the formation of a super ego the mental apparatus makes use of different methods of defence from those which it employs after it has attained these levels of organization

B *Supplementary Remarks on Anxiety*

The affect of anxiety exhibits one or two features the study of which promises to throw further light on the subject Anxiety has an unmistakable affinity with expectation it is anxiety *about* something It has a quality of indefiniteness and lack of object In precise speech we use the word *fear* rather than *anxiety* if the feeling has found an object Moreover in addition to its relation to danger anxiety has a relation to neurosis which we have long been trying to elucidate The question arises why are not all reactions of anxiety neurotic—why do we accept so many of them as normal? And finally the problem of the difference between objective anxiety and neurotic anxiety awaits a thorough examination

To begin with the last problem The advance we have made is that we have gone behind reactions of anxiety to situations of danger If we do the same thing with objective anxiety

F ud The Defe ce Neu o P ych es (1894) ee pa 81 above

we shall have no difficul y in solving the ques tion. Objective danger is a danger that is known, and objective anxiety is a xiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger Neurotic danger is thus a danger that has still to be discovered Analysis has shown that it is an in tinctual danger By bringing this danger which is not known to the ego into consciousness, the ana lyst makes eurotic anxiety no d ff rent from bjective anxiety so that it can be dealt with in the sam wa

There are two reactions to object ve danger One an affective reaction, is an outbreak of anxiety The other is a protective action. Th same will presumabl be true of in ti ctual danger We know how the two reactions can co-opera e in an expedient way the one gi ng he signal for the other to appear But they can also behave in an expedient way paralys s the t anxiety may set in and the one reaction spread at the cost of the other

In some cases the characterist cs of obj ct ve anxiety and neurotic anxiety are m ngled The danger is known and object ve but the anxiety in regard to it over-great greater than seems proper It is this surplus f anxi ty which be trays the presence f a neuroti lement. uch cases however contain no new principle f r analysis shows that to th known bjective danger is ttached an unknown in t ctual one.

We can find out still m re bout this f not content with traci g anxiety back to danger we go on to enq ire what the essence and meani g of dange -situation is Clearly it con ts in the subject s estim tion of h own trength compared to th magnitud f th danger and in his adm on f h lplessness in the f of it—physical helples es f the danger ob jective and psych logical helples ness f t is instinctual. I d in this he will be gu ded by the actual experi ces he has had. (Wheth he is wrong in his estim tion not is imma rial for the outcome) Let us call tuation of helplessness f this kind that has been actuall experienced t mat c sit t on We shall then have good grou ds f distinguishin traumatic situation f om dange -s tuat on

The indi dual will have mad an important dvance in his capacity f self-preservation f he can foresee and expect a traumatic tuation f this kind entailing helpless ess instead f simply waiting for t t happen. Let us call a situa on which contains the d t rminant for an expectation f thi kind a d ger sit at on It is in this situati that the ignal of anxiety is made The s nal a nounces "I am expect ing a situat on of helplessness to et in or

ha e as though it had already come wni e there is yet t me to turn it as de" Anxiety is there- f re on the o e hand an expectation of a trau ma and on the other a repet tion of i in a m t gated form Thus the two features of anxi et which we ha e n ted ha e a d erent origin Its co nection w th expectation belongs t the

T ki g this sequence—anxiety-dan er help- les ess (trauma)—we can now ummari e what has been said A da ger-s tuation a recognized remembered and expected situa ti n of helpless ess. Anxiety is the original reactio to h lplessness in the trauma and is reproduced late on in the danger-s uat on as a s gnal for help The ego which has undergone th trauma passi ely now repeat it acti el i a weakened vers hoping to have the d rec tio of it in i s own hands It i certain that children beha e i this fa h on towards every painful impress n they rece ve by reprod c ing it in the r pla In thus cha gi g from passivity to act ty they attempt to ma ter it psych l gically If th s what is me nt by ab-r ct g a t cum we can ha e nothing to urge again t the phrase But what s of dec ve importance is the first d splacement of the anxiet react on from its origi n the s tuat on of helplessness to n expectat on of that tua tio that is to the danger s tuat on After that come the later d splaceme t from the da ger to the determ na t of the danger—los of the object and th mod ficat ons of that loss with wh ch w are lready acquainted

The undesirabl result of *spoil g* the small child is to increase the importan of th dan g of losi g the object (the object bei g a protecti agai st every s tuati n of helples ness) in comparison w th every other danger It th ref re en ourage th indi idual to re *main in the state of childhood* the period of life which i charact rized by motor and men tal h lpl ssness.

So f we have had o occas n to regard *objecti e* anx ty in any different light from neurotic anxi ty We kn w what th d tinct on is An bj ctive danger s a da ge whi h thre t ns a person from n external object,

have to be accounted for in a different way

(*c*) Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or to put it more modestly a term of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned I refer to the term *defensive process*[1] I afterwards used the word *repression* but the relation between the two remained uncertain It will be an undoubted advantage I think to revert to the old term of *defence* provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis while we retain the word *repression* for that special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance

Even a terminological innovation ought to justify its adoption it ought to reflect some new point of view or some extension of knowledge The revival of the idea of defence and the restriction of that of repression takes [illegible] to account a fa [illegible] but which h [illegible] to some new [illegible] our first observations of repression and the formation of symptoms were made in connection with hysteria We found that the perceptual content of excitatory experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression Later on when we came to study the obsessional neuroses we saw that in that illness pathogenic occurrences were not forgotten They remained conscious but they were isolated in some way that we could not as yet grasp so that much the same result was obtained as in hysterical amnesia Nevertheless the difference was great enough to justify the belief that the process by which instinctual impulses were set aside in obsessional neurosis could not be the same as in hysteria Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage takes place owing to the opposition of the ego and that this regression clearly works in the same ense as repression although it does not make repression unnecessary We have seen too that in obsessional neurosis anti-cathexis which is also presumably present in hysteria plays a specially large part in protecting the ego by effecting a reactive alteration in it Our attention has moreover been drawn to a process of *isolation* (who e technique cannot as yet be elucidated) which has direct symptomatic manifestations of its own and to a procedure that may be called magical of *undoing* what has been done—a procedure about whose repudiating purpose there can be no doubt but which has no longer any resemblance to the process of repression These ob ervations provide good enough grounds for re introducing the old concept of defence which can cover all of the e processes with their same purpose—namely the protection of the ego against instinctual demands—and for subsuming repression under it as a special instance The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses as for instance between repression and hysteria In addition we may look forward to the possible discovery of yet another important relationship It may well be that before its sharp cleavage into an e o and an id and before the formation of a super ego the mental apparatus makes use of different methods of defence from those which it employs after it has attained these levels of organization

B *Supplementary Remarks on Anxiety*

The affect of anxiety exhibits one or two features the study of which promises to throw further light on the subject Anxiety has an unmistakable affinity with expectation it is anxiety *about* something It has a quality of indefiniteness and lack of object In precise speech we use the word *fea* rather than *anxiety* if the feeling has found an object Moreover in addition to its relation to danger anxiety has a relation to neurosis which we have long been trying to elucidate The question arises why are not all reactions of anxiety neurotic—why do we accept so many of them as normal? And finally the problem of the difference between objective anxiety and neurotic anxiety awaits a thorough examination

To begin with the last problem The advance we have made is that we have gone behind reactions of anxiety to situations of danger If we do the same thing with objective anxiety

[1] Fre d The Def ce Ne o P y h ses (894) see p ge 81 above

see her again and repeated consolatory experi ences to the contrary are necessary before he learns that her d sappearance is u ually fol

tal
g
to

h joy uncovering it again. In these cir um stances he can as it were feel lon ng unmixed with despair

In cor equence of the infa t s misunder standing of th f cts the situation of miss ng *his mother is not a dan er-s tuat on but a trau* ma one Or to put t m e correctl it is a traumatic s tuat on if he happen at the time t be feeling a need which he is the o e to f this

(hich is equated with loss f the bject it self) There is as yet no quest n of loss of love. It s only later on that experi nce teaches th child that the object can be present but angry with him and then lo of love on the part of the bject becomes new nd much m re enduring dan e and d term t of anxiety

The traumatic tuat o of mis g the mother di ers in important respect from the tra mati s tuation of b rth. At b rth no object existed and so o obj t could be missed Anx *iety was the nl react o that occurred S nc* then repeated tuations of gratificat on ha e resulted in sett g up the mothe as an obj t and this object whenever the f nt feels a eed re e es an intense the of l n g It is t thi ew pe t f thi gs that the reac t on of pain is ferabl Pain is thus the tual rea ti to loss f object d anxi ty is the rea tion t th dang which that loss ntails a d in ts furth d pl ement reaction t the da ge *of th loss* f bj t itself

We know ry littl bout pain e ther The onl f ct we re c rtain of s that pai *occurs* in th first in tan e a d as a regul thi when e t mulus which impinges o the periph ry b eaks through the p t ct e barrier gain t timuli and proceeds t a t lik co ti ual in s'inctual timulus again t whi h muscula a ti which is s rul eff ctiv because t ithdraws the pla that s being tim l ted from th timul s pow le s. If the pain doe t proceed f om a part f the sk n but f om n int rnal ga th s tuat on is t ll the same All that has happen d is that port on of the inner periphery has taken the place of the outer periphery The child ob iou ly has occa sion to undergo exper ences of pa n of this sort wh ch ha e no relat on to its experiences of need. Th s determ ant of the evelopment of pa ems however to have very l ttle s m larity w th the loss of an object And be s des the element which is essential to pain peripheral stimulat n is entirely absent in the chi d s s tuat n of l g g Yet it cannot be *for nothi g* that the common usage of speech sh uld have created the n ion of internal mental pa n and have treated the feeling of loss of object as equ valent to phys cal pa

When there is phys cal pain a h gh degree of what may be termed *are sn tic c thexis of the painful place* occurs Th cath xi conti ues to increase a d tends as it wer to empty the ego It is well known that, when i ternal or gans are gi ing pa n spatial and other im ges *of the aff cted part of th body* arise though that part is not represented in conscious id a tion on other occas o Again the rema kable truth that when the m d is d erted to some other interest by psychological means even the most intense phys cal pa s fail to arise (I must not v rema n unconscious in th s case) can be *accounted for by the fact* that th re is a concentrat on f cathexis on the psychical representati e of the part of th body which is gi ing pain I th k t i here that we shall find the point f analogy wh h has en *bled us to carry sensat ons of pa over t the* ment l sphere For the econ mic cond t ons that are produced by the intense cathe s of l g ng which is c ce trated o the mi sed or lo t object (a c thexis wh ch steadily mounts up because it cannot be appeased) are the sam a the eco om c cond tions that are pro duced by the cathexis of pain wh ch is concen trated on the injured part of the body Thus the element of th peripheral ca sat on f physi cal pain ca be left out of ccount The trans t on fr m phy cal pain to mental pa c r *respo ds to a cha g f om narciss stic c th xis* t bj t-cathexis. The object whose presenta t on is highly cathected by n ti ctual eed plays the same r l the part of th body wh ch cathected by an increase of t mulus The tin nat re f th cathect c process and the impo s bility of inhib ti it p od ce th same tate of me t l h lpl s es If th *feeling of unpleasure* which thus ar ses has the spec fic qual ty f pa (a qual ty which cann t be more exa tly d scribed) t d f mani festing itself th rea t e form f anxi ty

and a neurotic danger is one which threatens him from an instinctual demand In so far as the instinctual demand is something objective his neurotic anxiety too can be admitted to have an objective basis We have seen that the reason why there seems to be a specially close connection between anxiety and neurosis is that the ego defends itself against an instinctual danger with the help of the anxiety reaction just as it does against an external objective danger but that this line of defensive activity eventuates in a neurosis owing to an imperfection of the mental apparatus We have also come to the conclusion that an instinctual demand often only becomes an (internal) danger because its gratification would bring on an external danger i e because the internal danger represents an external one

On the other hand the external (objective) danger must have managed to become internalized if it is to be significant for the ego It must have been recognized as related to some situation of helplessness that has been experienced Man does not seem to have been endowed or has been endowed in but small measure with an instinctive recognition of the dangers that threaten him from without Small children are constantly doing things which endanger their lives and that is precisely why they cannot afford to be without a protecting object With regard to the traumatic situation in which the subject is helpless external and internal dangers objective dangers and instinctual demands converge Whether the ego is suffering from a pain which will not stop or experiencing an accumulation of instinctual needs which cannot obtain gratification the economic situation is the same and the motor helplessness of the ego finds expression in psychological helplessness

In this connection the puzzling question of the phobias of early childhood deserves to be mentioned once a ain Some of them such as the fear of being alone or in the dark or with strangers can be understood as reactions to the danger of losing the object Others like the fear of small animals thunderstorms etc. might perhaps be accounted for as vestigial traces of the congenital preparedness to meet objective dangers which is so strongly developed in other animals In man only that part of this archaic inheritance is appropriate which has reference to the loss of object. If his childhood phobias become fixated and grow stronger and persist into later years analysis shows that their content has become associated with instinctual demand and has come to stand for internal dangers as well

C *Anxiety Pain and Mourning*

So little is known about the psychology of processes of feeling that the tentative remarks I am about to make on the subject may claim a very lenient judgment The problem before us arises out of the conclusion we have reached that anxiety comes to be a reaction to the danger of losing the object. Now we already know one reaction to the loss of an object and that is mourning The question therefore is when does loss of object lead to anxiety and when to mourning? In discussing the subject of mourning on a previous occasion I found that there was one feature about it which remained quite unexplained This was its peculiar painfulness. And yet it somehow seems self evident that separation from an object should be painful Thus the problem becomes more complicated when does separation from an object produce anxiety when does it produce mourning and when does it produce it may be only pain?

Let me say at once that there is no prospect of answering these questions at present We must content ourselves with drawing certain distinctions and adumbrating certain possibilities

Our starting point will again be the one situation which we believe we understand—the situation of the infant when he is pre ented with a stranger instead of his mother He will exhibit the anxiety which we have attributed to the dan er of loss of object But hi anxiety is undoubtedly more complicated than this and merits a more thorough discussion That he does have anxiety there can be no doubt but the expression of his face and his reaction of crying indicate that he is feeling pain as well Certain things seem to be confused in him which will later on be separated out He cannot as yet distinguish between temporary absence and permanent loss As soon as he misses his mother he behaves as if he were never going to

[1] C lle ted P per IV firs p blished earl in In Imag V I. reprinted in S mml g 4th Series 5

this may very likely be due to a certain factor which we have not sufficiently made use of in our explanatory efforts I refer to the high level of cathexis and attachment at which the unpleasurable processes we have been discussing take place

We know of yet another reaction of feeling to the loss of an object and that is mourning But we have no longer any difficulty in accounting for it Mourning occurs under the influence of reality testing for the latter function demands categorically from the bereaved person that he should separate himself from the object since it no longer exists Mourning is entrusted with the task of carrying out this retreat from the object in all those situations in which it was the recipient of a high degree of cathexis That this separation should be painful fits in with what we have just said in view of the high degree and insatiable nature of the cathexis of longing which is concentrated on the object by the bereaved person during the reproduction of the situations in which he must undo the ties that attach him to it

tion between civil and military sections of the population, the claims of pri ate property It tramples in blind fury on all that comes in its way as though there were to be no f ture a d goodwill among men after it has passed It rends all bonds of fellowship between the con tending peoples and threatens to lea e such a legacy of embitterment s will make any re newal of such bonds impossible for a long time to come.

M reover it has brought to light the almost unbel evable phenomenon of a mutual com prehension between th ci ilized nat ons so slight that the one can turn with hate a d loath ing upon th other Nay m re—that one of the great civilized nations is so universall un popular that the attempt can actually be m de to exclude it from the ci lized commun ty as *barbaric* although it long has proved ts fitness by the most magnificent co-operation in the work of ci ilization. We li e in the hope that the impartial decision of hist ry will furnish the proof that precisely this nation th s in whose tongue w w write this for whose ctory our dear ones are fighting was the one which least transgressed the laws of ci ilization—b t at such a time who shall dare present himself as the judge f his own cause

Nations are in a measure represented by the states which th y ha e f rmed these states by the governments which dminister them. Th individual in any gi en nation has this wa a terrible pportunity to c ince hims lf of hat would occas o lly trike him in peace time—that th tat has f b dden t th indi vidual the pract c f wrong-d ing not bec use it desired t bolish t but because it desires to monopoliz t like salt and tobacc The wa ring st t permit tself every uch misdeed every such ct f lence as would disgrac th indi dual man. It practises t only the cepted trata gems but als d liberat lying and deceptio gainst the enemy and this too in a measure which appears to surpass th usage f f rmer wars The tat exacts the utmost degree f bedien e and sa rifi e from ts tizens but at th sam time t eats them as children by maintaining an excess of secrecy and censo ship f ws and express ons f opini that rend rs th sp rits f those thus int llectually oppressed d fen less against every unf ur able turn f events and every sinister rumour It bsol es its lf from th guarantees and on tracts t had formed with ther states and makes unabashed onfession f ts rapac ty and lust f power which th private indi d ual is then called upon to sanction in the name of patriotism.

Nor may it be obj cted that the state cannot refra n from wrong-d g since that would place t at a disadvantage It is no less d ad an tageous as a general rule for the ind vi u l man to conf rm to the customs of moral ty and refrain from brutal and arb trary conduct and the state bu s ldom proves able to indemnify him for the sacrifi es it exacts It cannot be a ma te for astonis ment therefo e that this relaxat on f all the moral t es between the greater un ts of ma kind should ha e had a seducing influence on the moral ty f ind vid uals for our conscience is not the inflexible j dge that ethical teachers are wont t declare it, but in i s origin s *d ead of the commun ty* and nothing else When the community has no rebuke to make, there is an end of all suppression of the baser passions and men perpetrate deeds f cruel y fraud treachery and ba bar ity so ncompat ble with their c ilizat on that one w u d ha e held th m to be impossible

Well may that ci lized cosmopolitan there fore of wh m I spoke sta d h lples in a world grown strang to him—his all-embraci g patrimony disintegrated the common estates in it laid waste the f llow-c tizens embro led and debased

In critic sm of his disillus onment, nev rtheles certain thi gs must be sa d. Strictly peak in it is not justified for t consi ts in the destruct on of—an illusion! We welcome illus ons

and a e hattered gainst it.

Tw things in this war ha e evoked our sen e of disillus onment the destitut on shown in moral rel ti ns externally by the states which in th interior relat ns pose as the guardians of ccepted moral usage and the brutal ty in behavi ur shown by indi duals, whom as pa tak rs in th highest f rm f human ci ilization one wo ld not ha e credited with s ch thing

Let us begin with th second point and en dea our to f rmulate as succinctly as may be th point of ew which it is p posed to criti cize H w do w imagine the process by which an indi dual ttains to a high r plane of m ral ty? The first answer is ure to be He is good and nobl f om his very birth, his ery earliest beginnings We need t c sid this any f ther A cond an wer will suggest that we are concerned with a de elopme tal process and

that within these civilized states were mingled remnants of certain other races who were universally unpopular and had therefore been only reluctantly and even so not to the fullest extent admitted to participation in the common task of civilization for which they had shown themselves suitable enough But the great nations themselves it might have been supposed had acquired so much comprehension of their common interests and enough tolerance for the differences that existed between them that *foreigner* and *enemy* could no longer as still in antiquity be regarded as synonymous

Relying on this union among the civilized races countless people have exchanged their native home for a foreign dwelling place and made their existence dependent on the conditions of intercourse between friendly nations But he who was not by stress of circumstances confined to one spot could also confer upon himself through all the advantages and attractions of these civilized countries a new a wider fatherland wherein he moved unhindered and unsuspected In this way he enjoyed the blue sea and the grey the beauty of the snow clad mountains and of the green pasture lands the magic of the northern forests and the splendour of the southern vegetation the emotion inspired by landscapes that recall great historical events and the silence of nature in her inviolate places This new fatherland was for him a museum also filled with all the treasures which the artists among civilized communities had in the successive centuries created and left behind As he wandered from one gallery to another in this museum he could appreciate impartially the varied types of perfection that miscegenation the course of historical events and the special characteristics of their mother earth had produced among his more remote compatriots Here he would find a cool inflexible energy developed to the highest point there the gracious art of beautifying existence elsewhere the sense of order and fixed law—in short any and all of the qualities which have made mankind the lords of the earth

Nor must we forget that each of these citizens of culture had created for himself a personal Parnassus and School of Athens From among the great thinkers and artists of all nations he had chosen those to whom he conceived himself most deeply indebted for what he had achieved in enjoyment and comprehension of life and in his veneration had associated them with the immortals of old as well as with the more familiar masters of his own tongue None of these great figures had seemed to him alien because he had spoken another language—not the incomparable investigator of the passions of mankind nor the intoxicated worshipper of beauty nor the vehement and threatening prophet nor the subtle mocking satirist and never did he on this account rebuke himself as a renegade towards his own nation and his beloved mother tongue

The enjoyment of this fellowship in civilization was from time to time disturbed by warning voices which declared that as a result of long prevailing differences wars were unavoidable even among the members of a fellowship such as this We refused to believe it but if such a war indeed must be what was our imaginary picture of it? We saw it as an opportunity for demonstrating the pro ress of mankind in communal feeling since the era when the Greek Amphictyones had proclaimed that no city of the league might be demolished nor its olive groves hewn down nor its water cut off As a chivalrous crusade which would limit itself to establishing the superiority of one side in the contest with th [illegible] of dire st [illegible] to the de [illegible] for the wounded who must of necessity withdraw from the contest as well as for the phy[illegible]cians and nurses who devoted themselves to the task of healing And of course with the utmo[illegible] precautions for the non combatant classes of the population—for women who are debarred from war work and for the children who grown older should be enemies no longer but friends and co operators And again with preservation of all the international undertakings and institutions in which the mutual civilization of peace time had been embodied

Even a war like this would have been productive of horrors and sufferings enough but it would not have interrupted the development of ethical relations between the greater units of mankind between the peoples and the states

Then the war in which we had refused to believe broke out and brought—di illusionment Not only is it more sangu nary and more destructive than any war of other days because of the enormously increased perfection of weapons of attack and defence but it is at least as cruel as embittered as implacable as any that has preceded it It sets at naught all those restrictions known as International Law which in peace time the states had bound themselves to observe it ignores the prerogatives of the wounded and the medical service the distinc

to that portion of the instinctual life which remains untransformed is a very variable one.

Generally speaking, we are apt to attach too much importance to the innate part, and in addition to this we run the risk of overestimating the general adaptability to civilization in comparison with those instincts which have remained in their primitive state—by which I mean that in this way we are led to regard human nature as better than it actually is. For there is, besides, another factor which obscures our judgement and falsifies the issue in too favourable a sense.

The impulses of another person are naturally hidden from our observation. We deduce them from his actions and behaviour, which we trace to motives born of his instinctual life. Such a conclusion is bound to be, in many cases, erroneous. This or that action which is good from the civilized point of view may in one instance be born of a noble motive, in another not so. Ethical theorists class as good actions only those which are the outcome of good impulses; to the others they refuse their recognition. But society, which is practical in its aims, is little troubled on the whole by this distinction; it is content if a man regulates his behaviour and actions by the precepts of civilization, and is little concerned with his motives.

We have seen that the external compulsion exercised on a human being by his upbringing and environment, produces a further transformation towards good in his instinctual life—a turning from egoism towards altruism. But this is not the regular or necessary effect of the external compulsion. Education and environment offer benefits not only in the way of love, but also employ another kind of premium system, namely, reward and punishment. In this way their effect may turn out to be that he who is subjected to their influence will choose to "behave well" in the civilized sense of the phrase, although no ennoblement of instinct, no transformation of egoistic into altruistic inclinations, has taken place within. The result will, roughly speaking, be the same; only a particular concatenation of circumstances will reveal that one man always acts rightly because his instinctual inclination compels him so to do, and the other is good only in so far and for so long as such civilized behaviour is advantageous for his own egoistic purposes. But superficial acquaintance with an individual will not enable us to distinguish between the two cases, and we are certainly misled by our optimism into grossly exaggerating the number of human beings who have been transformed in a civilized sense.

Civilized society, which exacts good conduct and does not trouble itself about the impulses underlying it, has thus won over to obedience a great many people who are not thereby following the dictates of their own natures. Encouraged by this success, society has suffered itself to be led into straining the moral standard to the highest possible point, and thus it has forced its members into a yet greater estrangement from their instinctual dispositions. They are consequently subjected to an unceasing suppression of instinct, the resulting strain of which betrays itself in the most remarkable phenomena of reaction and compensation formations. In the domain of sexuality, where such suppression is most difficult to enforce, the result is seen in the reaction-phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, but is shown in malformations of character, and in the perpetual readiness of the inhibited instincts to break through to gratification at any suitable opportunity. Anyone thus compelled to act continually in the sense of precepts which are not the expression of his instinctual inclinations, is living, psychologically speaking, beyond his means, and might objectively be designated a hypocrite, whether this difference be clearly known to him or not. It is undeniable that our contemporary civilization is extraordinarily favourable to the production of this form of hypocrisy. One might venture to say that it is based upon such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with the psychological truth. Thus there are very many more hypocrites than truly civilized persons—indeed, it is a debatable point whether a certain degree of civilized hypocrisy be not indispensable for the maintenance of civilization, because the cultural adaptability so far attained by those living today would perhaps not prove adequate to the task. On the other hand, the maintenance of civilization even on so questionable a basis offers the prospect of each new generation achieving a farther-reaching transmutation of instinct, and becoming the pioneer of a higher form of civilization.

From the foregoing observations we may already derive this consolation—that our mortification and our grievous disillusionment regarding the uncivilized behaviour of our world-compatriots in this war are shown to be un-

will probably assume that this development consists in eradicating from him the evil human tendencies and under the influence of education and a civilized environment replacing them by good ones From that standpoint it is certainly astonishing that evil should show itself to have such power in those who have been thus nurtured

But this answer implies the thesis from which we propose to dissent In reality there is no such thing as *eradicating* evil tendencies Psychological—more strictly speaking psychoanalytic—investigation shows instead that the inmost essence of human nature consists of elemental instincts which are common to all men and aim at the satisfaction of certain primal needs These instincts in themselves are neither good nor evil We but classify them and h
m

all those instincts which society condemns as evil—let us take as representatives the selfish and the cruel—are of this primitive type

These primitive instincts undergo a lengthy process of development before they are all w d
o h

and to some extent turned back upon their possessor Reaction formations against certain instincts take the deceptive form of a change in content as though egoism had changed into altruism or cruelty into pity These reaction formations are facilitated by the circumstance that many instincts are manifested almost from the first in pairs of opposites a very remarkable phenomenon—and one strange to the lay public—which is termed the *ambivalence of feeling* The most easily observable and comprehensible instance of this is the fact that intense love and intense hatred are so often to be found together in the same person Psychoanalysis adds that the conflicting feelings not infrequently have the same person for their object

It is not until all these *vicissitudes to which instincts are subject* have been surmounted that what we call the character of a human being is formed and this as we know can only very inadequately be classified as *good* or *bad* A human being is seldom altogether good or bad he is usually *good* in one relation and *bad* in another or *good* in certain external circumstances and in others decidedly *bad* It is interesting to learn that the existence of strong *bad* impulses in infancy is often the actual condition for an unmistakable inclination towards *good* in the adult person Those who as children have been the most pronounced egoists may well become the most helpful and self sacrificing members of the community most of our sentimentalists friends of humanity champions of animals have been evolved from little sadists and animal tormentors

The transformation of *bad* instincts is brought about by two co-operating factors an internal and an external The internal factor consists in an influence on the bad—say the egoistic—instincts exercised by erotism that is by the human need for love taken in its widest sense By the admixture of *erotic* components the egoistic instincts are transmuted into *social* ones We learn to value being loved as an advantage for which we are willing to sacrifice other advantages The external factor is the force exercised by upbringing which advocates the claims of our cultural environment and this is furthered later by the direct pressure of that civilization by which we are surrounded Civilization is the fruit of renunciation of instinctual satisfaction and from each newcomer in turn it exacts the same renunciation. Throughout the life of the individual there is a constant replacement of the external compulsion by the internal The influences of civilization cause an ever increasing transmutation of egoistic trends into altruistic and social ones and this by an admixture of erotic elements In the last resort it may be said that every internal compulsion which has been of service in the development of human beings was originally that is in the evolution of the human race nothing but an external one Those who are born today bring with them as an inherited constitution some degree of a tendency (disposition) towards transmutation of egoistic into social instincts and this disposition is easily stimulated to achieve that effect A further measure of this transformation must be accomplished during the life of the individual himself And so the human being is subject not only to the pressure of his immediate environment but also to the influence of the cultural development attained by his forefathers

If we give the name of *cultural adaptability* to a man s personal capacity for transformation of the egoistic impulses under the influence of the erotic we may further affirm that this adaptability is made up of two parts one innate and the other acquired through experience and that the relation of the two to each other and

to that portion of the instinctual life which remains untransformed is a very variable one.

Generally speaking, we are apt to attach too much importance to the innate part, and in addition to this we run the risk of overestimating the general adaptability to civilization in comparison with those instincts which have remained in their primitive state—by which I mean that in this way we are led to regard human nature as *better* than it actually is. justified They were based on an illusion to which we had abandoned ourselves In reality our fellow citizens have not sunk so low as we feared because they had never risen so high as we believed That the greater units of humanity the peoples and states have mutually abrogated their moral restraints naturally prompted these individuals to permit themselves relief for a while from the heavy pressure of civilization and to grant a passing satisfaction to the instincts it holds in check This probably caused no breach in the relative morality within their respective national frontiers

We may however obtain insight deeper than this into the change brought about by the war in our former compatriots and at the same time receive a warning against doin them an injustice For the evolution of the mind shows a peculiarity which is present in no other process of development When a village grows into a town a child into a man the village and the child become submerged in the town and the man Memory alone can trace the earlier features in the new image in reality the old materials or forms have been superseded and replaced by new ones It is otherwise with the development of the mind Here one can describe the state of affairs which is a quite peculiar one only by saying that in this case every earlier stage of development persists alongside the later sta e which has developed from it the successive stages condition a co existence although it is in reference to the same materials that the whole series of transformation has been fashioned The earlier mental state may not have manifested itself for years but none the less it is so far present that it may at any time again become the mode of expression of the forces in the mind and that exclusively as though all later developments had been annulled undone This extraordinary plasticity of the evolution that takes place in the mind i not unlimited in its scope it might be described as a special capacity for retroversion—for regression—since it may well happen that a later and higher stage of evolution once abandoned cannot be reached again But the primitive sta es can always be re established the [illegible]

1 [illegible] with the idea of destruction of the life of mind and soul In reality the destruction relates only to later accretions and developments The es ence of mental disease lies in a return to earlier conditions of affective life and functioning An excellent example of the plasticity of mental life is afforded by the state of sleep which every night we desire Since we have learnt to interpret even absurd and chaotic dreams we know that whenever we sleep we cast off our hard won morality like a garment only to put it on again next morning This divestiture i naturally unattended by any danger because we are paralys d condemned to inactivity by the state of sleep Only through a dream can we learn of the regression of our emotional life to one of the earliest stages of development For instance it is noteworthy that all our dreams are governed by purely egoistic motives One of my En lish friends put forward this proposition at a cientific meeting in America whereupon a lady who was present remarked that that might be the case in Austria but she could maintain for herself and her friends that *they* were altruistic even in their dreams My friend although himself of English race was obliged to contradict the lady emphatically on the ground of his personal experience in dream analysis and to declare that in their dreams hi h minded American ladies were quite as egoistical as the Austrians

Thus the transformations of instinct on which our cultural adaptability is based may also be permanently or temporarily undone by the experiences of life Undoubtedly the influences of war are among the forces that can bring about such regression therefore we need not deny adaptability for culture to all who are at the present time displaying uncivilized behaviour and we may anticipate that the refinement of their instincts will be restored in times of peace

There is however another symptom in our world compatriots which has perhaps astonished and shocked us no less than the descent from their ethical nobility which has so greatly distressed us I mean the narrow mindedness shown by the best intellects their obduracy their inaccessibility to the most forcible arguments their uncritical credulity for the most disputable assertions This indeed presents a lamentable picture and I wish to say emphatically that in this I am by no means a bl nd partisan who finds all the intellectual hort comings on one side But this phenomenon is much easier to account for and much less disquieting than that which we have just considered Students of human nature and philosophers have long taught us that we are mistaken in regarding our intell gence as an independent force and in overlooking its depend

is connected This sensitiveness of ours is of course impotent to arrest the hand of death when it has fallen we are always deeply affected as if we were prostrated by the overthrow of our expectations Our habit is to lay stress on the fortuitous causation of the death —accident disease infection advanced age in this way we betray our endeavour to modify the significance of death from a necessity to an accident A multitude of simultaneous deaths appears to us exceedingly terrible Toward the dead person himself we take up a special attitude something like admiration for one who has accomplished a very difficult task We suspend criticism of him overlook his possible misdoings issue the command *De mortuis nil nisi bene* and regard it as justifiable to set forth in the funeral oration and upon the tombstone only that which is most favourable to his memory Consideration for the dead who no longer need it is dearer to us than the truth and certainly for most of us is dearer also than consideration for the living

The culmination of this conventional attitude towards death among civilized persons is seen in our complete collapse when death has fallen on some person whom we love—a parent or a partner in marriage a brother or sister a child a dear friend Our hopes our pride our happiness lie in the grave with him we will not be consoled we will not fill the loved one s place We behave then as if we belonged to the tribe of the Asra who must die too when those die whom they love

But this attitude of ours towards death has a powerful effect upon our lives Life is impoverished it loses in interest when the highest stake in the game of living life itself may not be risked It becomes as flat as superficial as one of those American flirtations in which it is from the first understood that nothing is to happen contrasted with a Continental love affair in which both partners must constantly bear in mind the serious consequences Our ties of affection the unbearable intensity of our grief make us disinclined to court danger for ourselves and for those who belong to us We dare not contemplate a great many undertakings which are dangerous but quite indispensable such as attempts at mechanical flight expeditions to far countries experiments with explosive substances We are paralysed by the thought of who is to replace the son with his mother the husband with his wife the father with his children if there should come disaster The tendency to exclude death from our calculations brings in its train a number of other renunciations and exclusions And yet the motto of the Hanseatic League declared *Navigare necesse est vivere non necesse'!* (It is necessary to sail the seas it is not necessary to live)

It is an inevitable result of all this that we should seek in the world of fiction of general literature and of the theatre compensation for the impoverishment of life There we still find people who know how to die indeed who are even capable of killing someone else There alone too we can enjoy the condition which makes it possible for us to reconcile ourselves with death—namely that behind all the vicissitudes of life we preserve our existence intact. For it is indeed too sad that in life it should be as it is in chess when one false move may lose us the game but with the difference that we can have no second game no return match In the realm of fiction we discover that plurality of lives for which we crave We die in the person of a given hero yet we survive him and are ready to die again with the next hero just as safely

It is evident that the war is bound to sweep away this conventional treatment of death. Death will no longer be denied we are forced to believe in him People really are dying and now not one by one but many at a time often ten thousand in a single day Nor is it any longer an accident To be sure it still seems a matter of chance whether a particular bullet hits this man or that but the survivor may easily be hit by another bullet and the accumulation puts an end to the impression of accident Life has in truth become interesting again it has regained its full significance

Here a distinction should be made between two groups—those who personally risk their lives in battle and those who have remained at home and have only to wait for the loss of their dear ones by wounds disease or infection It would indeed be very interesting to study the changes in the psychology of the combatants but I know too little about it We must stop short at the second group to which we ourselves belong I have said already that in my opinion the bewilderment and the paralysis of energies now so generally felt by us are essentially determined in part by the circumstance that we cannot maintain our former attitude towards death and have not yet discovered a new one Perhaps it will assist us to do this if

[1] Say nothing but good of the dead —ED

when the lust for killing was in the blood as possibly it is to this day with ourselves. The ethical strivings of mankind, of which we need not in the least depreciate the strength and the significance, are an acquisition accompanying evolution; they have then become the inherited possession of those human beings alive today, though unfortunately only in a very uneven measure.

Let us now leave the primitive man, and turn to the unconscious in our own mental life. Here we depend entirely upon the psycho-analytic method of investigation, the only one which plumbs such depths. We ask what is the attitude of our unconscious towards the problem of death. The answer must be: Almost exactly the same as primitive man's. In this respect, as in many others, the man of prehistoric ages survives unchanged in our unconscious. Thus our unconscious does not believe in its own death; it behaves as if immortal. What we call our *unconscious* (the deepest strata of our minds, made up of instinctual impulses) knows nothing whatever of negatives or of denials—contradictories coincide in it—and so it knows nothing whatever of our own death, for to that we can give only a negative purport. It follows that no instinct we possess is ready for a belief in death. This is even perhaps the secret of heroism. The rational explanation for heroism is that it consists in the decision that the personal life cannot be so precious as certain abstract general ideals. But more frequent, in my view, is that instinctive and impulsive heroism which knows no such motivation, and flouts danger in the spirit of Anzengruber's Hans the Road-Mender: "Nothing can happen to me." Or else that motivation serves but to clear away the hesitation which might delay an heroic reaction in accord with the unconscious. The dread of death, which dominates us oftener than we know, is on the other hand something secondary, being usually the outcome of the sense of guilt.

On the other hand, for strangers and for enemies, we do acknowledge death, and consign them to it quite as readily and unthinkingly as did primitive man. Here there does, indeed, appear a distinction which in practise shows itself decisive. Our unconscious does not carry out the killing; it merely thinks it and wishes it. But it would be wrong entirely to depreciate this psychical reality as compared with actual reality. It is significant and pregnant enough. In our unconscious we daily and hourly deport all who stand in our way, all who have offended or injured us. The expression "Devil take him!" which so frequently comes to our lips in joking anger, and which really means "Death take him!" is in our unconscious an earnest deliberate death-wish. Indeed our unconscious will murder even for trifles; like the ancient Athenian Law of Draco, it knows no other punishment for crime than death; and this has a certain consistency, for every injury to our almighty and autocratic ego is at bottom a crime of *lèse-majesté*.

And so, if we are to be judged by the wishes in our unconscious, we are, like primitive man, simply a gang of murderers. It is well that all these wishes do not possess the potency which was attributed to them by primitive men; in the cross-fire of mutual maledictions mankind would long since have perished, the best and wisest of men and the loveliest and fairest of women with the rest.

Psycho-analysis finds little credence among laymen for assertions such as these. They reject them as calumnies which are confuted by conscious experience, and adroitly overlook the faint indications through which the unconscious is apt to betray itself even to consciousness. It is therefore relevant to point out that many thinkers who could not have been influenced by psycho-analysis have quite definitely accused our unspoken thoughts of a readiness, heedless of the murder-prohibition, to get rid of anyone who stands in our way. From many examples of this I will choose one very famous one.

In *Le Père Goriot* Balzac alludes to a passage in the works of J. J. Rousseau where that author asks the reader what he would do if—without leaving Paris and of course without being discovered—he could kill, with great profit to himself, an old mandarin in Peking by a mere act of the will. Rousseau implies that he would not give much for the life of this dignitary. "*Tuer son mandarin*" has passed into proverb for this secret readiness even on the part of ourselves today.

There is as well a whole array of cynical jests and anecdotes which testify in the same sense, such as, for instance, the remark attributed to a husband: "If one of us dies, I shall go and live in Paris." Such cynical jokes would not be possible unless they contained an unacknowledged verity which could not be countenanced if seriously and baldly expressed. In joke—we know—even the truth may be told.

See "The Omnipotence of Thought," *Totem and Taboo*.

"To kill his mandarin."—ED.

one s corpse he invented ghosts and it was his sense of guilt at the satisfaction mingled with his sorrow that turned these new born pirits into evil dreaded demons The changes wrou ht by death sug ested to him the disjunction of the individuality into a body and a soul—first of all into several souls in this way his train of thought ran parallel with the process of dis integration which sets in with death The en during remembrance of the dead became the basis for assuming other modes of existence gave him the conception of life continued after apparent death

These ubsequent modes of existence were at first no more than appendages to that life which death had brought to a close—shadowy empty of content and until later times but sli htly valued they showed as yet a pathetic inadequacy We may recall the answer made to Odv eu by the soul of Achilles

Erst in tl e life on the earth no less than a god we revered th e
Il e the Achaeans and now in the realm of the dead as a monarch
Here dost tl ou rule then why should death thus grie e thee Achilles?
Thus did I speak forthwith then answering thus he addressed me
Speak not smoothly of death I beseech O fa mous Odysseus
Better by far to remain on the earth as the thrall of another
E en of a portionless man tl at hath means right scanty of living
Rather than reign sole king in the realm of the bodiless phantoms

Or in the powerful bitterly burlesque render ing by Heine where he makes Achilles say that the most insi nificant little Philistine at Stuckert-on the Neckar in being alive is far h ppier than he the son of Peleus the dead hero the prince of shadows in the nether world

It was not until much later that the different religions devised the view of this after life as the more desirable the truly valid one and de graded the life which is ended h d

s imation all with the purpose of depriving death of its meaning as the termi nation of life So early did the denial of death which above we de i nated a convention of civilization actually originate

Beside the corpse of the beloved were gen erated not only the idea of the soul the belief in immortality and a great part of man s deep-rooted sen e of guilt but also the earliest ink ling of ethical law The first and most porten tous prohibition of the awakening conscience was Tl ou shalt not kill It was born of the reaction against that hate gratification which lurked behind the grief for the loved dead nd was gradually extended to unloved strangers and finally even to enemies

This final extension is no lon er experienced by civilized man When the frenzied conflict of this war shall have been decided every one of the victorious warriors will joyfully return to his home his wife and hi children undelayed and undisturbed by any thou ht of the enemy he has slain either at clo e quarter or by dis tant weapons of destruction It i worthy of note that such primitive races as still inhabit the earth who are undoubtedly clo er than we to primitive man act differently in this re pect or did so act until they came under the influ ence of our civilization The savage—Austral ian Bushman Tierra del Fuegan—is by no means a remorseless murderer when he re turns victorious from the war path he may not set foot in his villa e nor touch h s wife until he has atoned for the murders committed in war by penances which are often prolon ed and toilsome This may be presumed of course to be the outcome of superstition the av ge till goes in fear of the avenging spirits of the lain But the spirits of the fallen enemy are nothing but the expre sion of his own conscience un easy on account of his blood guiltiness be hind this superstition lurk a vein of e hical sensitiveness which has been lo t by u civi lized men

Pious souls who cheri h the thought of our remoteness from whatever is evil and base will be quick to draw from the early appearance and the urgency of the prohibition of murder gratifyin conclusions in re ard to the force of these ethical stirrin s which must consequentl have been implanted in us Unfortunately this argument proves even more for the oppo ite contention So powerful a prohibition can only be directed against an equally powerful im pul e What no human soul de ires there is no need to prohibit it is automatically excluded The very emphasis of the commandment *Tl o i shalt not kill* makes it certain that ve pr n from an endless ancestry of murderers with

Chris ia Grabbe *H b l J aus der W lt werd wir ht f llen H r nd mal darin.* Source d igin.—ED.

As for primitive man so also for us in our unconscious there arises a case in which the two contrasted attitudes towards death that which acknowledges it as the annihilation of life and the other which denies it as ineffectual to that end conflict and join issue—and this case is the same as in primitive ages—the death or the endangered life of one whom we love a parent or partner in marriage a brother or sister a child or dear friend These loved ones are on the one hand an inner possession an ingredient of our personal ego but on the other hand are partly strangers even enemies With the exception of only a very few situations there adheres to the tenderest and closest of our affections a vestige of hostility which can excite an unconscious death wish But this conflict of ambivalence does not now as it did then find issue in theories of the soul and of ethics but in neuroses which afford us deep insight into normal mental life as well How often have those physicians who practise psycho analysis had to deal with the symptom of an exaggeratedly tender care for the well being of relatives or with entirely unfounded self reproaches after the death of a loved person The study of these cases has left them in no doubt about the extent and the significance of unconscious death wishes

The layman feels an extraordinary horror at the possibility of such feelings and takes this repulsion as a legitimate ground for disbelief in the assertions of psycho analysis I think mistakenly No depreciation of our love is intended and none is actually contained in it It is indeed foreign to our intelligence as also to our feelings thus to couple love and hate but Nature by making use of these twin opposites contrives to keep love ever vigilant and fresh so as to guard it against the hate which lurks behind it It might be said that we owe the fairest flowers of our love life to the reaction against the hostile impulse which we divine in our breasts

To sum up Our unconscious is just as inaccessible to the idea of our own death as murderously minded towards the stranger as divided or ambivalent towards the loved as was man in earliest antiquity But how far we have moved from this primitive state in our conventionally civilized attitude towards death!

It is easy to see the effect of the impact of war on this duality It strips us of the later accretions of civilization and lays bare the primal man in each of us It constrains us once more to be heroes who cannot believe in their own death it stamps the alien as the enemy whose death is to be brought about or desired it counsels us to rise above the death of those we love But war is not to be abolished so long as the conditions of existence among the nations are so varied and the repulsions between peoples so intense there will be must be wars The question then arises Is it not we who must give in who must adapt ourselves to them? Is it not for us to confess that in our civilized attitude towards death we are once more living psychologically beyond our means and must reform and give truth its due? Would it not be better to give death the place in actuality and in our thoughts which properly belongs to it and to yield a little more prominence to that unconscious attitude towards death which we have hitherto so carefully suppressed? This hardly seems indeed a greater achievement but rather a backward step in more than one direction a regression but it has the merit of taking somewhat more into account the true state of affairs and of making life again more endurable for us To endure life remains when all is said the first duty of all living beings Illusion can have no value if it makes this more difficult for us

We remember the old saying *Si vis pacem para bellum* If you desire peace prepare for war

It would be timely thus to paraphrase it *Si vis vitam para mortem* If you would endure life be prepared for death.

lowest. Yet we st'll find all the mple forms alive today Th great saurians are extinct and ha e m de way for the mammals but a t p cal representat e of th m the crocod le is till living among us The analogy may be too remote and t is also weakened by the fact that the surviving l wer species are n t as a rule the true a cestors of the present-day more highly developed types. The intermediate members ha mostly d ed ou nd are known to s only thro gh econstru tion In the realm of mind, on the other hand the prim tive t pe is so commonly preserved alongs de the transf rmat ons which ha e de eloped out of it that t is superfluous to g e in tances in proof of it. When this happens t i u ually the result of a bifurcat n in development One quantit tive part of an att tud r an impu has surv ved unchan ed wh le another has undergone further dev lopment

This brings us very close to the mo e general problem of conserva on in the mind which ha so fa hardl been d scus ed but is so interesting d important that we may take the opportun ty to pay it ome ttent on even though relevance is not immediate Since the t m when we recognized the rro f upholding tha ordinary forgetting sign fied destructi a nihilation f the mem ry trace we ha been lned t the oppos t ew that nothing one f rmed th m d could ever perish, that everythi urvi es in some w o the and is capable und r certain cond tions f bei b ought t light ga n, as f instan e when regres on extends b ck f en ugh One might try t pictu e t ones lf w s this a umption signifie by c mparis n taken f om an the fi ld. itself clearly and sharply outlined and delimited There is only one state of mind in wh h f l nd n it oi being in love threatens to obliterate the boundaries between ego and object Against all the evidence of his s nses the man in love declares that he and his be loved are one and is prepared to behave as if it were a fact A thing that can be temporarily effaced by a physiological function must also of cour e be liable to disturbance by morbid processes From pathology we have come to know a large number of states in which the boundary line between ego and outer world be come uncertain or in which they are actually incorrectly perceived—cases in which parts of a man s own body even component parts of his own mind perceptions thou hts feelings appear to him alien and not belonging to him self other cases in which a man ascribes to the external world thin s that clearly originate in himself and that ought to be acknowledged by him So the ego s co nizance of itself is sub ject to disturbance and the boundaries between it and the outer world are not immovable

Further reflection shows that the adult s ense of hi own ego cannot have been the same from the beginning It must have und rgone a de velopment which naturally cannot be demon strated but which admits of reconstruction with a fair de ree of probability When the infant at the breast receives stimuli he cannot as yet distinguish whether they come from his ego or from the outer world He learns it grad ually as the result of various exigencies It must make the stron est impression on him that many sources of excitation which later on he will recognize as hi own bodily organs can provide him at any time with sensations wherea others become temporarily out of his reach—amongst these what he wants most of all his mother s breast—and reappear only as a result of his cries for help Thus an *object* first presents itself to the ego as something ex isting *outside* which is only induced to appear by a particular act A further stimulus to the growth and formation of the ego so that it be comes something more than a bundle of sensa tions i e recognizes an *outside* the external world is afforded by the frequent unavoidable and manifold pains and unpleasant sensations which the pleasure principle still in unre stricted domination bids it abolish or avoid The tendency arises to di ociate from the e o everything which can give ri e to pain to cast it out and create a pure pleasure ego in con trast to a threatenin outside not self The limits of this primitive pleasure e o cannot escape readjustment through experience Much that the individual wants to retain becau e it is pleasure iving i nevertheless part not of the e o but of an object and much that he wishes to eject because it torments him yet proves to be inseparable from the ego arising from an inner source He learns a method by which through deliberate use of the ensory organs and suitable mu cular movements he can distinguish between internal and external —what is part of the ego and what ori inates in the outer world—and thus he makes the fir t step towards the introduction of the reality principle which is to control his development further This capacity for distinguishing which he learns of course serves a practical purpose that of enabling him to defend himself again t painful sen ations felt by him or threatening him Against certain painful excitations from within the ego has only the same means of defence as that employed a ainst pain coming from without and this is the starting point of important morbid disturbances

In this way the ego detaches itself from the external world It is more correct to ay Originally the ego includes everything later it detaches from itself the external world The ego feelin we are aware of now is thus only a shrunken vesti e of a far more exten sive feelin —a feeling which embraced the universe and expressed an inseparable con nection of the ego with the external world If we may suppose that thi primary ego-feelin has been preserved in the mind of many people—to a greater or lesser extent—it would co exist like a sort of counterpart with the narrower and more sharply outlined ego feeling of maturity and the ideational content belonging to it would be precisely the notion of limitless extension and oneness with the universe—the same feeling as that de scribed by my friend as oceanic But have we any right to assume that the original type of feelin survives along ide the later one which has developed from it?

Undoubtedly we have there is nothing un usual in such a phenomenon whether in the psychological or in other spheres Where ani mal are concerned we hold the view that the most highly developed have arisen from the

nerva and the old temple over which it was built And the observer would need merely to shift the focus of his eyes perhaps or change his position in order to call up a view of either the one or the other

There is clearly no object in spinning this fantasy further it leads to the inconceivable *or even to absurdities* *If* we try to represent his torical sequence in spatial terms it can only be done by juxtaposition in space the same space will not hold two contents Our attempt seems like an idle game it has only one justification it shows us how far away from mastering the idiosyncrasies of mental life we are by treating them in terms of visual representation

There is one objection thou h to which we must pay attention It questions our choosing *in particular the past history* of a *city* to liken to the past of the mind Even for mental life our assumption that everything past is pre served holds good only on condition that the organ of the mind remains intact and its structure has not been injured by traumas or inflammation Destructive influences compara ble to these morbid agencies are never lack ing in the history of any town even if it has had a less chequered past than Rome even if like London it has hardly ever been pillaged by an enemy Demolitions and the erection of new buildings in the place of old occur in cities which have had the most peaceful existence therefore a town is from the outset unsuited for the comparison I have made of it with a mental organism

We admit this objection we will abandon our search for a striking effect of contrast and turn to what is after all a closer object of comparison the body of an animal or human being But here too we find the same thing The early stages of development are in no sense still extant they have been absorbed into the later features for which they supplied the material The embryo cannot be demon strated in the adult the thymus gland of child hood is replaced after puberty by connective tissue but no longer exists itself in the mar row bone of a grown man I can it is true trace the outline of the childish bone structure but this latter no longer survives in itself—it lengthened and thickened until it reached its final form The fact is that a survival of all the early stages alongside the final form is only possible in the mind and that it is im possible for us to represent a phenomenon of this kind in visual terms

Perhaps we are going too far with this con clusion Perhaps we ought to be content with the assertion that what is past in the mind *can* survive and need not necessarily perish. It is always possible that even in the mind much that is old may be so far obliterated or absorbed—whether normally or by way of exception—that it cannot be restored or re animated by any means or that survival of it is always connected with certain favourable conditions It is possible but we know nothing about it We can only be sure that it is more the rule than the exception for the past to survive in the mind

Thus we are entirely willing to acknowledge that the oceanic feeling exists in many people and we are disposed to relate it to an early sta e in ego feeling the further question then arises what claim has this feeling to be re arded as the source of the need for religion

To me this claim does not seem very for cible Surely a feeling can only be a source of energy when it is itself the expression of a strong need The derivation of a need for religion from the child s feeling of helplessness and the longing it evokes for a father seems to me incontrovertible especially since this feel ing is not simply carried on from childhood days but is kept alive perpetually by the fear of what the superior power of fate will bring I could not point to any need in childhood so strong as that for a father s protection Thus the part played by the oceanic feeling which I suppose seeks to reinstate limitless narcis sism cannot possibly take the first place The derivation of the religious attitude can be followed back in clear outline as far as the child s feeling of helplessness There may be something else behind this but for the present it is wrapped in obscurity

I can imagine that the oceanic feeling could become connected with religion later on That feeling of oneness with the universe which is its ideational content sounds very like a first attempt at the consolations of religion like another way taken by the ego of denying the dangers it sees threatening it in the external world I must again confess that I find it very difficult to work with these in tangible quantities Another friend of mine whose insatiable scientific curiosity has im pelled him to the most out-of the way re searches and to the acquisition of encyclo-paedic knowledge has assured me that the Yogi by their practices of withdrawal from the world concentrating attention on bodily func tions peculiar methods of breathing actually

pain are tho e wh h aim an influencing the organism itself I the last analysis ll pain is bu sensati n it only exists in so f r as we feel it, and we feel i only in con equence of certain characterist cs f our organism

The crudest of these methods of influencing t bod but al o the most effecti e s the chem cal one that of intoxication I *do not* think an one entirely understands their opera tion, b t it is a f ct that th re are certain substances foreign to the body which when present in the blood r tis ues d ectly cau e us p easurable ensations b t al o o chang the condi ons of our pe cepti ty that we be com nsen ble of di agree bl sensat o s The two effects t only take place simultane ously they seem to be closel bound up with ea h other B t there must be s b tances in the chemical compo tion of our bod es which can d the same, f r we kn w of at l ast one morbid state that of ma ia in wh ch a condi tion similar to th s intoxicat o ari es w th-out any drug be ng bs bed. purpose of the lives of animals unless peradventure they are designed to be of service to man But this too will not hold for with many animals man can do nothing—except describe classify and study them and countless species have declined to be put even to this use by living and dying and becoming extinct before men had set eyes upon them So again only religion is able to answer the question of the purpose of life One can hardly go wrong in concluding that the idea of a purpose in life stands and falls with the religious system

We will turn therefore to the less ambitious problem what the behaviour of men themselves reveals as the purpose and object of their lives what they demand of life and wish to attain in it The answer to this can hardly be in doubt they seek happiness they want to become happy and to remain so There are two sides to this striving a positive and a negative it aims on the one hand at eliminating pain and discomfort on the other at the experience of intense pleasures In its narrower sense the word *happiness* relates only to the last Thus human activities branch off in two directions—corresponding to this double goal—according to which of the two they aim at realizing either predominantly or even exclusively

As we see it is simply the pleasure principle which draws up the programme of life s purpose This principle dominates the operation of the mental apparatus from the very beginning there can be no doubt about its efficiency and yet its programme is in conflict with the whole world with the macrocosm as much as with the microcosm It simply cannot be put into execution the whole constitution of things runs counter to it one might say the intention that man should be *happy* is not included in the scheme of *Creation* What is called *happiness* in its narrowest sense comes from the satisfaction—most often instantaneous—of pent up needs which have reached great intensity and by its very nature can only be a transitory experience When any condition desired by the pleasure principle is protracted it results in a feeling only of mild comfort we are so constituted that we can only intensely enjoy contrasts much less intensely states in themselves Our possibilities of happiness are thus limited from the start by our very constitution It is much less difficult to be unhappy Suffering comes from three quarters from our own body which is destined to decay and dissolution and cannot even dispense with anxiety and pain as danger signals from the outer world which can rage against us with the most powerful and pitiless forces of destruction and finally from our relations with other men The unhappiness which has this last origin we find perhaps more painful than any other we tend to regard it more or less as a gratuitous addition although it cannot be any less an inevitable fate than the suffering that proceeds from other sources

It is no wonder if under the pressure of these possibilities of suffering humanity is wont to reduce its demands for happiness just as even the pleasure principle itself changes into the more accommodating reality principle under the influence of external environment if a man thinks himself happy if he has merely escaped unhappiness or weathered trouble if in general the task of avoiding pain forces that of obtaining pleasure into the background Reflection shows that there are very different ways of attempting to perform this task and all these ways have been recommended by the various schools of wisdom in the art of life and put into practice by men Unbridled gratification of all desires forces itself into the foreground as the most alluring guiding principle in life but it entails preferring enjoyment to caution and penalizes itself after short indulgence The other methods in which avoidance of pain is the main motive are differentiated according to the source of the suffering against which they are mainly directed Some of these measures are extreme and some moderate some are one sided and some deal with several aspects of the matter at once Voluntary loneliness isolation from others is the readiest safeguard against the unhappiness that may arise out of human relations We know what this means the happiness found along this path is that of peace Against the dreaded outer world one can defend oneself only by turning away in some other direction if the difficulty is to be solved single handed There is indeed another and better way that of combining with the rest of the human community and taking up the attack on nature thus forcing it to obey human will under the guidance of science One is working then with all for the good of all But the most interesting methods for averting

rather it pa es that by heedles.lv and holds fast to th deep-rooted passionate stri ing for a positive fulfilment of happiness Perhaps it reall comes nearer to this goal than any other method. I am speaking of course of that way of life which makes lo e the centre of all things and ant cipates all happiness from loving and being loved This att tude is fam l iar enough to all of us o e of the forms in which l e manifests itself sexual lo e gi es us our most intense experience of an o er elming pleasurable sen ation a d so fur nishes a p ototype f r ou stri ngs after happiness. What is m e natural than that we should persi t in seeking happ ness along the path by which we first encountered it? The weak de of this way of living is clearly evi dent and were it not for this no human being would ever h ve thought of abandon ng this path to happiness in f our of any oth r We re ever o d fenceless against suffering as hen we lo e eve so forlornly unhappy as when w ha lo t our love-object or ts lov B t this does not complete the story of that way of life which bases happiness on lov th re is much more to be sa d about it

We may here go on to cons der the inter esting case in which happiness life is sought

hardly ever regarded as beautiful the qual ty of beauty eems on the other hand to attach to certa n econd ry sexual characters

In p te of the incompleteness of these con s derat o s I w'll enture on a few remarks in conclusion of this d cussion The goal towards wh ch the pleasure principle impels us —of becoming hap y— s not atta nable yet we may not—nay cannot—gi e up the effort to come nearer to realization of it by some mean or other Very d fferent paths m y be taken towards it some pursue the posit e aspect of the a m atta nment of p ea ure others the negat ve a oidance of pa n By none of these ways can we ach eve all that we desire In th t mod fied sense in whi h

It presupposes special gifts and dispositions which are not very commonly found in a sufficient degree And even to these few it does not secure complete protection against suffering it gives no invulnerable armour against the arrows of fate and it usually fails when a man s own body becomes a source of suffering to him

This behaviour reveals clearly enough its aim—that of making oneself independent of the external world by looking for happiness in the inner things of the mind in the next method the same features are even more marked The connection with reality is looser still satisfaction is obtained through illusions which are recognized as such without the discrepancy between them and reality being allowed to interfere with the pleasure they give These illusions are derived from the life of phantasy which at the time when the sense of reality developed was expressly exempted from the demands of the reality test and set apart for the purpose of fulfilling wishes which would be very hard to realize At the head of these phantasy pleasures stands the enjoyment of works of art which through the agency of the artist is opened to those who cannot themselves create Those who are sensitive to the influence of art do not know how to rate it high enough as a source of happiness and consolation in life Yet art affects us but as a mild narcotic and can provide no more than a temporary refuge for us from the hardships of life its influence is not strong enough to make us forget real misery

Another method operates more energetically and thoroughly it regards reality as the source of all suffering as the one and only enemy with whom life is intolerable and with whom therefore all relations must be broken off if one is to be happy in any way at all The hermit turns his back on this world he will have nothing to do with it But one can do more than that one can try to re create it try to build up another instead from which the most unbearable features are eliminated and replaced by others corresponding to one s own wishes He who in his despair and defiance sets out on this path will not as a rule get very far reality will be too stron for him He becomes a madman and usually finds no one to help him in carrying throu h his delusion It is said however that each one of us behaves in some respect like the paranoiac substituting a wish fulfilment for some aspect of the world which is unbearable to him and carrying this delusion through into reality When a large number of people make this attempt together and try to obtain assurance of happiness and protection from suffering by a delusional transformation of reality it acquires special significance The religions of humanity too must be classified as mass delusions of this kind Needless to say no one who shares a delusion recognizes it as such

I do not suppose that I have enumerated all the methods by which men strive to win happiness and keep suffering at bay and I know too that the material might have been arran ed differently One of these methods I have not yet mentioned at all—not because I had forgotten it but because it will interest us in another connection How would it be possible to forget this way of all others of practising the art of life! It is conspicuous for its remarkable capacity to combine characteristic features Needless to say it too strives to bring about independence of fate—as we may best call it—and with this object it looks for satisfaction within the mind and uses the capacity for displacing libido which we mentioned before but it does not turn away from the outer world on the contrary it takes a firm hold of its objects and obtains happiness from an emotional relation to them Nor is it content to strive for avoidance of pain—that goal of weary resignation

and whose libido components do not go through the transformation and modification necessary for uccessful achievement in later life will find it hard to obtain happiness from his exter nal environment especially if he is faced with the more difficult tasks One last possibility of dealing with life remains to such people and it offers them at least substitute gratifications it takes the form of the flight into neurotic illness and they mostly adopt it while they are still young Those who e efforts to obtain hap piness come to nou ht in later years still find consolation in the pleasure of chronic intoxica tion or else they embark upon that despairing attempt at revolt—psychosis

Religion circumscribes the e measures of choice and adaptation by urging upon everyone alike its single way of achieving happiness and guarding against pain Its method consists in decrying the value of life and promulgating a view of the real world that is distorted like a delusion and both of these imply a preliminary intimidating influence upon intelligence At such a cost—by the forcible imposition of men tal infantilism and inducing a mass-delusion—religion succeeds in saving many people from individual neuroses But little more There are as we have said many paths by which the hap piness attainable for man can be reached but none which is certain to take him to it Nor can religion keep her promises either When the faithful find themselves reduced in the end to speaking of God s *inscrutable decree* they thereby avow that all that is left to them in their sufferings is unconditional submission as a last remaining consolation and source of hap piness And if a man is willing to come to this he could probably have arrived there by a shorter road

III

OUR discussion of happiness has so far not taught us much that is not already common knowledge Nor does the prospect of discover ing anything new seem much greater if we go on with the problem of why it is so hard for mankind to be happy We gave the answer before when we cited the three sources of human sufferings namely the superior force of nature the disposition to decay of our bodies and the inadequacy of our methods of regulating human relations in the family the community and the state In regard to the first two our judg ment cannot hesitate it forces us to recognize the e sources of suffering and to submit to the inevitable We shall never completely subdue nature our body too is an organism itself a part of nature and will always contain th seeds of dissolution with its limited power of adaptation and achievement The effect of this reco nition is in no way disheartening on the contrary it points out the direction for our efforts If we cannot abolish all ufferin yet a great deal of it we can and can miti ate more the experience of several thousand years has convinced us of this To the third the social source of our distres es we take up a different attitude We prefer not to re ard it as one at all we cannot see why the systems we have ourselves created should not rather ensure protection and well being for us all To be sure when we consider how unsuccessful our efforts to safeguard a ainst sufferin in this particular have proved the su picion dawns upon us that a bit of unconquerable nature lurks concealed behind this difficulty as well—in the shape of our own mental constitution

When we start to consider this pos ibility we come across a point of view which is so amazing that we will pause over it According to it our so called civilization itself is to blame for a great part of our misery and we should be much happier if we were to give it up and go back to primitive conditions I call this amaz ing because—however one may define culture—it is undeniable that every means by which we try to guard ourselves against menaces from the several sources of human distress is a part of this same culture

How has it come about that so many people have adopted this strange attitude of ho tility to civilization? In my opinion it arose from a background of profound long standing discon tent with the existing state of civilization which finally crystallized into this judgment as a result of certain historical happenings I be lieve I can identify the last two of these I am not learned enou h to trace the links in the chain back into the history of the human pe cies At the time when Christianity conquered the pagan religions some such antagonism to culture must already have been actively at work It is clo ely related to the low estimation put upon earthly life by Christian doctrine The earlier of the last two historical develop ments was when as a result of voyages of discovery men came into contact with primi tive peoples and races To the Europeans who failed to observe them carefully and misunder stood what they saw these people eemed to lead simple happy lives—wanting for nothing—such as the travellers who visited them with

suffering have to be endured special mental protective devices come into operation It seems to me unprofitable to follow up this aspect of the problem further

It is time that we should turn our attention to the nature of this culture the value of which is so much disputed from the point of view of happiness Until we have learnt something by examining it for ourselves we will not look round for formulas which express its essence in a few words We will be content to repeat that the word *culture* describes the sum of the achievements and institutions which differentiate our lives from those of our animal forebears and serve two purposes namely that of protecting humanity against nature and of regulating the relations of human beings among themselves In order to learn more than this we must bring together the individual features of culture as they are manifested in human communities We shall have no hesitation in allowing ourselves to be guided by the common usages of language or as one might say the *feeling* of language confident that we shall thus take into account inner attitudes which still resist expression in abstract terms

The beginning is easy We recognize as belonging to culture all the activities and possessions which men use to make the earth serviceable to them to protect them against the tyranny of natural forces and so on There is less doubt about this aspect of civilization than any other If we go back far enough we find that the first acts of civilization were the use of tools the gaining of power over fire and the construction of dwellings Among these the acquisition of power over fire stands out as a quite exceptional achievement without a prototype while the other two opened up paths which have ever since been pursued by man the stimulus towards which is easily imagined By means of all his tools man makes his own organs more perfect—both the motor and the sensory—or else removes the obstacles in the way of their activity Machinery places gigantic power at his disposal which like his muscles he can employ in any direction ships and aircraft have the effect that neither air nor water can prevent his traversing them With spectacles he corrects the defects of the lens in his own eyes with telescopes he looks at far distances with the microscope h — the I m of hi has c sitory p ssions just as the gramophone does with equally transient auditory ones both are at bottom materializations of his own power of memory With the help of the telephone he can hear at distances which even fairy tales would treat as insuperable writing to begin with was the voice of the absent dwellings were a substitute for the mother s womb that first abode in which he was safe and felt so content for which he probably yearns ever after

It sounds like a fairy tale but not only that this story of what man by his science and practical inventions has achieved on this earth where he first appeared as a weakly member of the animal kingdom and on which each individual of his species must ever again appear as a helpless infant—O inch of nature!—is a direct fulfilment of all or of most of the dearest wishes in his fairy tales All these possessions he has acquired through culture Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods Whatever seemed unattainable to his desires—or forbidden to him—he attributed to these gods One may say therefore that these gods were the ideals of his culture Now he has himself approached very near to realizing this ideal he has nearly become a god himself But only it is true in the way that ideals are usually realized in the general experience of humanity Not completely in some respects not at all in others only by halves Man has become a god by means of artificial limbs so to speak quite magnificent when equipped with all his accessory organs but they do not grow on him and they still give him trouble at times

is one feature of culture which characterizes it better than any other and that is the value it sets upon the higher mental activities—intellectual scientific and aesthetic achievement—the leading part it concedes to ideas in human life First and foremost among these ideas come the religious systems with their complicated evolution on which I have elsewhere endeavoured to throw a light next to them come philosophical speculations and last the ideals man has formed his conceptions of the perfection possible in an individual in a people in humanity as a whole and the demands he makes on the basis of these conceptions These creations of his mind are not independent of each other on the contrary they are closely interwoven and this complicates the attempt to describe them as well as that to trace their psychological derivation If we assume as a general hypothesis that the force behind all human activities is a striving toward the two convergent aims of profit and pleasure we must then acknowledge this as valid also for these other manifestations of culture although it can be plainly recognized as true only in respect of science and art It cannot be doubted however that the remainder too correspond to some powerful need in human beings—perhaps to one which develops fully only in a minority of people Nor may we allow ourselves to be misled by our own judgments concerning the value of any of these religious or philosophical systems or of these ideals whether we look upon them as the highest achievement of the human mind or whether we deplore them as fallacies one must acknowledge that where they exist and especially where they are in the ascendant they testify to a high level of civilization

We now have to consider the last and certainly by no means the least important of the components of culture namely the ways in which social relations the relations of one man to another are regulated all that has to do with him as a neighbour a source of help a sexual object to others a member of a family or of a state It is especially difficult in this matter to remain unbiased by any ideal standards and to ascertain exactly what is specifically cultural here Perhaps one might begin with the statement that the first attempt ever made to regulate these social relations already contained the essential element of civilization Had no such attempt been made these relations would be subject to the wills of individuals that is to say the man who was physically strongest would decide things in accordance with his own interests and desires The situation would remain the same even though this strong man should in his turn meet with another who was stronger than he Human life in communities only becomes possible when a number of men unite together in strength superior to any single individual and remain united against all single individuals The strength of this united body is then opposed as *right* against the strength of any individual which is condemned as *brute force* This substitution of the power of a united number for the power of a single man is the decisive step toward civilization The essence of it lies in the circumstance that the members of the community have restricted their possibilities of gratification whereas the individual recognized no such restrictions The first requisite of culture therefore is justice—that is the assurance that a law once made will not be broken in favour of any individual This implies nothing about the ethical value of any such law The further course of cultural development seems to tend toward ensuring that the law shall no longer represent the will of any small body—caste tribe section of the population—which may behave like a predatory individual towards other such groups perhaps containing larger numbers The end result would be a state of law to which all—that is all who are capable of uniting—have contributed by making some sacrifice of their own desires and which leaves none—again with the same exception—at the mercy of brute force

The liberty of the individual is not a benefit of culture It was greatest before any culture though indeed it had little value at that time because the individual was hardly in a position to defend it Liberty has undergone restrictions through the evolution of civilization and justice demands that these restrictions shall apply to all The desire for freedom that makes itself felt in a human community may be a revolt against some existing injustice and so may prove favourable to a further development of civilization and remain compatible with it But it may also have its origin in the primitive roots of the personality still unfettered by civilizing influences and so become a source of antagonism to culture Thus the cry for freedom is directed either against particular forms or demands of culture or else against culture itself It does not seem as if man could be brought by any sort of influence to change his nature into that of the ants he will always one imagines defend his claim to individual

ently on his chosen love-object and thus ex poses him most painful sufferings if he is rejected by it or loses it through death or defection. The wise men of all ages have conse quently warned us emphatically against this way of life; but in spite of all it retains its attraction for a great number of people.

A small minority are enabled by their con stitution nevertheless to find happiness along the path of love; but far reaching mental trans formations of the erotic function are necessary before this is possible. These people make them selves independent of their objects' acquies cence by transferring the main value from the fact of being loved to their own act of loving; they protect themselves against loss of it by attaching their love not to individual objects but to all men equally, and they avoid the un certainties and disappointments of genital love by turning away from its sexual aim and modi fying the instinct into an impulse with an inhibited aim. The state which they induce in themselves by this process—an unchangeable, undeviating, tender attitude—has little super ficial likeness to the stormy, vital excitements of genital love from which it is nevertheless de rived. It seems that Saint Francis of Assisi may have carried this method of using love to pro duce an inner feeling of happiness as far as anyone; what we are thus characterizing as one of the procedures by which the pleasure-princi ple fulfils itself has in fact been linked up in many ways with religion; the connection be tween them may lie in those remote fastnesses of the mind where the distinctions between the ego and objects and between the various ob jects become matters of indifference. From one ethical standpoint, the deeper motivation of which will later become clear to us, this in clination towards an all-embracing love of oth ers and of the world at large is regarded as the highest state of mind of which man is capable. Even at this early stage in the discussion I will not withhold the two principal objections we have to raise against this view. A love that does not discriminate seems to us to lose some of its own value, since it does an injustice to its object. And secondly, not all men are worthy of love.

The love that instituted the family still re tains its power; in its original form it does not stop short of direct sexual satisfaction, and in its modified form, as aim-inhibited friendli ness, it influences our civilization. In both these forms it carries on its task of binding men and women to one another, and it does this with greater intensity than can be achieved through the interest of work in common. The careless and undifferentiated way in which the word *love* is employed by language has its genetic justifica tion. In general, people give this name to the relation between a man and a woman whose genital desires have [illegible] but [illegible] rents [illegible] in and children, brothers and sisters, in a family is also called love, although to us this relation means the description of *aim-in hibited love* or *affection*. Love with an inhibited aim was indeed originally full sensual love and in men's unconscious minds is so still. Both of them, the sensual and the aim-inhibited forms, reach out beyond the family and create new bonds with others who before were strangers. Genital love leads to the forming of new fam ilies; aim-inhibited love to *friendships*, which are valuable culturally because they do not entail many of the limitations of genital love— for instance, its exclusiveness. But the inter relation between love and culture loses its sim plicity as development proceeds. On the one hand love opposes the interests of culture; on the other culture menaces love with grievous restrictions.

This rift between them seems inevitable; the cause of it is not immediately recognizable. It expresses itself first in a conflict between the family and the larger community to which the individual belongs. We have seen already that one of culture's principal endeavours is to cement men and women together in larger units. But the family will not give up the individual. The closer the attachment between the mem bers of it, the more they often tend to remain aloof from others and the harder it is for them to enter into the wider circle of the world at large. That form of life in common which is phylogenetically older and is in childhood its only form resists being displaced by the type that becomes acquired later with culture. De tachment from the family has become a task that awaits every adolescent, and often society helps him through it with pubertal and ini tiatory rites. One gets the impression that these difficulties form an integral part of every proc ess of mental evolution—and indeed at bot tom, of every organic development, too.

The next discord is caused by women, who soon become antithetical to cultural trends and spread around them their conservative influ ence—the women who at the beginning laid the foundations of culture by the appeal of their love. Women represent the interests of the

members of his family One may suppose that the founding of families was in some way connected with the period when the need for genital satisfaction no lon er appearing like an occasional guest who turns up suddenly and then vanishes without letting one hear any thing of him for long intervals had settled down with each man like a permanent lodger When this happened the male acquired a mo tive for keeping the female or rather his sex ual objects near him while the female who wanted not to be separated from her helpless young in their interests too had to stay by the stronger male In this primitive family one essential feature of culture is lacking the will of the father the head of it was unfettered I have endeavoured in *Totem and Taboo* to show how the way led from this family life to the succeeding phase of communal existence in the form of a band of brothers By overpowerin the father the sons had discovered that sev eral men united can be stronger than a single man The totemic stage of culture is founded upon the restrictions that the band were oblige to impose on one another in order to maintain the new system These taboos were the first *right* or law The life of human beings in com mon therefore had a twofold foundation i e the compulsion to work created by external necessity and the power of love causing the male to wish to keep his sexual object the fe male near him and the female to keep near her that part of herself which has become detached from her her child Eros and Ananke were the parents of human culture too The first re ult of culture was that a larger number of human beings could then live to ether in common. And since the two great powers were here co operating together one might have expected that further cultural evolution would have pro ceeded smoothly towards even greater mastery over the external world as well as towards greater extension in the numbers of men shar ing the life in common Nor is it easy to under stand how this culture can be felt as anything but satisfying by those who partake of it

Before we go on to enquire where the dis turbances in it arise we will let ourselves di gress from the point that love was one of the founders of culture and so fill a gap left in our previous discussion We said that man having found by experience that sexual (genital) love afforded him his greatest gratification o that it became in effect a prototype of all happiness to him must have been thereby impelled to seek his happiness further along the path of sexual relations to make genital erotism the central point of his life We went on to say that in so doing he becomes to a very dangerous degree dependent on a part of the outer world

family and sexual life the work of civilization has become more and more men's business it confronts them with ever harder tasks compels them to sublimations of instinct which women are not easily able to achieve Since man has not an unlimited amount of mental energy at his disposal he must accomplish his tasks by distributing his libido to the best advantage What he employs for cultural purposes he withdraws to a great extent from women and his sexual life his constant association with men and his dependence on his relations with them even estrange him from his duties as husband and father Woman finds herself thus forced into the background by the claims of culture and she adopts an inimical attitude towards it

The tendency of culture to set restrictions upon sexual life is no less evident than its other aim of widening its sphere of operations Even the earliest phase of it the totemic brought in its train the prohibition against incestuous object choice perhaps the most maiming wound ever inflicted throughout the ages on the erotic life of man Further limitations are laid on it by taboos laws and customs which touch men as well as women Various types of culture differ in the lengths to which they carry [illegible]

[illegible] obeys the laws of psychological economic necessity in making the restrictions for it obtains a great part of the mental energy it needs by subtracting it from sexuality Culture behaves towards sexuality in this respect like a tribe or a section of the population which has gained the upper hand and is exploiting the rest to its own advantage Fear of a revolt among the oppressed then becomes a motive for even stricter regulations A high water mark in this type of development has been reached in our Western European civilization Psychologically it is fully justified in beginning by censuring any manifestations of the sexual life of children for there would be no prospect of curbing the sexual desires of adults if the ground had not been prepared for it in childhood Nevertheless there is no sort of justification for the lengths beyond this to which civilized society goes in actually denying the existence of these manifestations which are not merely demonstrable but positively glaring Where sexually mature persons are concerned object choice is further narrowed down to the opposite sex and most of the extra genital forms of satisfaction are interdicted as perversions The standard which declares itself in these prohibitions is that of a sexual life identical for all it pays no heed to the disparities in the inborn and acquired sexual constitutions of individuals and cuts off a considerable number of them from sexual enjoyment thus becoming a cause of grievous injustice The effect of these restrictive measures might presumably be that all the sexual interest of those who are normal and not constitutionally handicapped could flow without further forfeiture into the channel left open to it But the only outlet not thus censured heterosexual genital love is further circumscribed by the barriers of legitimacy and monogamy Present day civilization gives us plainly to understand that sexual relations are permitted only on the basis of a final indissoluble bond between a man and woman that sexuality as a source of enjoyment for its own sake is unacceptable to it and that its intention is to tolerate it only as the hitherto irreplaceable means of multiplying the human race

This of course represents an extreme Everyone knows that it has proved impossible to put it into execution even for short periods Only the weaklings have submitted to such comprehensive interference with their sexual freedom and stronger natures have done so only under one compensatory condition of which mention may be made later Civilized society has seen itself obliged to pass over in silence many transgressions which by its own ordinances it ought to have penalized This does not justify anyone however in leaning toward the other side and assuming that because it does not achieve all it aims at such an attitude on the part of society is altogether harmless The sexual life of civilized man is seriously disabled whatever we may say it sometimes makes an impression of being a function in process of becoming atrophied just as organs like our teeth and our hair seem to be One is probably right in supposing that the importance of sexuality as a source of pleasurable sensations i e as a means of fulfilling the purpose of life has perceptibly decreased Sometimes one imagines one perceives that it is not only the oppression of culture but something in the nature of the function itself that denies us full satisfaction and urges us in other direc

V

PSYCHO-ANALYTIC work has shown that these frustrations in respect of sexual life are especially unendurable to the so-called neurotics among us. These persons manufacture substitute-gratifications for themselves in their symptoms which, however, are either painful in themselves or become the cause of suffering owing to the difficulties they create with the person's environment and society at large. It is easy to understand the latter fact, but the former presents us with a new problem. But culture demands other sacrifices besides that of sexual gratifications.

We have regarded the difficulties in the development of civilization as part of the general difficulty accompanying all evolution, for we have traced them to the inertia of libido, its disinclination to relinquish an old position in favour of a new one. It is much the same thing if we say that the conflict between civilization and sexuality is caused by the circumstance that sexual love is a relationship between two people, in which a third can only be superfluous or disturbing, whereas civilization is founded on relations between larger groups of persons. When a love-relationship is at its height no room is left for any interest in the surrounding world; the pair of lovers are sufficient unto themselves, do not even need the child they have in common to make them happy. In no other case does Eros so plainly betray the core of his being, his aim of making one out of many; but when he has achieved it in the proverbial way through the love of two human beings, he is not willing to go further.

From all this we might well imagine that a civilized community could consist of pairs of individuals such as this, libidinally satisfied in each other, and linked to all the others by work and common interest. If this were so, culture would not need to levy energy from sexuality. But such a desirable state of things does not exist and never has existed in actuality; culture is not content with such limited ties as these; we see that it endeavours to bind the members of the community to one another by libidinal ties as well, that it makes use of every means and favours every avenue by which powerful identifications can be created among them, and that it exacts a heavy toll of aim-inhibited libido in order to strengthen communities by bonds of friendship between the members. Restrictions upon sexual life are unavoidable if this object is to be attained. But we cannot see the necessity that forces culture

along this path and gives rise to its antagonism to sexuality It must be due to some disturbin influence not yet detected by us

We may find the clue in one of the so called *ideal standa ds* of civilized society It runs Thou shalt love thy neighbour as thyself It is world renowned undoubtedly older than Christianity which parades it as its proudest profession yet certainly not very old in his torical times men still knew nothing of it We will adopt a naive attitude towards it as if we were meeting it for the first time Thereupon we find ourselves unable to suppress a feelin of astonishment as at something unnatural Why should we do this? What good is it to us? Above all how can we do such a thing? How could it possibly be done? My love seems to me a valuable thing that I have no right to throw away without reflection It imposes obligations on me which I must be prepared to make sacrifices to fulfil If I love someone he must be worthy of it in some way or other (I am leaving out of account now the use he may be to me as well as his possible significance to me as a sexual object neither of these two kinds of relationship between us come into question where the injunction to love my neighbour is concerned) He will be worthy of it if he is so like me in important respects that I can love myself in him worthy of it if he is so much more perfect than I that I can love my ideal of myself in him I must love him if he is the son of my friend since the pain my friend would feel if anythin un toward happened to him would be my pain—I should have to share it But if he is a stranger to me and cannot attract me by any value he has in himself or any significance he may have already acquired in my emotional life it will be hard for me to love him I shall even be do ing wrong if I do for my love is valued as a privilege by all those belonging to me it is an injustice to them if I put a stranger on a level with them But if I am to love him (with that kind of universal love) simply because he too is a denizen of the earth like an insect or an earthworm or a grass snake then I fear that but a small modicum of love will fall to his lot and it would be impossible for me to give him as much as by all the laws of reason I am entitled to retain for myself What is the point of an injunction promulgated with such so lemnity if reason does not recommend it to us?

When I look more closely I find still further difficulties Not merely is this stranger on the whole not worthy of love but, to be honest I must confess he has more claim to my hos tility even to my hatred He does not seem to have the least trace of love for me does not show me the sli htest consideration If it will do him any good he has no he itation in injurin me never even asking himself whether the amount of advantage he gains by it bears any proportion to the amount of wrong done to me What is more he does not even need to get an advantage from it if he can merely get a little pleasure out of it he thinks nothin of jeering at me insultin me slandering me showin his power over me and the more e cure he feels himself or the more helpless I am with so much more certainty can I expect this behaviour from him toward me If he behaved differently if he showed me consid eration and did not molest me I should in any case without the aforesaid commandment be willing to treat him similarly If the hi h sounding ordinance had run Love thy nei h bour as thy neighbour loves thee I should not take objection to it And there is a second commandment that seems to me even more in comprehensible and arouses still stronger op position in me It is Love thine enemies When I think it over however I am wrong in treating it as a greater impo ition It is at bot tom the same thin

I imagine now I hear a voice gravely adjur ing me Just because thy nei hbour is not worthy of thy love is probably full of enmity towards thee thou shouldst love him as thy self I then perceive the case to be like that of *Credo quia absurdum*

Now it is of course very probable that my neighbour when he is commanded to love me as himself will answer exactly as I have done and reject me for the same reasons I hope he will not have the same objective grounds for doin o but he will hope so as well Even so there are variations in men s behaviour which ethics disregarding the fact that they are de termined classifies as *good* and *evil* As long as

to recognize that psychologically I
on an
pr
sio iments a strong one undoubtedly but assuredly not the strongest It in no way alters the individual differences in power and influence which are turned by aggressiveness to its own use nor does it change the nature of the instinct in any way This instinct did not arise as the result of property it reigned almost supreme in primitive times when possessions were still extremely scanty it shows itself already in the nursery when possessions have hardly grown out of their ori inal anal shape it is at the bottom of all the relations of affection and love between human beings—possibly with the single exception of that of a mother to her male child Suppose that personal rights to material goods are done away with there still remain prerog atives in sexual relationships which must arouse the trongest rancour and most violent enmity among men and women who are otherwise equal Let us suppose this were also to be re moved by instituting complete liberty in sexual life so that the family the germ cell of culture ceased to exist one could not it is true foresee the new paths on which cultural development might then proceed but one thing one would be bound to expect and that is that the in effaceable feature of human nature would follow wherever it led

Men clearly do not find it easy to do without satisfaction of this tendency to a gression that is in them when deprived of satisfaction of it they are ill at ease There is an advanta e not to be undervalued in the existence of smaller communities through which the aggressive in stinct can find an outlet in enmity towards those outside the group It is always possible to unite considerable numbers of men in love towards one another so long as there are still some remaining as objects for ag ressive mani festations I once interested myself in the peculiar fact that peoples whose territories are adjacent and are otherwise closely related are always at feud with and ridiculin each other as for instance the Spaniards and the Por tuguese the North and South Germans the English and the Scotch and so on I gave it the name of *narcissism in respect of mino differences* which does not do much to explain it One can now see that it is a convenient and relatively harmless form of satisfaction for aggressive tendencies through which cohesion amongst the members of a group is made easier The Jewish people scattered in all directions as they are have in this way rend ered services which deserve recognition to the development of culture in the countries where they settled but unfortunately not all the massacres of Jews in the Middle Ages sufficed to procure peace and security for their Chris tian contemporaries Once the apostle Paul had laid down universal love between all men as the foundation of his Christian community the inevitable consequence in Christianity was the utmost intolerance towards all who remained outside of it the Romans who had not founded their state on love were not given to lack of religious toleration although religion was a concern of the state and the state was per meated throu h and throu h with it Neither was it an unaccountable chance that the dream of a German world dominion evoked a com plementary movement towards anti-semitism and it is quite intelligible that the attempt to establish a new communi tic type of culture in Russia should find psycholo ical support in the persecution of the bourgeoi One only wonders with some concern however how the Soviets will manage when they hav exterminated their bourgeois entirely

If civilization requires such sacrifices not only of sexuality but also of the aggressive tendencies in mankind we can better under stand why it should be so hard for men to feel happy in it In actual fact primitive man was better off in this respect for he knew nothing of any re trictions on his instincts As a set off against this his prospects of enjoyin his happiness for any length of time were very slight Civilized man has exchanged some part of his chances of happines for a measure of security We will not forget however that in the primal family only the head of it enjoyed this instinctual freedom the other members lived in slavish thraldom The antithesis be tween a minority enjoying cultural advantages and a majority who are robbed of them was therefore mo t extreme in that primeval period of culture W th regard to the primitive human types living at the present time careful in

neuroses as well as many diseases bordering on the psychoses and also the latter themselves from the psycho analytic angle It was not necessary to abandon the view that the transference neuroses are attempts on the [illegible] the ego to [illegible] concept o[illegible] the ego in [illegible]ound to be libidinal as well it seemed for a time inevitable that libido should become synonymous with instinctual energy in general as C G Jung had previously advocated Yet there still remained in me a kind of conviction for which as yet there were no grounds that the instincts could not all be of the same nature I made the next step in *Beyond the Pleasure Principle* (19[illegible]0) when the repetition compulsion and the conservative character of instinctual life first struck me On the basis of speculations concerning the origin of life and of biological parallels I drew the conclusion that beside the instinct preserving the organic substance and binding it into ever larger units there must exist another in antithesis to this which would seek to dissolve these units and reinstate their antecedent inorganic state That is to say a death instinct as well as Eros the phenomena of life would then be explicable from the interplay of the two and their counteracting effects on each other It was not easy however to demonstrate the working of this hypothetical death instinct The manifestations of Eros were conspicuous and audible enough one might assume that the death instinct worked silently within the organism towards its disintegration but that of course was no proof The idea that part of the instinct became directed towards the outer world and then showed itself as an instinct of ag ression and destruction carried us a step further The instinct would thus itself have been pressed into the service of Eros in that the organism would be destroying something animate or inanimate outside itself instead of itself Conversely any cessation of this flow outwards must have the effect of intensifying the self destruction which in any case would always be going on within From this example one could then surmise that the two kinds of instincts seldom—perhaps never—appear in isolation but always mingle with each other in different very varying proportions and so make themselves unrecognizable to us Sadism long since known to us as a component instinct of sexuality would represent a particularly strong admixture of the instinct of destruction into the love impulse while its counterpart masochism would be an alliance between sexuality and the destruction at work within the self in consequence of which the otherwise imperceptible destructive trend became directly evident and palpable

The assumption of the existence of a death instinct or a destruction instinct has rou ed opposition even in analytical circles I know that there is a great tendency to ascribe all that is dan erous and hostile in love rather to a fundamental bipolarity in its own nature The conceptions I have summarized here I first put forward only tentatively but in the course of time they have won such a hold over me that I can no longer think in any other way To my mind they are theoretically far more fruitful than any others it is possible to employ they provide us with that simplification without either ignoring or doing violence to the facts which is what we strive after in scientific work I know that we have always had before our eyes manifestations of the destruction instinct fused with erotism directed outwards and inwards in sadism and masochism but I can no longer understand how we could have overlooked the universality of non erotic aggression and destruction and could have omitted to give it its due significance in our interpretation of life (It is true that the destructive trend that is directed inwards when it is not erotically tinged usually eludes our perceptions) I can remember my own defensive attitude when the idea of an instinct of destruction first made its appearance in psycho analytical literature and how long it took until I became accessible to it That others should have shown the same resistance and still show it surpri es me less Tho e who love fairy tales do not like it when people speak of the innate tendencies in mankind towards aggression destruction and in addition cruelty For God has made them in his own image with his own perfections no one wants to be reminded how hard it is to reconcile the undeniable existence—in spite of all the protestations of Christian Science—of evil with His omnipotence and supreme goodness The devil is in fact the best way out in acquittal of God he can be used to play the same economic role of outlet as Jews in the world of Aryan ideals But even so one can just as well hold God responsible for the existence of the devil as for the evil he personifies In view of

Th[illegible] c[illegible] t[illegible] d[illegible]ct[illegible] betwee[illegible] th[illegible] t[illegible]eles[illegible] t[illegible] d[illegible] cy [illegible]f E[illegible] t[illegible] sp[illegible]ead[illegible] e[illegible] f[illegible] the[illegible] d[illegible]th[illegible] g[illegible] [illegible] rv[illegible] t[illegible] ature of th[illegible] [illegible]ts h[illegible] e bec[illegible]m[illegible] ry[illegible] t[illegible]ce [illegible]bl[illegible] t[illegible] w[illegible]ld[illegible] erv[illegible] s th[illegible] sta[illegible]t[illegible] g p[illegible] t[illegible] f[illegible] q[illegible] int[illegible] f[illegible] ther p[illegible]blems.

these difficulties it is expedient for every man to make humble obeisance on suitable occasions in honour of the high-minded nature of men; it will make him to become universally beloved and much shall be forgiven unto him on account of it.

The name *libido* can again be used to denote the manifestations of the power of Eros in contradistinction to the energy of the death instinct. We must confess that it is more difficult for us to detect the latter and, to a great extent, we can merely conjecture its existence as a background to Eros, also that it eludes us wherever it is not betrayed by a fusion with Eros. In sadism, where it bends the erotic aim to its own will and yet at the same time gratifies the sexual craving completely, we can obtain the clearest insight into its nature and its relation to Eros. But even where it shows itself without any sexual purpose, even in the blindest frenzy of destructiveness, one cannot ignore the fact that satisfaction of it is accompanied by an extraordinarily intense narcissistic enjoyment, due to the fulfilment it brings to the ego of its oldest omnipotence-wishes. The instinct of destruction, when tempered and harnessed (as it were, inhibited in its aim) and directed towards objects, is compelled to provide the ego with satisfaction of its needs and with power over nature. Since the assumption of its existence is based essentially on theoretical grounds, it must be confessed that it is not entirely proof against theoretical objections. But this is how things appear to us now in the present state of our knowledge; future research and reflection will undoubtedly bring further light which will decide the question.

In all that follows I take up the standpoint that the tendency to aggression is an innate, independent, instinctual disposition in man, and I come back now to the statement that it constitutes the most powerful obstacle to culture. At one point in the course of this discussion the idea took possession of us that culture was a peculiar process passing over human life and we are still under the influence of this idea. We may add to this that the process proves to be in the service of Eros, which aims at binding together single human individuals, then families, then tribes, races, nations, into one great unity, that of humanity. Why this has to be done we do not know; it is simply the work of Eros. These masses of men must be bound to one another libidinally; necessity alone, the advantages of common work, would not hold them together. The natural instinct of aggressiveness in man, the hostility of each one against all and of all against each one, opposes this programme of civilization. This instinct of aggression is the derivative and main representative of the death instinct we have found alongside of Eros, sharing his rule over the earth. And now, it seems to me, the meaning of the evolution of culture is no longer a riddle to us. It must present to us the struggle between Eros and death, between the instincts of life and the instincts of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of and so the evolution of civilization may be simply described as the struggle of the human species for existence. And it is this battle of the Titans that our nurses and governesses try to compose with their lullaby-song of Heaven!

VII

WHY do the animals kin to ourselves not manifest any such cultural struggle? Oh, we don't know. Very probably some of them—bees, ants, termites—had to strive for thousands of centuries before they found the way to those State institutions, that division of function, those restrictions upon individuals which we admire them for today. It is characteristic of our present state that we know by our own feelings that we should not think ourselves happy in any of these communities of the animal world, or in any of the roles they delegate to individuals. With other animal species it may be that a temporary deadlock has been reached between the influences of their

[1] In Goethe's Mephistopheles we have a quite convincing identification of the principle of evil with the instinct of destruction:

> *All entities that [illegible]*
> *Deserve their end—[illegible]*
>
> *So all that you name sin, destruction—*
> *[illegible]*
> *That is my element [illegible]*

As his adversary the devil himself cites not what is holy and good, but the power in nature working towards the creation and renewal of life—that is, Eros.

> *From air, from [illegible] germs [illegible]*
> *[illegible] forth [illegible] free*
> *[illegible] warm [illegible]*
> *Had I [illegible] creation*
> *[illegible] for me*

Our present point of view can be roughly expressed in the statement that libido participates in every instinctual manifestation, but that not everything in that manifestation is libido.

And we may probably add more precisely that its form was necessarily determined after some event which still remains to be discovered.

environment and the instincts contending with in them so that a cessation of development has taken place In primitive man a fresh access of libido may have kindled a new spurt of energy on the part of the instinct of destruction There are a great many questions in all this to which as yet we have no answer

Another question concerns us more closely now What means does civilization make use of to hold in check the aggressiveness that opposes it to make it harmless perhaps to get rid of it? Some of these measures we have already come to know though not yet the one that is apparently the most important We can study it in the evolution of the individual What happens in him to render his craving for aggression innocuous? Something very curious that we should never have guessed and that yet seems simple enough The aggressiveness is introjected *internalized* in fact it is sent back where it came from i e directed against the ego It is there taken over by a part of the ego that distinguishes itself from the rest as a super ego and now in the form of *conscience* exercises the same propensity to harsh aggressiveness against the ego that the ego would have liked to enjoy against others The tension between the strict super ego and the subordinate ego we call the *sense of guilt* it manifests itself as the need for punishment Civilization therefore obtains the mastery over the dangerous love of aggression in individuals by enfeebling and disarming it and setting up an institution within their minds to keep watch over it like a garrison in a conquered city

As to the origin of the sense of guilt analysts have different views from those of the psychologists nor is it easy for analysts to explain it either First of all when one asks how a sense of guilt arises in anyone one is told something one cannot dispute people feel guilty (pious people call it sinful) when they have done something they know to be *bad* But then one sees how little this answer tells one Perhaps after some hesitation one will add that a person who has not actually committed a bad act but has merely become aware of the intention to do so can also hold himself guilty and then one will ask why in this case the intention is counted as equivalent to the deed In both cases however one is presupposing that wickedness has already been recognized as reprehensible as something that ought not to be put into execution How is this judgment arrived at? One may reject the suggestion of an original—as one might say natural—capacity for discriminating between good and evil Evil is often not at all that which would injure or endanger the ego on the contrary it can also be something that it desires that would give it pleasure An extraneous influence is evidently at work it is this that decides what is to be called good and bad Since their own feelings would not have led men along the same path they must have had a motive for obeying this extraneous influence It is easy to discover this motive in man s helplessness and dependence upon others it can best be designated the *dread of losing love* If he loses the love of others on whom he is dependent he will forfeit also their protection against many danger and above all he runs the risk that this stronger person will show his superiority in the form of punishing him What is bad is therefore to begin with whatever causes one to be threatened with a loss of love because of the dread of this loss one must desist from it That is why it makes little difference whether one has already committed the bad deed or only intends to do so in either case the danger begins only when the authority has found it out and the latter would behave in the same way in both cases

We call this state of mind a *bad conscience* but actually it does not deserve this name for at this stage the sense of guilt is obviously only the dread of losing love *social* anxiety In a little child it can never be anything else but in many adults too it has only changed in so far as the larger human community takes the place of the father or of both parents Consequently such people habitually permit themselves to do any bad deed that procures them something they want if only they are sure that no authority will discover it or make them suffer for it their anxiety relates only to the possibility of detection Present day society has to take into account the prevalence of this state of mind

A great change takes place as soon as the authority has been internalized by the development of a super ego The manifestations of conscience are then raised to a new level to be accurate one should not call them conscience and sense of guilt before this At this point

t g a ph f I fl All th t has bee d b j g d t sc d g lt m r is mm k wl dg d p t cally d p ted

the dread d[illegible]covery cea es to opera e and also care for all any d[illegible]eren e between d[illegible]ng evil and wis[illegible] t[illegible] d[illegible] m e nothing is h d den from the super-ego not even thoughts. The seri [illegible] of th[illegible] tuat on has [illegible] ed [illegible] the f t[illegible] new auth rity the super-ego has [illegible] far a we know fo ill-trea [illegible]

[illegible] and [illegible] mitted to be re li ed, ma i[illegible] fests itself so that on the w[illegible] e thi[illegible] remain as they were t the beginning. The super-ego torments t[illegible] sinful ego w h the s m feelings of dre and w[illegible] es for opportun[illegible] es whereby the outer wo ld can be made to punish h[illegible]

At this second t[illegible] e f development, con science exhib[illegible] s a peculiarity which was absent [illegible] first and is [illegible] t very easy to ccount fo That is the more righteous a man i th stricter and more suspicious will his conscience be so th[illegible] [illegible] [illegible] pressel those people who have carried h[illegible] es fart[illegible]es wh re proach them[illegible] [illegible]es w h the deepest s fulness. This means that virtue forfe[illegible]s some of her promised reward th[illegible] [illegible] e and abstemi ous ego does [illegible]t enjoy the tru t and confidence of its men or a[illegible]d, a[illegible] t seem[illegible] tri es in vain t earn it. Now t t[illegible] om peopl will be ready to [illegible] that these difficulties are [illegible] [illegible] A reli[illegible] [illegible] nt and [illegible]lant co [illegible] is the very [illegible]gn of a [illegible]t[illegible]ous m[illegible] and [illegible] may proclaim themselves sinners they are n t so wrong in v ew f th tempta tions [illegible] instinctual gratifica ons to whi h they are peculiarl [illegible] as w[illegible] an w temptation d b[illegible] increase under c[illegible] tan [illegible], whereas they [illegible] de[illegible] a[illegible] v rat tempora [illegible] if they re som t mes gratified. Th[illegible] field c ethics is rich in p b em and another f t[illegible] f [illegible] w f[illegible] d b e is tha[illegible] mis[illegible] [illegible] external deprivat on greatly in [illegible] t[illegible] strength f c nscience [illegible] th super-ego A long as things go well with man h[illegible] o[illegible] [illegible] is lenient and l[illegible]s the ego do all kinds f [illegible] when som ca[illegible]am t befall [illegible] [illegible] on within discov rs his s[illegible] [illegible] th standa ds of his conscience [illegible] between es on him[illegible] lf and pun[illegible]hes [illegible] with penances. Whol peoples h[illegible]

acted in this way a d [illegible] do o But th[illegible] is ea[illegible]y explained from the original infantil stage of con c ence wh ch a we thus see is not abandoned after th[illegible] [illegible] project on [illegible] to the super-ego but pers ts alo[illegible]s de a d behind the latter Fate is felt to be a [illegible] t[illegible]e for the agency of the parents adver[illegible] means th t one [illegible]s no longer loved b[illegible] th[illegible]s h[illegible] e t power of all, a d threatened b th[illegible]s los of lo e one humbles [illegible]self aga[illegible]n before the representa[illegible] e of th parents in the super-ego wh ch in happier days one had tried to d[illegible] [illegible] d This becomes especially clear when dest[illegible] y [illegible] looked upon in the [illegible] religious [illegible] as th express on of God s w l a[illegible]d n th[illegible] else. The people of I[illegible] l believed themsel es to be God's fa[illegible] ourit e ch[illegible] l en and when t e great F ther hurled v[illegible] at on after vis tat on upon them t till never [illegible] them [illegible] this bel f o caused them to d[illegible] bt His power and H[illegible] s ju tice they pro ceeded [illegible] to bri[illegible] their proph ts into the wo ld to decla e their [illegible] inful ess to them a[illegible]d out f their sense of gu t they constructed th[illegible] [illegible]ringent comma dments of th[illegible]r priestl re ligion. It is cu[illegible]ous how d[illegible] [illegible] a sa[illegible] beha es If h[illegible] h[illegible]s had h[illegible]d f rt[illegible]ne he does no [illegible]

Hence w[illegible] kn w of two sources fo feel[illegible]s of guilt th t aris[illegible] g from the dread of [illegible] h[illegible] rit and the la er one from the dread of the super ego Th firs one compels us to ren unce i[illegible] stinctual gratifica on t[illegible] o her presses over and bove this towards punishment, ince the persistence f forb dden wi[illegible] es cann t be con cealed from the [illegible]-ego W ha e also heard how the sever[illegible] of the super-ego th rigour of con cience is to be explained. It s[illegible]mply carries on the [illegible] f xternal [illegible] [illegible]ty wh ch it has s[illegible] ceeded and to ome e ter re placed. W see now h w renunciat on o in stinctual gratification is rela ed t th sen e f guil Originall [illegible]t s true renunciation is th consequen[illegible] f dread of external authori y one gi es up plea[illegible] res so n t to los t l e Ha[illegible] [illegible] mad th[illegible]s renunciation on [illegible] is quits with a th rity [illegible] t [illegible]peak no feeling of guilt should remain. B[illegible] with the dread of th super ego th ca[illegible] is different Renunciat[illegible] f gra ficatio does n t suffice here fo the w[illegible]h persists and is not capab f being hidden from the super-ego [illegible] f th renuncia[illegible] m de feel[illegible]gs guil will be experienced a d this is a grea[illegible] disadvantag [illegible]onomicall of the [illegible]ction f the super-ego or as on m[illegible] y

This increased sens[illegible] [illegible] f moral [illegible] consequence of [illegible] has been illustrated by M[illegible] k Twa[illegible] [illegible] [illegible] [illegible] [illegible] ory [illegible] I ever S[illegible] [illegible] I am [illegible] the story himself [illegible] [illegible] [illegible] f his lec[illegible] [illegible] he had [illegible] [illegible] [illegible] [illegible] and asked [illegible] the [illegible] ory [illegible] the [illegible] This

of the formation of conscience Renunciation no longer has a completely absolving effect virtuous restraint is no longer rewarded by the assurance of love a threatened external unhappiness—loss of love and punishment meted out by external authority—has been exchanged for a lasting inner unhappiness the tension of a sense of guilt

These inter relations are so complicated and at the same time so important that in spite of the dangers of repetition I will consider them again from another angle The chronolo ical sequence would thus be as follows first instinct renunciation due to dread of an aggression by external authority—this is of course tantamount to the dread of loss of love for love is a protection against these punitive *aggressions Then follows the erect* [illegible] internal [illegible] due to [illegible] In the [illegible] it is the equivalence of wicked acts and wicked intentions hence comes the sense of guilt the need for punishment The aggressiveness of conscience carries on the aggressiveness of authority Thus far all seems to be clear but how can we find a place in this scheme for the effect produced by misfortune (i e renunciations externally imposed) for the effect it has of increasing the rigour of conscience? How account for the exceptional stringency of conscience in the best men those least given to rebel against it? We have already explained both these peculiarities of conscience but probably we still have an impression that these explanations do not go to the root of the matter and that they leave something still unexplained And here at last comes in an idea which is quite peculiar to psycho analysis and alien to ordinary ways of thinking Its nature enables us to understand why the whole matter necessarily seemed so confused and obscure to us It tells us this in the beginning conscience (more correctly the anxiety which later became conscience) was the cause of instinctual renunciation but later this relation is reversed Every renunciation then becomes a dynamic fount of conscience every fresh abandonment of gratification increases its severity and intolerance and if we could only bring it better into harmony with what we already know about the development of conscience we should be tempted to make the following paradoxical statement Conscience is the result of instinctual renunciation or Renunciation (externally imposed) gives rise to conscience which then demands further renunciations.

The contradiction between this proposition and our previous knowledge about the genesis of conscience is not in actual fact so very great and we can see a way in which it may be still further reduced In order to state the problem more easily let us select the example of the instinct of aggression and let us suppose that the renunciation in question is always a renunciation of aggression This is of course merely a provisional assumption The effect of instinctual renunciation on conscience then operates as *follows* every impulse of aggression which we omit to gratify is taken over by the super ego and goes to heighten its aggressiveness (against the ego) It does not fit in well with this that the original aggressiveness of conscience should represent a continuance of the rigour of external authority and so have nothing to do with renunciation But we can get rid of this discrepancy if we presume a different origin for the first quantum of aggressiveness with which the super ego was endowed

When authority prevented the child from enjoying the first but most important gratifications of all aggressive impulses of considerable intensity must have been evoked in it irrespective of the particular nature of the instinctual deprivations concerned *The child must* necessarily have had to give up the satisfaction of these revengeful aggressive wishes In this situation in which it is economically so hard pressed it has recourse to certain mechanisms well known to us by the process of identification it absorbs into itself the invulnerable authority which then becomes the super e o and comes into possession of all the aggressiveness which the child would gladly have exerci ed against it The child s ego has to content itself with the unhappy role of the authority—the father—who has been thus degraded It is as so often a reversal of the original situation If I were father and you my child I would treat *you* badly The relation between super ego and ego is a reproduction distorted by a wish of the real relations between the ego before it was subdivided and an external object That is also typical The essential difference however is that the original severity of the super ego does not—or not so much—represent the severity which has been experienced or anticipated from the object but expresses the child s own aggressiveness towards the latter If this is correct one could truly assert that conscience is formed in the beginning from the suppression of an aggressive impulse

and strengthened as time goes on by *each fresh* ren ns of the ki d.

Now which f these two theories is the true one The ea li r which seemed genet cally o ma...lable or the new one which rounds off our theories in such a welcom manner? Clear ly they are both j t fied and by the ev dence too f *direct observati n* they d not contra dict each other and eve co c d t one po nt f r the child's revengeful aggress enes will be in part provok d by the amount of puni h m... agres o that it ant c pates from the f her Experience has hown, however that the seve ty which a child s upe -ego develops in way orre po ds t the severity of the treatment t has itself experienced It seems to be independent of the latte a child which has been ery leniently treated can acquire a ery strict co science But t wo ld also be wrong to exagg rate this independence it is not difficult t as ure o eself that strict upbringin also has a stron influ nce n the f rmation of child s super-ego It c mes to this that the formati n f the super-e and the development of consc e e e determined in part by inn te const t tion l f ctors and in part by the infl enc of th actual enviro ment and that is in no w y urprising—on th c trary t is th in ari ble aetiological dition f ll such pro es es

It m y also b said that when a hild eacts to the first great instinct al depri ations with an ex es e gr s eness and a orrespo d in stri tness f ts super-ego it is ther by f llowing a phylogen t c p ototype unheedful f what reactio would in reality be ju tified f the f th f primiti tim wa ertainly t rrifying and on may safely ttribut th utm t degree f ggres en to him The diffe en s betw en the two theories f the genesis f o ce ar thus till f rther di minished if one pas es from ind 'u l to ph lo enet c development. But then on the otl er hand we find a new important dif rence between the two proces es We cannot d sregard the co clus on that man s sen e of gu lt has its orig n in the Oed pus complex and was ac qu red when the f ther was killed by the as oci at on of the broth rs At that time the agres-si n was not s ppressed but carried out a d it is this same act of agress on whose suppres-s on in the child we regard as the ource of feelin s of gu lt N w I should not be sur pri ed if a reader were to cry out a nly So it makes no d fference whether one does kill o e s father or does not one gets a feel ng of guilt in e ther ca e! *Here I should th nk* one may be allowed ome doubts E ther it is not true that guilt is evoked by upp essed aggres-eness or el e the whole story about the f th r murder s a rom nce, and primeval man d d not kill his fath r any more often than people do n wada s Bes des this f it is n t a rom nce but a plausible p ece of h tory it would only be an in t nce of what we all ex pect to happen, *namely that one feels guilty* because o e has really done someth n which cannot be justifi d And what we are all wa t ing f r i f r psycho-analys to gi e us an explanat on of this rea t n which at any rate is s meth ng that happens every d y

This is true and we must make good the omis on Th e is no great mystery about t e ther When one has feel s of gu lt after *one has committed some crime and because of* it thi feeling hould more prope ly be called *emo e* It r lates o ly t th one act and cl a ly t presupposes that *on c e ce* the ca pa ty for feel s f gu lt was l eady in ex tence before the deed Rem rse of this kind ca th *refo e ne er* help us t find out the ourc of ons ence and feelings of guilt in general. In these ev ryday instances th course of events s us lly as foll ws an *instinctual* eed cqui es th t ength to chieve fulfilment in sp te of con cien the trength of which al has ts limits whereupon the inev table reduct of th n ed fte satisfaction esto es th ea li bal e of f es Psycho-analysis is quite ju tified therefore in ex l ding the ca e f sens f guilt th u h remorse from this discus on however f equently t may oc cu and howev r great ts importance *m y* be pract lly

B t if man s sense of guilt g es b k to the m rder of the f ther that was undoubtedly an insta f *rem* e and y t r we to uppose

As has h l bee emphasized by M la Klein and the E gl h wr rs.

that there were no conscience and feelings of guilt before the act on that occasion? If so where did the remorse come from then? This instance must explain to us the riddle of the sense of guilt and so make an end of our difficulties And it will do so as I believe This remorse was the result of the very earliest primal ambivalence of feelings towards the father the sons hated him but they loved him too after their hate against him had been satisfied by their aggressive acts their love came to expression in their remorse about the deed set up the super ego by identification with the father gave it the father's power to punish as he would have done the aggression they had performed and created the restrictions which should prevent a repetition of the deed And since impulses to aggressions against the father were repeated in the next generations the feelings of guilt too persisted and were further reinforced every time an aggression was suppressed anew and made over to the super ego At this point it seems to me we can at last clearly perceive the part played by love in the origin of conscience and the fatal inevitableness of the sense of guilt It is not really a decisive matter whether one has killed one's father or abstained from the deed one must feel guilty in either case for guilt is the expression of the conflict of ambivalence the eternal struggle between Eros and the destructive or death instinct This conflict is engendered as soon as man is confronted with the task of living with his fellows as long as he knows no other form of life in common but that of the family it must express itself in the Oedipus complex cause the development of conscience and create the first feelings of guilt When mankind tries to institute wider forms of communal life the same conflict continues to arise —in forms derived from the past—and intensified so that a further reinforcement of the sense of guilt results Since culture obeys an inner erotic impulse which bids it bind mankind into a closely knit mass it can achieve this aim only by means of its vigilance in fomenting an ever increasing sense of guilt That which began in relation to the father ends in relation to the community If civilization is an inevitable course of development from the group of the family to the group of humanity as a whole then an intensification of the sense of guilt—resulting from the innate conflict of ambivalence from the eternal struggle between the love and the death trends—will be inextricably bound up with it until perhaps the sense of guilt may swell to a magnitude that individuals can hardly support One is reminded of the telling accusation made by the great poet against the *heavenly forces*

> *Ye set our feet on this life's road*
> *Ye watch our guilty erring courses*
> *Then leave us [illegible]*
> *For each thus its every debt enforces*

And one may heave a sigh at the thought that it is vouchsafed to a few with hardly an effort to salve from the whirlpool of their own emotions the deepest truths to which we others have to force our way ceaselessly groping amid torturing uncertainties

VIII

ON reaching the end of such a journey as this the author must beg his readers to pardon him for not having been a more skilful guide not sparing them bleak stretches of country at times and laborious detours at others There is no doubt that it could have been done better I will now try to make some amends

First of all I suspect the reader feels that the discussion about the sense of guilt oversteps its proper boundaries in this essay and takes up too much space so that the rest of the subject matter which is not always closely connected with it gets pushed to one side This may have spoilt the composition of the work but it faithfully corresponds to my intention to represent the sense of guilt as the most important problem in the evolution of culture and to convey that the price of progress in civilization is paid in forfeiting happiness through the heightening of the sense of guilt What sounds puzzling in this statement which is the final conclusion of our whole investigation is probably due to the quite peculiar relation—as yet completely unexplained—

Goethe *Wilhelm Meister* Th[illegible] of th[illegible] Harpe[illegible]

[illegible]

the sense of guilt has to our consciousness. In the common cases of remorse which we think normal it becomes clearly perceptible to consciousness; indeed, we often speak of *consciousness of guilt* instead of sense of guilt. In our study of the neuroses, to which we have owed invaluable clues towards an understanding of normal people, we find some very contradictory states of affairs in this respect. In one of these maladies, the obsessional neurosis,

the sense of guilt makes itself noisily heard alongside of the other types and forms of neuroses it remains completely unconscious, without its effect being any less great, however. Our patients do not believe us when we ascribe an unconscious sense of guilt to them; in order to become even moderately intelligible to them we have to explain that the sense of guilt expresses itself in an unconscious seeking for punishment. But its connection with the form of the neurosis is not to be over-estimated; even in the obsessional neurosis there are people who are not aware of their sense of guilt, or who perceive it only as a tormenting uneasiness or kind of anxiety, and then not until they are prevented from carrying out certain actions. We ought some day to be able to understand these things; as yet we cannot. Here perhaps is the place to remark that at bottom the sense of guilt is nothing but a topographical variety of anxiety, and that in its later phases it coincides completely with the dread of the super-ego. The relation of anxiety to consciousness is characterized by the same extraordinary variations. Somewhere or other there is always anxiety hidden behind every symptom; but at one moment, however, sweeping clamorously it drowns everything; at another it so completely conceals itself that we are forced to speak of unconscious anxiety—or if we want to have a clear conscience psychologically, of anxiety of possibilities, because anxiety is after all only a perception—of possibilities of anxiety. Consequently it is very likely that the sense of guilt produced by culture is not perceived as such, and remains to a great extent unconscious, or comes to expression as a sort of uneasiness or discontent for which other motivations are sought. The different religions at any rate, have never overlooked the part played by the sense of guilt in civilization. What is more, they come forward with a claim

which I have not considered elsewhere to save mankind from this sense of guilt, which they call sin. We indeed have drawn our conclusions from the way in which in Christianity this salvation is won—the sacrificial death of one who therewith takes the whole of the common guilt of all upon himself—about the occasion on which this primal sense of guilt was first acquired, that is the occasion which was also the beginning of culture.

It will not be very important, but it may be just as well to go more precisely into the meaning of certain words like *super-ego*, *conscience*, *sense of guilt*, *need for punishment*, *remorse*, which we have perhaps often used too loosely and in place of one another. They all relate to the same situation, but they denote different aspects of it. The *super-ego* is an agency or institution in the mind whose existence we have inferred. *Conscience* is a function we ascribe among others to the super-ego; it consists of watching over and judging the actions and intentions of the ego, exercising the functions of a censor. The *sense of guilt*, the severity of the super-ego, is therefore the same thing as the rigour of conscience; it is the perception the ego has that it is watched in this way, the ego's appreciation of the tension between its own strivings and the standards of the super-ego; and the anxiety that lies behind all these relations, the dread of that critical institution, the *need for punishment*, is an instinctual manifestation on the part of the ego which has become masochistic under the influence of the sadistic super-ego; it is part of the instinct of destruction at work within itself in the ego, employed to form an erotic attachment to the super-ego. We ought not to speak of conscience before a super-ego is demonstrable; as to consciousness of guilt we must admit that it comes into being before the super-ego, therefore before conscience. At that time it is the direct expression of the dread of external authority, the recognition of the tension between the ego and this latter; it is the direct derivative of the conflict between the need for parental love and the urgency towards instinctual gratification, and it is the thwarting of this urgency that produces the tendency to aggression. It is because these two different versions of the sense of guilt—one arising from dread of the external authority, the other from dread of the internal authority—are superimposed one on the other that our

Imago ... ; The Future of an Illusion.
Totem and Taboo (1913).

insight into the relations of conscience has been hampered in so many ways *Remorse* is a general term denoting the ego s reaction under a special form of the sense of guilt it includes the almost unaltered sensory material belonging to the anxiety that is at work behind the sense of guilt it is itself a punishment and may include the need for punishment it too therefore may occur before conscience has developed

Further it will do no harm for us to review once more the contradictions which have confused us at times during our enquiries The sense of guilt we said at one point was the consequence of uncommitted aggressions but another time and in particular in the case of its historical beginning the murder of the father it was the consequence of an aggression that was carried out We also found a way out of this difficulty The development of the inner authority the super ego was precisely what radically altered the whole situation Before this the sense of guilt coincided with remorse we observe in saying this that the term *remorse* is to be reserved for the reaction after an actual performance of an aggressive deed After this the omniscience of the super ego robbed the distinction between intended aggressions and aggressions committed of its significance a mere intention to commit an act of violence could then evoke a sense of guilt—as psycho analysis has found—as well as one which has actually been committed—as all the world knows The conflict of ambivalence between the two primal instincts leaves the same impress on the psychological situation irrespective of the change that has taken place in this A temptation arises to look here for an explanation of the mystery of the varying relation between the sense of guilt and consciousness The sense of guilt which is due to remorse for an evil deed must always have been conscious that due to a perception of an evil impulse could have remained unconscious But it cannot be as simple as that the obsessional neurosis contradicts it emphatically The second contradiction was that the aggressive energy with which one imagined the super ego to be endowed was according to one view merely a continuation of the punitive energy belonging to external authority preserved within the mind whereas according to another view it consisted on the contrary of aggressive energy originating in the self levelled against this inhibiting authority but not allowed to discharge itself in actions The first view seemed to accord better with the history of the sense of guilt the second with the theory of it More searching reflection has resolved this apparently irreconcilable contradiction almost too completely what remained as essential and common to both was that in both cases we were dealing with an aggression that had been turned inward Clinical observation moreover really permits us to distinguish two sources for the aggressiveness we ascribe to the super ego each of which in any given case may be operating predominantly but which usually are both at work together

This I think is the place to suggest that a proposal which I previously put forward as a provisional assumption should be taken in earnest In the latest analytical literature a predilection has been shown for the view that any kind of privation any thwarted instinctual gratification results in a heightening of the sense of guilt or may do so I believe one obtains a great simplification of theory if one regards this as valid *only* for the aggressive instincts and that little will be found to contradict this assumption How then is it to be explained dynamically and economically that a heightening of the sense of guilt should appear in place of an unfulfilled erotic desire? This can surely only happen in a roundabout way the thwarting of the erotic gratification provokes an access of aggressiveness against the person who interfered with the gratification and then this tendency to aggression in its turn has itself to be suppressed So then it is after all only the aggression which is changed into guilt by being suppressed and made over to the super ego I am convinced that very many processes will admit of much simpler and clearer explanation if we restrict the finding of psycho analysis in respect of the origin of the sense of guilt to the aggressive instincts Reference to the clinical material here gives us no unequivocal answer because according to our own hypothesis the two kinds of instincts hardly ever appear in a pure form unmixed with each other but the investigation of extreme cases would probably point in the direction I anticipate I am tempted to extract our first advantage from this narrower conception by applying it to the repression process The symptoms of neurosis as we have learned are essentially substitutive gratifications for unfulfilled sexual wishes In the course of our ana

I p t c l t lb tl by Frn t J es
c Is cs M l Kl l I d rsta d.
th se l R k d Al d

her work we have found to our surprise that perhaps every neurosis masks a certain amount of unconscious sense of guilt which in its turn reinforces the symptoms by exploiting them as punishment. One is now inclined to suggest the following statement as a possible formulation: when an instinctual trend undergoes repression its libidinal elements are transformed into symptoms and its aggressive components into a sense of guilt. Even if this statement is only accurate as an approximation it merits our interest.

Some readers of this essay too may be under the impression that the formula of the struggle between Eros and the death instinct has been reiterated too often. It is supposed to characterize the cultural process which evolves in humanity but it has been related also to the development of the individual and besides this is supposed to have revealed the secret of organic life in general. It becomes necessary for us to examine the relation of these three processes to one another. Now the repetition of the same formula is vindicated by the consideration that the cultural processes, both in humanity and in the development of an individual, are life processes consequently they must both partake of the most universal characteristic of life. On the other hand evidence of the presence of this universal characteristic does not help us to discriminate unless it is further narrowed down by special qualifications. We can therefore set our minds at rest only if we say that the cultural process is the particular modification undergone by the life process under the influence of the task set before it by Eros and stimulated by Ananke, external necessity, and this task is that of uniting single human beings into a larger unity with libidinal attachments between them. When, however, we compare the cultural process in humanity with the process of development or upbringing in an individual human being, we shall conclude without much hesitation that the two are very similar in nature, if not in fact the same process applied to a different kind of object. The civilizing process in the human species is not really more of an abstraction than the development of an individual, and therefore hard to apprehend in concrete terms nor should the discovery of analogies be pushed to extremes but in view of the similar character of the aims of the two processes—in one the incorporation of an individual as a member of a group and in the other the creation of a [illegible] group out of many individuals—the similarity of the means employed and of the results obtained in the two cases is no surprise. In view of its exceptional importance we must no longer postpone mention of one feature differentiating the two processes. The *development of the individual* is ordered according to the program laid down by the pleasure principle, namely the attainment of happiness, and to this main objective it holds firmly; *the incorporation of the individual* as a member of a community or his adaptation to it, seems like an almost unavoidable condition which has to be filled before he can attain this objective of happiness. If he could achieve it without fulfilling this condition, it would perhaps be better. To express it differently, we may say: Individual development seems to us a product of the interplay of two trends, the striving for happiness, generally called *egoistic*, and the impulse towards merging with others in the community which we call *altruistic*. Neither of these descriptions goes far beneath the surface. In individual development, as we have said, the main accent falls on the egoistic trend, the striving for happiness, while the other tendency, which may be called the *cultural* one, usually contents itself with instituting restrictions. But things are different in the development of culture: here far the most important aim is that of *creating a single unity* out of individual men and women, while the objective of happiness, though still present, is pushed into the background; it almost seems as if humanity could be most successfully united into one great whole if there were no need to trouble about the happiness of individuals. The process of development in individuals must therefore be admitted to have its special features which are not repeated in the cultural evolution of humanity; the two processes only necessarily coincide in so far as the first also includes the aim of incorporation into the community.

Just as a *planet circles* around its *central* body while at the same time rotating on its own axis, so the individual man takes his part in the course of humanity's development as he goes on his way through life. But to our dull eyes the play of forces in the heavens seems set fast in a never-changing scheme; though in organic life we can still see how the forces contend with one another and the results of the conflict change from day to day. So in every individual the two trends, one towards personal happiness and the other towards unity with th[illegible]

rest of humanity must contend with each other so must the two processes of individual and of cultural development oppose each other and dispute the ground against each other This struggle between individual and society however is not derived from the antagonism of the primal instincts Eros and death which are probably irreconcilable it is a dissension in the camp of the libido itself comparable to the contest between the ego and its objects for a share of the libido and it does eventually admit of a solution in the individual as we may hope it will also do in the future of civilization—however greatly it may oppress the lives of individuals at the present time

The analogy between the process of cultural evolution and the path of individual development may be carried further in an important respect It can be maintained that the community too develops a super ego under whose influence cultural evolution proceeds It would be an enticing task for an authority on human systems of culture to work out this analogy in specific cases I will confine myself to pointing out certain striking details The super ego of any given epoch of civilization originates in the same way as that of an individual it is based on the impression left behind them by great leading personalities men of outstanding force of mind or men in whom some one human tendency has developed in unusual strength and purity often for that reason very disproportionately In many instances the analogy goes still further in that during their lives—often enough even if not always—such persons are ridiculed by others ill used or even cruelly done to death just as happened with the primal father who also rose again to become a deity long after his death by violence The most striking example of this double fate is the figure of Jesus Christ if indeed it does not itself belong to the realm of mythology which called it into being out of a dim memory of that primordial event Another point of agreement is that the cultural super ego just like that of an individual sets up high ideals and standards and that failure to fulfil them is punished by both with *anxiety of conscience* In this particular indeed we come across the remarkable circumstance that the mental processes concerned here are actually more familiar to us and more accessible to consciousness when they proceed from the group than they can be in the individual In the latter when tension arises the aggressions of the super-ego voicing its noisy reproaches are all that is perceived while its injunctions themselves often remain unconscious in the background If we bring them to the knowledge of consciousness we find that they coincide with the demands of the prevailing cultural super ego At this point the two processes that of the evolution of the group and the development of the individual are always firmly mortised together so to speak Consequently many of the effects and properties of the super ego can be more easily detected through its operations in the group than in the individual

The cultural super ego has elaborated its ideals and erected its standard Those of its demands which deal with the relations of human beings to one another are comprised under the name of *ethics* The greatest value has at all times been set upon systems of ethics as if men had expected them in particular to achieve something especially important And ethics does in fact deal predominantly with the point which is easily seen to be the sorest of all in any scheme of civilization Ethics must be regarded therefore as a therapeutic effort as an endeavour to achieve something through the standards imposed by the super ego which had not been attained by the work of civilization in other ways We already know—it is what we have been discussing—that the question is how to dislodge the greatest obstacle to civilization the constitutional tendency in men to aggressions against one another and for that very reason the commandment to love one's neighbour as oneself—probably the most recent of the cultural super ego's demands—is especially interesting to us In our investigation and our therapy of the neuroses we cannot avoid finding fault with the super ego of the individual on two counts in commanding and prohibiting with such severity it troubles too little about the happiness of the ego and it fails to take into account sufficiently the difficulties in the way of obeying it—the strength of instinctual cravings in the id and the hardships of external environment Consequently in our therapy we often find ourselves obliged to do battle with the super ego and work to moderate its demands Exactly the same objections can be made against the ethical standards of the cultural super ego It too does not trouble enough about the mental constitution of human beings it enjoins a command and never asks whether or not it is possible for them to obey it It presumes on the contrary that a man's ego is psychologically capable of anything that is required of it—that his ego has

m ed power over his d. This is an erro ren n so-called n rmal peop t powe of erning as can be i creased beyond certain lim s. It ex ks more of them, one makes rere e r neuroses m and makes them unhappy. The c d to l e our neighbour as ourselves is t n arest defence against human aggressiveness; m is superego we exam of the negative of cultural n te ind irrevertent. The command is impossible to fulfil; such an e inflation can only lower ue e remedy the evil. Ci ation pays no m ely preaches that th harder it to better the more blame Th the There remains the remember fact we th present sent te of civilization only prov ng a dissatisfaction here. ll t what e t in What is very elim m civilization great must h t deep an can cause s much misery aggression el es as r ha has no at off r here bend the aggressive of m of t kind ones f be t than others The are of the ethics a few promises bring in at the po promises of a better future life. I should imagine that as long as virtue is not rewarded on earth, ethics will preach in vain. I think it quite certain that a real change in the relations of human beings to property would be of more help in this direction than any ethical commandments; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

It seems to me that the point of view which seeks to trace in the phenomena of cultural evolution as manifestations of a super-ego promises to yield still further discoveries. I am coming quickly to an end. There is one question, however, which I can hardly evade. If the evolution of civilization has such a far reaching similarity with the development of an individual, and if the same methods are employed in both, would not the diagnosis be justified that many systems of civilization—or epochs of it—possibly even the whole of humanity—have become neurotic under the pressure of the civilizing trends? To analytic dissection of these neuroses, therapeutic recommendations might follow which could claim great practical interest. I would not say that such an attempt to apply psychoanalysis to civilized society would be fanciful or doomed to fruitlessness. But it behooves us to be very careful not to forget that after all we are dealing only with analogies, and that it is dangerous, not only with men but also with concepts, to drag them out of the region where they originated and have matured. The diagnosis of collective neuroses, moreover, will be confronted by a special difficulty. In the neurosis of an individual we can use as a starting-point the contrast presented to us between the patient and his environment which we assume to be normal. No such background as this would be available for any society; it would have to be supplied in some other way. And with regard to any therapeutic application of our knowledge, what would be the use of the most acute analysis of social neuroses, since no one possesses power to compel the community to adopt the therapy. In spite of all these difficulties, we may expect that one day someone will venture upon this research into the pathology of civilized communities.

For various reasons, it is very far from my intention to express any opinion concerning the value of human civilization. I have endeavoured to guard myself against the enthusiastic partiality which believes our civilization to be the most precious thing that we possess or could acquire, and thinks it must inevitably lead us to undreamed-of heights of perfection. I can at any rate listen without taking umbrage to those critics who aver that when one surveys the aims of civilization and the means it employs, one is bound to conclude that all the effort is not worth while and that the outcome can only be a state of things which the individual will be unable to bear. My impartiality is all the easier to me since I know very little about these things and am sure of only one thing, that the judgements of value made by mankind are immediately determined by their desires for happiness; in other words, that those judgements are attempts to prop up their illusions with arguments. I could understand it very well if anyone were to point to the inevitable nature of the process of cultural development and say, for instance, that the tendency to impose restrictions upon sexual life, or to carry humanitarian ideals into effect at the cost of natural selection, are developmental trends which it is impossible to avert or divert and to which it is best for us to submit as though they were natural necessities. I know, too, the objection that can be raised against this, that tendencies such as these which are believed to have insuperable

rest of humanity must contend with each other so must the two processes of individual and of cultural development oppose each other and dispute the ground against each other This struggle between individual and society however is not derived from the antagonism of the primal instincts Eros and death which are probably irreconcilable it is a dissension in the camp of the libido itself comparable to the contest between the ego and its objects for a share of the libido and it does eventually admit of a solution in the individual as we may hope it will also do in the future of civilization—however greatly it may oppress the lives of individuals at the present time

The analogy between the process of cultural evolution and the path of individual development may be carried further in an important respect It can be maintained that the community too develops a super ego under whose influence cultural evolution proceeds It would be an enticing task for an authority on human systems of culture to work out this analogy in specific cases I will confine myself to pointing out certain striking details The super ego of any given epoch of civilization originates in the same way as that of an individual it is based on the impression left behind them by great leading personalities men of outstanding force of mind or men in whom some one human tendency has developed in unusual strength and purity often for that reason very disproportionately In many instances the analogy goes still further in that during their lives—often enough even if not always—such persons are ridiculed by others ill used or even cruelly done to death just as happened with the primal father who also rose again to become a deity long after his death by violence The most striking example of this double fate is the figure of Jesus Christ if indeed it does not itself belong to the realm of mythology which called it into being out of a dim memory of that primordial event Another point of agreement is that the cultural super ego just like that of an individual sets up high ideals and standards and that failure to fulfil them is punished by both with *anxiety of conscience* In this particular indeed we come across the remarkable circumstance that the mental processes concerned here are actually more familiar to us and more accessible to consciousness when they proceed from the group than they can be in the individual In the latter when tension arises the aggressions of the super ego voicing its noisy reproaches are all that is perceived while its injunctions themselves often remain unconscious in the background If we bring them to the knowledge of consciousness we find that they coincide with the demands of the prevailing cultural super ego At this point the two processes that of the evolution of the group and the development of the individual are always firmly mortised together so to speak Consequently many of the effects and properties of the super ego can be more easily detected through its operations in the group than in the individual

The cultural super ego has elaborated its ideals and erected its standards Those of its demands which deal with the

pon systems of ethics as if men had expected them in particular to achieve something especially important And ethics does in fact deal predominantly with the point which is easily seen to be the sorest of all in any scheme of civilization Ethics must be regarded therefore as a therapeutic effort as an endeavour to achieve something through the standards imposed by the super ego which had not been attained by the work of civilization in other ways We already know—it is what we have been discussing—that the question is how to dislodge the greatest obstacle to civilization the constitutional tendency in men to aggressions against one another and for that very reason the commandment to love one's neighbour as oneself—probably the most recent of the cultural super ego's demands—is especially interesting to us In our investigation and our therapy of the neuroses we cannot avoid finding fault with the super ego of the individual on two counts in commanding and prohibiting with such severity it troubles too little about the happiness of the ego and it fails to take into account sufficiently the difficulties in the way of obeying it—the strength of instinctual cravings in the id and the hardships of external environment Consequently in our therapy we often find ourselves obliged to do battle with the super-ego and work to moderate its demands Exactly the same objections can be made against the ethical standards of the cultural super ego It too does not trouble enough about the mental constitution of human beings it enjoins a command and never asks whether or not it is possible for them to obey it It presumes on the contrary that a man's ego is psychologically capable of anything that is required of it—that his ego has

... ed power over his id. This is an error ... even in so-called normal people the power of controlling the id cannot be increased beyond certain limits. If one asks more of them, one produces revolt or neurosis in individuals or makes them unhappy. The command to love our neighbours as ourselves is the strongest defence against human aggressiveness and ... of the ... super-ego. The command is impossible to fulfil; such an ... can only lower its ... not ... remedy the evil. Civilization pays no ... all ... merely ... the harder ... the more laudable the obedience ... LECTURE 29

RE ISIO OF HE THEORY OF DREAMS

LADIES A D GE TLEMEN Aft silence f m re than fifteen years, I ha brought y u tog th gain n order to discuss with you the ew dev lopment t may be impro ement which ha e taken place in ps cho-analyt c th ry during the interval From m re than e point f view it is right and proper that we

A General Introduc ion Psycho-Analy p 449 bo

should turn our attention in the first place to the theory of dreams This theory occupies a peculiar position in the history of psycho analysis it marks a turning point With the theory of dreams analysis passed from being a psycho therapeutic method to being a psychology of the depths of human nature Ever since then the theory of dreams has remained the most characteristic and the most peculiar feature of the young science something which has no parallel in the rest of scientific kno[illegible] new [illegible] the [illegible] strang[illegible] ideas which are necessarily involved in it has made it into a shibboleth the use of which distinguishes those who might become believers in psycho analysis from those who are incapable of comprehending it Speaking for myself I always found it a thin I could hold on to during those difficult times when the unsolved problems of the neuroses used to confuse my inexperienced judgment Whenever I began to have doubts about the correctness of my tentative conclusions the moment I managed to translate a senseless and complicated dream into a clear and intelligible mental process in the dreamer I felt with renewed confidence that I was on the right track

It is therefore of especial interest for us to follow in regard to this particular matter of the theory of dreams what changes psycho analysis has undergone during the interval I have mentioned and what progress it has made in gaining appreciation and understanding from contemporary thought I may as well tell you straight away that you will be disappointed in both directions

Let us look through the volumes of the *Internationale Zeitschrift fur (ar tliche) Psychoanalyse* in which the most important work on our subject has appeared since 1913 In the earlier volumes you will find one recurring heading On the Interpretation of Dreams under which will be a quantity of contributions on various points of dream theory But the further you go the rarer such contributions become this standing heading eventually disappears entirely The analysts behave as though they had nothing more to say about the dream as though the whole subject of dream theory were finished and done with If on the other hand you ask how much of the theory of dreams is accepted by outsiders the numerous psychiatrists and psycho therapeutists who warm their pot of soup at our fire—without indeed being very grateful for our hospitality—the so called educated people who are in the habit of appropriating the more startling of the conclusions of science the literati and the general public then the answer is not very satisfactory A few formulae are generally known and among them several which we have never put forward such as the statement that all dreams are of a sexual nature but even such important things as the fundamental distinction between the manifest dream content and the latent dream thoughts the view that anxiety dreams do not contradict the wish fulfilling function of the dream the impossibility of interpretin a dream unless one knows the relevant associations of the dreamer and above all the recognition of the fact that the most important part of the dream is the dream work seem every one of them to be as far removed from the consciousness of the generality of mankind as they were thirty years a o I myself have every reason to say this because during that period I have received an enormous number of letters in which the writers inscribe their dreams for interpretation or ask for information about the nature of dreams They declare that they have read the *Interpretation of Dreams* and yet in every sentence they betray their lack of understanding of our dream theory That will not prevent our once more giving an account of what we know about dreams You will remember that last time we devoted a whole group of lectures to showing how we have come to understand this hitherto unexplained psychic phenomenon

Supposin some one says a patient under analysis tells us one of his dreams then we assume that he has made one of those communications to us to which he committed himself when he entered on his analytical treatment It is of course a communication which is insufficiently communicative because a dream is in itself not a social utterance it is not a means for making one elf understood We hav not indeed the least idea what the dreamer wishes to say and he him elf knows no better than our elves At the out et we have to make a quick decision On the one hand the dream may be as the non analytical physicians assure us an indication that the dreamer has slept badly that not all the parts of his brain achieved a uniform tate of re t that certain regions of it endeavoured to go on working under the influence of unknown stimuli and could only do o in a very incomplete way If that is the case then we are quite right not to bother ourselves any longer over this psycho

ically worthless product of nocturnal disturbance. *For how could we expect from the* investigation of such things to arrive at anything useful for our purposes On the other hand, however—but it is clear that from the outset we have decided otherwise We have—perhaps quite arbitrarily—made the assumption, put forward the postulate that even this unintelligible dream must be a perfectly valid sensible and valuable psychic act of which we can make use in the analysis just like any other *communication.* Only the result of our experiment can show us whether we are right If we succeed in turning the dream into a valuable utterance of this kind then we obviously have a chance of learning something new and of obtaining information of such a sort as otherwise would remain inaccessible to us

Now however the difficulties of our task and the puzzling nature of our theme become apparent. How are we going to set about turning a dream into a normal communication and how are we going to explain that a part of the utterance of our patient has taken on a form which is as unintelligible for him as for us?

You will observe ladies and gentlemen that this time I am not expounding the subject on genetic lines, but I am speaking dogmatically The first thing we have to do is to lay the foundations of our new attitude towards the problem of the dream by introducing two new concepts and two new names We call what one usually refers to as the dream the dream text or the *manifest* dream and what we are looking for what we suspect to lie behind the dream the *latent* dream thoughts Now we can express our two problems in the following way we have got to turn the manifest dream into the latent dream and we have to show how the latter became the former in the mental life of the dreamer The first bit is a practical problem it comes under the heading of *dream interpretation* and requires a technique; the second is a theoretical problem its solution has been the explanation of the hypothetical *dream work* and can only be theory Both the technique of dream interpretation and the theory of the dream work have to be built up from the beginning

Which bit shall we begin with? I think we ought to start with the technique of dream interpretation It has a clearer outline and will make a more vivid impression on you

The patient then has described a dream which we have to interpret We have listened quietly without making use of our powers of reflection What do we do next? We determine to bother our heads as little as possible over what we have heard—over the *manifest* dream that is to say Naturally this manifest dream displays all sorts of characteristics to which we are not completely indifferent It may be coherent smoothly composed like a literary work or unintelligibly confused almost like a delirium it may have absurd elements or jokes and apparently brilliant inferences it may seem clear and well defined to the dreamer or it may be dim and indefinite the pictures in it may have the full sensuous force of a perception or they may be as shadowy and vague as a mist The greatest variety of characteristics [illegible] various

[illegible]

by a very strong pleasurable or painful effect You must not think that we regard this endless variety as a matter of no importance we

[illegible]

[interpre]tation of the dream This means that we ask the dreamer as well to free himself from the impression of the manifest dream to switch his attention from the dream as a whole to individual parts of its content and to tell us one after another the things that occur to him in connection with these parts, what associations come into his mind when he turns his mental eye to each of them separately

That is a curious technique is it not? It is not the usual way to treat a communication or an utterance You guess of course that behind this procedure there lie concealed assumptions

[illegible]

follow the chronological order in which the dream has been presented to us in description That is what one might call the strictest the classical method. Or we can ask the dreamer to look for the *residues of the previous day* in his dream because experience has taught us that in almost every dream is incorporated a memory trace of an allusion to an event (or it may be several events) of the previous day and if we follow up these links we often discover all of a sudden the bridge from the apparently remote dream world to the real life of the patient. Or we tell him to begin with those elements in the dream content which have

struck him on account of their clarity and sensuous force We happen to know that it is particularly easy for him to obtain associations to such elements It makes no difference by which of these ways we choose to reach the associations we are looking for

And now let us consider these associations They consist of the most varied material mem ories of the day before the dream day and memories of times long since passed delibera tions arguments for and against admissions and questionings A great many of them are poured out by the patient with ease while he hesitates when he reaches others Most of them show a clear connection with one of the ele ments of the dream and no wonder because they have actually sprung from these elements but it may also happen that the patient intro- duces them with the words That doesn t seem to have anything to do with the dream at all I say it because it comes into my head

When one listens to this flood of ideas one soon notices that they have more in common with the content of the dream than the mere fact that it provided them with their origin They throw an astonishingly clear light on all the parts of the dream they fill in the gaps between them and they make their odd juxta position intelligible Finally we must get clear the relation between them and the content of the dream The dream seems to be an abridged extract from the associations which has been put together in accordance with rules which we have not yet considered its elements are like the representatives of a multitude which have been chosen by vote There is no doubt that our technique has enabled us to discover what the dream has replaced and wherein lies its psychological value and what we have dis covered displays no longer the bewildering pe culiarities of the dream its strangeness and its confused nature

But let us have no misunderstanding The associations to the dream are not the latent dream thoughts These are contained but not completely contained in the associations On the one hand the associations produce a great deal more than we require for the formulation of the latent dream thoughts namely all the elaborations the transitions and the connect ing links which the intellect of the patient must produce on the road which leads to the dre m h

now play a part ourselves we follow up the indications we draw inevitable conclusions and bring out into the open what the patient in his associations has only touched upon That sounds as if we allow our cleverness and ou

ima

dre

it t

wha business to find there and indeed it is no easy matter to show the pro priety of our behaviour in an abstract exposi tion But if you try a dream analysis your selves or make yourselves familiar with a well described example from our lite

g u predominantly dependent on the associations of the dreamer nevertheless we treat certain elements of the content quite in dependently—mainly because we have to be cause as a rule associations refuse to come We noticed at an early stage that this happens always in connection with the same material these elements are not very numerous and long experience has taught us that they are to be taken as *symbols* for something else and to be interpreted as such In comparison with the other elements of the dream one can give them a permanent meanin which need not however be ambiguous and the limits of which are de termined by special laws which are of an un usual kind Since we understand how to trans late these symbols while the dreamer does not although he himself has made use of them it may very well be that the sense of the dream is immediately clear to us even before we have begun the work of dream interpretation as soon as we have heard the text of the dream while the dreamer himself is still puzzled by it But in the earlier lectures I have already said so much about symbolism about our knowledge of it and about the special problems to which it gives rise that I need not go over the same ground again today

That then is our method of dream interpre tation The next and very proper question is Can we by these means interpret every dream? And the answer is No not every one but so many that we can afford to be absolutely cer tain about the utility and correctness of our procedure But why not all? The recent answer to this question will teach us something im portant which has a bearing on the psychologi cal conditions of dream formation It is be cause the work of interpretation is carried on

n t.. f.ce of resist..nce wh ch may vary from
a imperceptibl amount to an amount so gre t
t..t we ca...ot overcome t—at any rate with
t.. means which are at present at our d sposal

h ma festation

already provi es us ... ...e ... ...
o..r places the pati nt pau es and hes t tes
be ore he utters an a sociat on and then one
... has to li en to long chain of ideas
be re e gets anythin wh ch is of any use
for t..e understanding of th dream We are
right in ...posing t..at th l ge d th more
... the chain f associa ons the stronger
is th resi..tance. And in the f rgetting of
dreams too we sense th same infl en e Often
... it happens that howev much h may
try the patient cann t remembe on f h s
dream. B t when by a p ce f alyt cal
work, w ha e rem ed a difficulty wh ch has
been disturbing th patient in his relat on to
th anal..s t.. f rgotten dream will ome into
his mind quite suddenly Two m r observa
tions may be men oned here It ry often
happens that a p ece f the dre..m is missing
which is even..ually added as an afterthou..ht.
This is t be regarded an ttempt to forget
t..t particu..r pi ce Experience shows that it
is this very p..ece of th dream which is the
most valuab we uppose that a stronger re-
tan stood in the way f its communica
tion than was th ca with the other parts.
And, furtherm re w often fi..d th..t a patient
may try to combat th f rgetti... f his dreams
by writing t..em down immediately fter he
wakes up We may as well tel him that t is
useless t d because the resistan from
...ch he may ha preserved th text f the
dream will then tran..fer ..self t th associa
tions and render th ma..ifest dream ina cessib e
for in erpretation This being the case we
need ot be surprised if a further increase f
th resist..nce s..ppresses the a...ociations alto-
ge..er a..d thus frustrates th interpreta..on
of th dream en..rely

From all this w draw t..e conc..sion t..t the
resistance which we om across during the
process of dream ...erpretation must play
some par in t.. formation f t.. dream as
w ll. One can ..ually distin....h between
d eams which have been formed under low
pressure f resi.....ce and those in which t..
res tance h..s been high. B.. th..s pressure also
c..anges wi...n the ..am.. dream from one place
to a other it is respons ble for the gaps the
ob curit es and the confusion which may up et
the coherence of the mo t beautiful dreams

But what is the res tance doing here and
wh t is it resisting? Now for us a res stance is
the sure s gn of a conflict There mu t be a
force present wh ch is tryi g to express ome
thing and another which is stri ing to prevent
its express on What comes into bein as the
man fest dream may th refore be regarded as
comprisin all the solutions to which the battle
between these two opposing forces can be re
duced At one point one of the forces may ha e
bee able to get throu..h what it wanted to say
at a other the counteracting fo ce ma ha e
succeeded in aboli hin the intended com
municat on ent rel or may ha e substit ted
for t om thin which betrays no s n of it.
Th m st usual ca es, and those which are the
mo t characteristic of the process of dream
formati re tho e in whi h the conflict re
sults in a compromise o that the commun cat
in force can ind ed say what t wants to say

pretat on is necessary to bridge the gulf
between the tw this s the result of the c un
teracting inhib tin and restrainin.. force
wh e existence we ha e inferred from percei
ing the resi..tance in dream interpretat on. So
long as we regarded the d m as n is lated
phenomenon independ nt of other ps chologi
cal f rmations which are all ed to it we called
this fo ce th *d e m-censor*

You ha e l g been familiar with the f ct
that this cen..orsh p is not a mechani..m which is
peculiar to dreams You remembe that the
conflict of two psychic factors which we—
roughly—call the *repre ed uncon cious* and
the *conscious* domin tes our li e and that the
esi..tance gain t the interpretation f dre ms
th hall ma k of the dream-cen rship is n n
oth r than the repress on esistance wh ch
keeps these tw f ctors part You also kn w
that, under ertain condit on other psycholog
cal form..tions emerg f m th conflict between
these sam f ctors formations whi h a e the
result f mp mises just as dreams are and
you will n t requir m t repeat all that is
in lved in my introduction t th theory f
the neuroses in order t put bef re you what
we know abo t th conditions under whi h such
compromise formations m bout. You will
have realized that th dream is a pathological

product the first member of the series which includes the hysterical symptom the obsession and the delusion among its members it is differentiated from the others by its transitoriness and by the fact that it occurs under conditions which are part of normal life For we must never forget that the dream life is as Aristotle has already told us the way our mind works during sleep The state of sleep represents a turning away from the real external world and thus provides a necessary condition for the development of a psychosis The most penetrating study of serious cases of psychosis will reveal no characteristic which is more typical of these patholo ical conditions In psychoses however the turning away from reality is brou ht about in two ways either because the repressed unconscious is too strong o that it overwhelms the conscious which tries to cling on to reality or because reality has become so unbearably painful that the threatened ego in a de pairing gesture of opposition throws itself into the arms of the unconscious impulses The harmless dream psychosis is the result of a consciously willed and only temporary withdrawal from the external world it ceases to operate when relations with the external world are resumed While the sleeper is i olated there is an alteration in the di tribution of his psychic energy part of the repressive expenditure which is otherwise u ed to keep down the unconscious can be aved for if the unconscious makes use of its relative freedom and enters on some activity it finds the avenue to motor expression stopped up and only the innocent outlet of hallucinatory satisfaction open to it It can now therefore form a dream but the fact of dream censorship shows that enou h repressive resistance remains operative even during sleep

Here we have an opportunity of answering the question whether the dream has also a function to perform whether any u eful ta k is entrusted to it The condition of repo e without timuli which the state of sleep attempts to bring about is threatened from three sides in a chance fashion by external stimuli during sleep by interests of the day before which have not yet abated and in an unavoidable m nner by the unsati fied repre ed impulses which are ready to seize on any opportunity for expression On account of the ni htly reduction of the repres ive forces the risk is run that the repose of sleep will be broken every time the outer and inner disturbances manage to link up with one of the unconscious sources of energy The dre m process allows the re ult of such a combination to discharge itself through the channel of a harmless hallucinatory experience and thus insures the continuity of sleep There is no contradiction of this function in the fact that the dream sometimes wakes the sleeper in a state of anxiety it is rather a sign that the watcher re ards the situation as being too dangerous and no lon er thinks he can cope with it Quite often indeed while we are still asleep we are aware of the comforting thou ht which is there to prevent our waking up After all it is only a dream

That is all ladies and gen lemen that I wanted to say about dream interp etation the business of which is to tra [illegible] h manifest d [illegible] When i [illegible] dream f [illegible] p int of view of practical analysis fades The analyst links up the communication which he has received in the form of a dream with the patient s other communications and proceed with the analysis We however wish to linger a little longer over the dream we ar tempted to study the proces by means of which the latent dream thoughts are transformed into the manife t dream We call thi the *dream work* You will remember that in the previous lectures I described it in such detail that for today s review of the subject I c n confine my elf to the briefest summary

The process of dream work is somethin quite new and strange the like of which has never before been known It ha given us our first glimpse into those proce ses which o on in our unconscious mental system and shows us that they are quite different from what we know about our conscious thou ht and that to this latter they mu t necessarily appear faulty and preposterous The importance of this discovery is increa ed when we realize that the same mechani ms—we hardly dare call them thought processes —are at work *in the formation of neurotic symptoms* as have turned the latent dream thoughts into the manifest dream

In what follows I cannot avoid making my exposition a chematic one Suppo ing we have before us in a given instance all the latent thoughts more or less affectively toned which have taken the place of the manife t dream after a complete interpretation We shall then notice a distinction among them and th s distinction will take us a long way Almo t all these dream thoughts will be recognized or acknowledged by the dreamer he will admit that he thought thus at one time or another or that

may very well have done so. But he may meet the representation of one impulse that seems to him strange, perhaps even repellent; it may be that he will passionately repudiate it. It then becomes clear to us that the other thoughts are bits of his conscious, or more correctly of his preconscious thought; they might very well have been thought during waking life, and have probably formed themselves during the day. This one rejected thought, or better, this one impulse, is a child of the night; it belongs to the unconscious of the dreamer and is therefore disowned and repudiated by him. It had to wait till the nightly relaxation of repression in order to achieve any sort of expression. In any case this expression that it obtains is enfeebled, distorted and disguised; without the work of interpretation we should never have discovered it. It is thanks to its connection with the other unobjectionable dream-thoughts that this unconscious impulse has had the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise; on the other hand, the preconscious dream-thoughts owe to this same connection their power of occupying the mental life even during sleep. We can, indeed, be in no doubt about this: the unconscious impulse is the real creator of the dream; it provides the psychic energy required for its formation. Just like any other instinctual impulse it can do nothing other than seek its own satisfaction, and our experience in dream-interpretation shows us moreover that this is the meaning of all dreaming. In every dream an instinctual wish is displayed as fulfilled. The nightly cutting-off of mental life from reality and the regression to primitive mechanisms which it makes possible enable the desired instinctual satisfaction to be experienced in a hallucinatory fashion as actually happening. On account of the same regression, ideas are turned into visual pictures in the dream; the latent dream-thoughts are, that is to say, dramatized and illustrated.

From this piece of dream-work we obtain information about some of the most striking and peculiar characteristics of the dream. Let me repeat the stages of dream-formation. The introduction: the wish to sleep, the voluntary withdrawal from the outside world. Two things follow from this: firstly, the possibility for older and more primitive modes of activity to manifest themselves, i.e. regression; and secondly, the decrease of the repression-resistance which weighs on the unconscious. As a result of this latter factor, an opportunity for dream-formation presents itself, which is seized upon by the factors which are the occasion of the dream, that is to say, the internal and external stimuli which are in activity. The dream which thus eventuates is already a compromise-formation; it has a double function: it is on the one hand in conformity with the ego (*ego-syntonic*), since it subserves the wish to keep by draining off the stimuli which would otherwise disturb it, while on the other hand it [illegible] The whole process of dream formation, which is permitted by the sleeping ego, is however under the control of the censorship, which is exercised by what is left of the forces of repression. I cannot explain the process more simply, because it is not in itself simpler than that. But now I can proceed with the description of the dream-work.

Let us go back once more to the latent dream-thoughts. Their dominating element is the repressed impulse which has obtained some kind of expression, toned down and disguised though it may be, by associating itself with stimuli which happen to be there and by tacking itself on to the residue of the day before. Just like any other impulse this one presses forward towards satisfaction in action, but the path to motor discharge is closed to it on account of the physiological characteristics of the state of sleep, and so it is forced to travel in the retrograde direction to perception and content itself with an hallucinatory satisfaction. The latent dream-thoughts are therefore turned into a collection of sensory images and visual scenes. As they are travelling in this direction something happens to them which seems to us new and bewildering. All the verbal apparatus by means of which the more subtle thought-relations are expressed, the conjunctions and prepositions, the variations of declension and conjugation, are lacking, because the means of portraying them are absent: just as in primitive, grammarless speech, only the raw material of thought can be expressed, and the abstract is merged again in the concrete from which it sprang. What is left over may very well seem to lack coherence. It is as much the result of the archaic regression in the mental apparatus as of the demands of the censorship that so much use is made of the representation of certain objects and processes by means of symbols, which have become strange to conscious thought. But of more far-reaching import are

the other alterations to which the elements comprising the dream thoughts are subjected Such of them as have any point of contact are *condensed* into new unities When the thoughts are translated into pictures those forms are indubitably preferred which allow of this kind of telescoping or condensation it is as though a force were at work which subjected the material to a process of pressure or squeezing together As a result of condensation one element in a manifest dream may correspond to a number of elements of the dream thoughts but conversely one of the elements from among the dream thou hts may be represented by a number of pictures in the dream

Even more remarkable is the other process of *displacement* or transference of accent which in conscious thinking figures only as an error in thought or as a method employed in jokes For the individual ideas which make up the dream thoughts are not all of equal value they have various degrees of affective tone attached to them and corresponding to these they are judged as more or less important and more or less worthy of attention In the dream work these ideas are separated from their affects the affects are treated separately They may be transferred to something else they may remain where they were they may undergo transformation or they may disappear from the dream entirely The importance of the ideas which have been shorn of their affect reappears in the dream in the form of the sensuous vividness of the dream pictures but we notice that this accent which should lie on important elements has been transferred to unimportant ones so that what seems to be pushed to the forefront in the dream as the most important element in it only plays a subsidiary role in the dream thoughts and conversely what is important among the dream thou hts obtains only incidental and rather indistinct representation in the dream No other factor in the dream work plays such an important part in rendering the dream strange and unintelligible to the dreamer Displacement is the chief method employed in the process of *dream distortion* which the dream thou hts have to undergo under the influence of the censorship

After these operations on the dream thoughts the dream is almost ready There is still however a more or less non constant factor the so called *secondary elaboration* that makes its appearance after the dream has come into consciou ness as an object of perception When the dream has come into consciousness we treat it in exactly the same way that we treat any content of perception we try to fill in the gaps we add connecting links and often enough we let ourselves in for serious misunderstandings But this as it were rationalizing activity which at its best provides the dream with a smooth façade such as cannot correspond to its real content may be altogether absent in some cases or only operate in a very feeble way in which case the dream displays to view all its gaps and inconsistencies On the other hand one must not forget that the dream work too does not always function with equal force quite often it limits its activity to certain parts of the dream thoughts while others are allowed to come into the dream unaltered In this event one has the impression that one has carried out the most complicated and subtle intellectual operations durin the dream that one has made brilliant peculations or jokes or that one has come to decisions or solved problems really however all this is the result of our normal mental activity and may just as well have happened during the day before the dream as during the ni ht It has nothing to do with the dream work nor does it di play any feature which is characteristic of dreams It is perhaps not superfluous once more to emphasise the distinction which subsists among the dream thou hts themselves between the unconscious impulse and the residues of the precedin day While the latter exhibit the whole variety of our mental activity the former which is the real motive force of the dream always finds its outlet in a wish fulfilment

I could have told you all that fifteen years ago in fact I actually did tell it you at the time Now let us bring together such modifications and new discoveries as have been mad during the interval

I have already told you that I am afraid you will find that there is very little to say so you will not understand why I have obliged you to listen to the same thing twice over and have obliged myself to say it But fifteen years have passed and I hoped that in this way I might most easily re establish contact with you And indeed these elementary matters are of such decisive importance for the understanding of psycho analysis that it is a good thing to hear them for a second time and the very fact that they have remained the same after fifteen years is in itself something worth knowing

You will naturally find in the literature of these years a great deal of confirmatory material and exposition of details of which I only

mised to give you examples. I can also add to this a certain amount that was already known before. Most of it has to do with symbolism and the other methods of representation in dreams. Only quite recently the physicians at an American university refused to allow that psycho-analysis was a science on the ground that it admits of no experimental proof. They might have raised the same objection against astronomy; experimentation with the heavenly bodies is, after all, exceedingly difficult. There one has to rely on observation. Nevertheless certain Viennese investigators have made a beginning at the experimental confirmation of our theory of dream-symbolism. Dr. Schrötter discovered as long ago as 1912 that when one orders a deeply hypnotized person to dream of sexual activities, the sexual material in the dream that is thus provoked is represented by the symbols which are familiar to us. For example, a woman is told to dream of sexual intercourse with a lady friend of hers. In her dream this friend appears with a travelling-bag which has a label pasted on it "Ladies only". Even more impressive are the experiments of Betlheim and Hartmann (1924) who worked with patients suffering from the so-called Korsakoff syndrome. They told these patients stories with a crude sexual content, and then noted the distortions which appeared when he was asked to reproduce what he had heard. Here again the symbols with which we are familiar as standing for the sexual organs and sexual intercourse cropped up, and among them the symbol of a staircase with regard to which the authors very properly observe that it would be impossible to a conscious intention to distort.

Silberer performed a very interesting series of experiments in which he showed that one can surprise the dream-work, as it were, in *flagrante delicto* and see how it translates the abstract thoughts into visual pictures. When he tried to force himself in a very tired and sleepy condition to perform an intellectual task, the thought often escaped him, and in its place would come a visual image, which was often a substitute for it.

Here is a simple example. The thought which he was setting before himself was that he must smooth out an uneven passage in an essay. His visual image was that he saw himself planing a piece of wood. It often happened in these experiments that what [illegible] the idea which was waiting elaboration that formed the content of the visual image but his own state of mind

while he was trying to make the effort—the subject's condition rather than the object, the content. This Silberer calls a "functional phenomenon". [illegible] will [illegible] how you what

of these views is always escaping him, and finally he has a vision of himself asking information of a cross-grained secretary who is leaning over his desk and disregards him at first, and then looks at him with a disagreeable expression as if he would like to send him about his business. It is probably due to the conditions of the experiment itself that the visual images which are aroused in this way so [illegible]

particular symbol got its particular meaning. In such cases any confirmation we could get from other sources, from philology, folklore, mythology or ritual, was particularly welcome. An example of this kind was the symbol of a cloak. We held that in a woman's dream a cloak stood for a man. I hope now you will be impressed when you hear that Reik (1920) tells us: "In the ancient marriage ceremony of the Bedouins, the bridegroom covers the bride with a special cloak which is called an 'aba' and at the same time utters the ritual words 'Let no man in the future cover thee but me!'" (from Robert Eisler, *Weltenmantel und Himmelszelt*). We have also discovered a great many new symbols, of which I will give you two examples. According to Abraham (1922) a spider in a dream is a symbol of the mother, but it means the phallic mother, whom one fears, so that the fear of the spider expresses the horror of incest with the mother and the abhorrence felt towards the female genitals. You know perhaps that the mythological figure of the Medusa's head is to be traced back to the same motif of castration fear. The other symbol of which I would like to speak is the symbol of the bridge. Ferenczi has explained it (1921, 1922). It stands originally for the male genital organ, which connects the parents with each other during sexual intercourse; but it develops into a wider set of meanings which spring out of the first. Since the male genital organ is responsible for the fact that one can emerge from the waters of birth into the world, the bridge develops the passage from "Yonder" (not yet-born

the other alterations to which the elements comprising the dream thoughts are subjected Such of them as have any point of contact are *condensed* into new unities When the thoughts are translated into pictures those forms are indubitably preferred which allow of this kind of telescoping or condensation it is as though a force were at work which subjected the material to a process of pressure or squeezing together As a result of condensation one element in a manifest dream may correspond to a number of elements of the dream thoughts but conversely one of the elements from among the dream thoughts may be represented by a number of pictures in the dream

Even more remarkable is the other process of *displacement* or transference of accent which in conscious thinking figures only as an error in thought or as a method employed in jokes For the individual ideas which make up the dream thoughts are not all of equal value they have various de rees of affective tone attached to them and correspondin to these they are judged as more or less important and more or less worthy of attention In the dream work these ideas are separated from their affects the affects are treated separately They may be transferred to something else they may remain where they were they may undergo transformation or they may disappear from the dream entirely The importance of the ideas which have been shorn of their affect reappears in the dream in the form of the sensuous vividness of the dream pictures but we notice that this accent which should lie on important elements has been transferred to unimportant ones so that what seems to be pushed to the forefront in the dream as the most important element in it only plays a subsidiary role in the dream thoughts and conversely what is important among the dream thoughts obtains only incidental and rather indistinct representation in the dream No other factor in the dream work plays such an important part in rendering the dream strange and unintelligible to the dreamer Displacement is the chief method employed in the process of *dream-distortion* which the dream thoughts have to undergo under the influence of the censorship

After these operations on the dream thoughts the dream is almost ready There is *still* however a more or less non constant factor the so called *secondary elaboration* that makes its appearance after the dream has come into consciousness as an object of perception When the dream has come into consciousness we treat it in exactly the same way that we treat any content of perception we try to fill in the gaps we add connecting links and often enou h we let ourselves in for serious misunderstandings But this as it were rationalizing activity which at its best provides the dream with a smooth façade such as cannot correspond to its real content may be altogether ab ent in some cases or only operate in a very feeble way in which case the dream displays to view all its gaps and inconsistencies On the other hand one must not forget that the dream work too does not always function with equal force quite often it limits its activity to certain parts of the dream thou hts while others are allowed to come into the dream unaltered In this event one has the impression that one has carried out the most complicated and subtle intellectual operations during the dream that one has made brilliant peculations or jokes or that one has come to decisions or solved problem really however all this is the result of our normal mental activity and may just as well have happened durin the day before the dream as during the night It has nothing to do with the dream work nor does it display any feature which is characteristic of dream It is perhaps not superfluous once more to emphasise the distinction which subsists amon the dream thou hts themselves between the unconscious impulse and the residues of the preceding day While the latter exhibit the whole variety of our mental activity the former which is the real motive force of the dream always find its outlet in a wish fulfilment

I could have told you all that fifteen years ago in fact I actually did tell it you at the time Now let us bring together such modifications and new discoveries as have been mad during the interval

I have already told you that I am afraid you will find that there is very little to say so you will not understand why I have obliged you to listen to the same thing twice over and have obliged myself to say it But fifteen years have passed and I hoped that in this way I might most easily re establish contact with you And indeed these elementary matters are of such decisive importance for the understanding of psycho analysis that it is a good thing to hear them for a second time and the very fact that they have remained the same after fifteen years is in itself something worth knowing

You will naturally find in the literature of these years a great deal of confirmatory material and exposition of details of which I only

provide a wish-fulfilment in two steps, a thing which each alone does not do. If a dream wish has as its content some piece of forbidden behaviour towards a certain individual, then that person may appear in the first dream undisguised, but the behaviour is only faintly indicated. In the second dream it will be the other way round. The behaviour will be openly shown but the person will be made unrecognisable or else some indifferent person will be substituted for him. It must be admitted that this gives one an impression of deliberate artfulness. A second and similar relation between two members of a pair of dreams is that in which the one represents the punishment and the other the sinful wish-fulfilment. It is just as if one said, "If I take the punishment on myself, then I can do the forbidden thing."

I must not detain you longer with such discoveries of matters of detail, nor with discussions of the uses of dream interpretation in analytic work. I am sure you are impatient to hear what alterations have been made in our basic attitude towards the nature and meaning of dreams. You will be prepared to hear that there is little to tell. The most hotly disputed point of the whole theory was undoubtedly the assertion that all dreams are wish-fulfilments. The inevitable and ever-recurrent objection from the laity that there are so many anxiety dreams has already been completely answered, I think, in my earlier lectures. We have kept our theory intact by dividing dreams into wish-dreams, anxiety dreams and punishment dreams.

Even punishment-dreams are wish-fulfilments but they do not fulfil the wishes of the instinctual impulses but those of the critical, censuring and punishing function of the mind. If we are faced with a pure punishment-dream, a simple mental operation will enable us to reinstate the wish-dream to which the punishment-dream was the proper rejoinder and on account of this repudiation the punishment dream has *appeared in place of the wish-dream* as the manifest dream. You know, ladies and gentlemen, that the study of dreams was the first thing that helped us to understand the neuroses. And you will not be surprised to hear that our subsequent knowledge of the neuroses has influenced our conception of the dream. As you will learn presently, we have been forced to assume the existence in the mind of a special criticising and forbidding function which we call the *super-ego*. We have recognised the dream-censorship as an activity of this function; we have been led to consider the part which the super-ego plays in dream formation in greater detail.

Only two serious difficulties face the wish-fulfilment theory of dreams, the examination of which leads us far afield and for which we have found no completely satisfactory solution. The first difficulty is presented by the fact that people who have had severe shocks or who have gone through serious psychic traumas (such as were frequent during the war and are also found to lie at the back of traumatic hysteria) are continually being put back into the traumatic situation in dreams. According to our acceptation of the function of dreams this ought not to be the case. What conative impulse could possibly be satisfied by this reinstatement of a most painful traumatic experience? It is indeed hard to guess. We meet with the second fact almost daily in our analytical work; it does not involve such a serious objection as the other. You know that it is one of the tasks of psycho-analysis to lift the veil of amnesia which shrouds the earliest years of childhood and to bring the expressions of infantile sexual life which are hidden behind it into conscious memory. Now these first sexual experiences of the child are bound up with painful impressions of anxiety, prohibition, disappointment and punishment. One can understand why they have been repressed, but, if so, it is difficult to see why they should have such easy access to dream life, why they should provide the pattern for so many dream phantasies and why dreams are full of reproductions of these infantile scenes and allusions to them. The pain that attaches to them and the wish-fulfilling tendency of the dream-work would seem to be incompatible. But perhaps in this case we exaggerate the difficulty. All the imperishable and unrealizable desires which provide the energy for the formation of dreams throughout one's whole life are bound up with these same childish experiences and one can well trust to their ability with their powerful upward thrust to force even material of a painful nature to the surface. And on the other hand, in the manner in which this material is reproduced the efforts of the dream-work are unmistakable; it disowns pain by means of distortion and turns disappointment into fulfilment. In the case of the traumatic neuroses it is quite different; here the dream habitually ends in anxiety. In my opinion we ought not to shrink from the admission that in such cases the function of the dream fails. I will not have

ness the womb) to Here (life) and since mankind also represents death as the return into the mother's womb (into the water) the symbol of the bridge gets the meaning of something that brings about death and finally further removed from its original meaning it indicates transition or any change of condition whatever That is why a woman who has not yet overcome her desire to be a man so frequently dreams of bridges which are too short to reach the other side

Very often pictures and situations appear in the manifest content of the dream which remind one of well known themes from fairy stories legends and myths The interpretation of such dreams throws light on the original motives which created these themes though naturally we must not forget the change of meaning which this material has undergone during the passage of time Our work of interpretation uncovers what one might call the raw material which often enough may be regarded as sexual in the broadest sense of the word but which has found the most varied application in later elaborations When we trace things back like this we very often arouse the rage of all investigators who do not share the analytical point of view as though we were seeking to deny or underestimate all the later developments which the raw material has undergone None the less such ways of looking at things are instructive and interesting The same is true of the tracing back of various motifs of plastic art—as for example when J Eisler (1919) guided by the dreams of his patients interprets analytically the young man playing with a little boy portrayed in the *Hermes* of Praxiteles Finally I cannot help mentioning how often mythological themes find their explanation through dream interpretation The story of the Labyrinth for example is found to be a representation of anal birth the tortuous paths are the bowels and the thread of Ariadne is the umbilical cord

The method of representation which the dream work adopts a fascinating and almost inexhaustible subject is constantly becoming better known to us as we study it more closely I will give you a few proofs of this The notion of frequency for instance is expressed in dreams by means of the multiplication of similars Listen to this remarkable dream of a young girl She goes into a hall and finds there a person sitting on a chair this figure is repeated six times eight times and even more but every time the person is her father This can easily be understood when one learns from the additional features which emerged in interpretation that the room represents the womb The dream then becomes equivalent to the familiar fantasy of the young girl who believe that she met her father during her intra uterine life when he visited the womb during her mother's pregnancy The fact that an element in the dream is turned the wrong way round that the act of entry is transferred from the father to the dreamer herself should not lead you astray it has indeed a special meaning of its own The multiplication of the father image can only mean that the procedure in question was frequently repeated But then the dream always turns temporal relations into spatial ones whenever it has to deal with them Thus one may see in a dream a scene between people who look very small and far away as if one were looking at them through the wrong end of a pair of opera glasses The smallness and the spatial remoteness here mean the same it is remoteness in time that is meant the interpretation being that it is a scene from the far distant past Besides this you may remember that in my previous lectures I showed you with the help of examples that we had learnt to make use even of the purely formal characteristics of the manifest dream for purposes of interpretation that is to say to turn them into the content of the latent dream thoughts Now you know of course that all the dreams of one night belong to the same context but it is by no means immaterial whether these dreams appear to the dreamer as a continuum or whether they are organized in several pieces and if so in how many The number of pieces often corresponds to the same number of distinct nodal points in the chain of thoughts which make up the latent dream thoughts or it may correspond to forces in the mental life of the dreamer which are struggling with one another and each of which finds its main (though not its exclusive) expression in one particular part of the dream A short introductory dream and a long main dream often stand to each other in the relation of condition and consequence of this you will find a very clear example in the old lectures A dream which the dreamer describes as somehow interpolated really corresponds to a dependent clause in the dream thoughts Franz Alexander in his essay on pairs of dreams that not infrequently two dreams which occur on the same night play separate parts in the fulfilment of the dream function so that taken together they

he who can get such an idea into his head or at the most we shall ask him where he got the idea from. The unfortunate inventor of the jam hypothesis will be very much offended, and will complain that we are refusing to consider an objective evaluation of this theory out of which he calls scientific prejudice. But his complaints will be in vain. Prejudices, we feel, are not always to be deplored, but are sometimes justified and they are useful in saving us unnecessary trouble. They are, indeed, nothing more than conclusions drawn by analogy from other well-founded judgments.

A whole number of occult theories make the same impression on us as the jam theory, so that we feel justified in putting them aside at the outset without testing them. But it is not quite such a simple matter. An analogy such as I have suggested—like all analogies—proves nothing. In any case it is doubtful whether it is a fair analogy and it is obvious that it was our attitude of scornful rejection which in the first instance determined our choice of it. Prejudices are very often useful and justified, but sometimes they are erroneous and harmful, and one never knows when they will be the one or the other. The history of science is full of examples which should warn us against too hasty condemnation. For a long time it was thought to be an absurd thesis that the stones which we now call meteorites should have reached the earth from outer space or that mountains the rocks of which contain remains of shells, could once have formed the bed of the sea. And, after all, not so very different the befell our psycho-analysis itself when it brought forward the discovery of the unconscious. We analysts therefore have special reason to be cautious in making use of intellectual arguments in the rejection of new theories and we must recognize that such arguments will not put us beyond the reach of feelings of aversion, doubt, and uncertainty.

I called the second factor psychological. By that I meant the general human inclination towards credulity and belief in the marvellous. From the very beginning when life imposes its stern discipline upon us there grows up in us a resistance against the restlessness and monotony of the laws of thought, and against the need for putting things to the test of reality. Reason becomes an enemy that keeps us from so many possibilities of pleasure. One discovers what joy it is to escape from it at least for a moment, and give oneself up to the fascination of irrationality. The schoolboy amuses himself by making up ridiculous plays on words, the specialist makes fun of his own work after a scientific congress, and even the serious-minded man enjoys an occasional joke. More serious antagonism against "Wisdom and Science, man's most prized powers," awaits its opportunity; it is eager to prefer the miracle-man or the natural healer to the *trained* doctor; it makes us warm towards the theories of the occult so long as its reputed facts can be taken as breaches of law and rule. It puts our critical faculty to sleep, falsifies our perception and forces us to confirm and agree without real justification. Any one who takes these human weaknesses into consideration has every reason to discount the value *of much of the* information contained in occult literature.

In referring to the third obstacle as the historical one I had in mind the fact that nothing new is to be found in the world of the occult. On the contrary, we meet again in it with all the signs, wonders, prophecies and apparitions which have been handed down to us from remote ages and in old books and which we long ago thought we had done with as being the offspring of unbridled imagination or tendentious fraud, the product of a time when the ignorance of mankind was at its height and when the scientific spirit was still in its infancy. If we accept as true what we are told by the occultists of our own day, then we must be prepared to believe the accounts which have come down to us from the past. And then we remember that the traditions and sacred books of all races are packed with such marvels and that religions base their claim to credibility precisely on such extraordinary and wondrous happenings and find in them the proof of the operation of superhuman forces. At this point it is hard for us *to avoid the suspicion that* occult interests are really religious ones and that it is one of the secret motives of the occultist movements to come to the aid of religious belief threatened as it is by the progress of scientific thought. The discovery of motive of this kind cannot fail to increase our mistrust and our disinclination to embark upon an investigation of these so-called occult phenomena.

But this disinclination must be overcome. The whole thing is really a question of fact: is what the occultists tell us true or not? It must be possible to decide this by observation. *At bottom* we ought to be grateful to the occultists. The tales of wonderful happenings which have come down to us from ancient days are beyond our powers of testing. If we say that they can

recourse to the saying that the exception proves the rule the validity of this phrase seems to me very dubious But at any rate the exception does not do away with the rule If for the purposes of investigation one isolates from every other mental process a single psychic activity like the dream one is enabled to discover the laws which govern it if one then puts it back into its place one must be prepared to find that one s discoveries are obscured and interfered with when they come into contact with other forces We assert that the dream is a wish fulfilment in order to take these last objections into account you may say that the dream is an *attempted* wish fulfilment But for those who have an understanding for the dynamics of the mind you will not be saying anything different Under certain conditions the dream can only achieve its end in a very incomplete way or has to abandon it entirely an unconscious fixation to the trauma seems to head the list of these obstacles to the dream function The sleeper has to dream because the nightly relaxation of repression allows the upward thrust of the traumatic fixation to become active but sometimes his dream work which endeavours to change the memory traces of the traumatic event into a wish fulfilment fails to operate In these circumstances the result is that one becomes sleepless one gives up all idea of sleep because of one s fear of the failure of the dream function The traumatic neurosis is an extreme case but one must also attribute a traumatic character to infantile experiences as well so one need not be surprised if lesser disturbances of the function of the dream occur in other circumstances

LECTURE 30

DREAMS AND THE OCCULT

LADIES AND GENTLEMEN Today we are to travel along a narrow path but it may lead us to a wide prospect

When you hear that I am going to talk about the connection between dreams and the occult you need hardly feel surprised Dreams are indeed often regarded as the portal to the world of mysticism and even today seem to many to be in themselves an occult phenomenon Even we who have made them an object of scientific study cannot deny that several strands link them up with those obscure regions Mysticism —occultism—what is meant by these terms? Do not imagine that I shall attempt to provide you with a clear definition of such hazy concepts In a general and vague way we all know what we mean by the terms They refer to a kind of other world which lies beyond the clear world with its inexorable laws which science has built up for us

Occultism assumes that there are in fact more things in heaven and earth than are dreamt of in our philosophy Well we need not be tied down by the narrow mindedness of the Schools we are ready to believe whatever is made plausible to us

We intend to treat these things in just the same way as we treat any other material for scientific investigation First we have to establish whether these processes really occur and then but only then when there is no doubt as to their actuality we can set about their explanation But we cannot hide from ourselves the fact that even the first step will be made difficult for us by intellectual psychological and historical factors It is by no means the same as when we start on any other investigation

Let us consider the intellectual difficulties first Allow me to give you a crude obvious explanation of what I mean Supposing we are dealing with the constitution of the interior of the earth Admittedly we know nothing certain about it We suppose that it consists of heavy metals in a molten condition Now let us imagine that some one asserts that the interior of the earth is made of water impregnated with carbonic acid that is to say a kind of soda water We shall certainly say that it is very improbable that it runs counter to all our expectations and that it does not take into consideration the scientific data which have led us to put forward the mental hypothesis But for all that it is not unthinkable If any one shows us the way to prove the soda water hypothesis we shall follow it without any resistence But now another person comes along who seriously asserts that the centre of the earth is made of jam We shall behave quite differently toward his theory We shall say to ourselves that jam is not a product of Nature but of human cookery moreover the existence of that material presupposes the presence of fruit trees and their fruit and we cannot see our way to placing vegetation and human cookery in the centre of the earth The result of this intellectual objection will be a diversion of our interests instead of their being directed on to the investigation itself as to whether the interior of the earth is really made of jam or not we shall wonder what kind of man it must

at the time that this is no the ca e that I ha e not committed myself t any conclusion on the subject.

As a ma ter of fact I ha e but l ttle to tell you—on one modest fa t. A d I will further damp your expectations by inf rming you that fundamen all the dream has but little to d with t epath T lepathy throws no new light on the na ure f th dream, nor does the dream bear witness for the real of telepathy T epathic phenomena are al o by no manner of means confined to dreams t ey can also manifest themselves during wakin lif The only ground for mentioning the con ection between dreams and telepathy s that the co di ion of sleep seems to be especiall uitable for the reception f telepathic communication If then on comes across a so-called *t l pa h c dream* on can con ince oneself by its anal sis that the telepathic message has pla ed the sam as th r resid of waking lif and as such has been a tered by the dream-work and mad to serv ts purpo e

Now in the cours of th anal sis of a t l pathic dream f this kind som hing occurred which seems to me of ufficient importanc in spite of s light ess, t serve as the startin point for this lect re When in t ear 19 2 I brought up this subject f r the first tim I had only on bservatio t my disposal Since then I ha e made se eral ther observations but I shall keep to th first example because t the easiest on to describe and I hall proceed at one t th heart f the matter

An obviously int lligent man and on who cording to his own estimat on wa in n wa tainted with occultism wrote to me about a dream whi h eemed to him t be remarkabl He pref ced his story with th nformat on that his married daught who lived som distance from him wa expecting her first confinement in the midd e of December H was ery m ch dev ted t this daughter and he knew that h was very m ch t tached t him Now h dreamed in the night between th 6th and th of November that his wif had had twin There followed ev eral detail wh h I can pa ov here not ll f which have found satisf ct ry explanat on. The woman wh in the dream, had become the mother f the twin was his second wif the daughter tep-mothe H did ot wi h t have child en by this woman w om h did ot onsider fitted for bri ging up hildren in an understandin way and t th time f th dream h had for long tim given up sexual intercourse wi h her What induced h m to write to me was not a doubt abou the valid ty of the theory of d eams thou h the manifest d eam would ha e just fied him if that had been the case for why does the dre m n flat contradiction to his wi hes depict this woman as bearing children? And acc rd g to h s story he had no grounds fo fearing that th s un wi hed-for occurrence might take place What d termined him to t ll me about his dream was the fact that early in the mornin of No ember 18th he rece ed a te egram to say that h s daughter had given b rth to twins The telegram had been handed in the day before a d the b rth had taken place during the n ht between the 16th and t th at abo t the same t me that he had dreamt that h s wife had had twin The d eamer a ked me whethe I thou h that the simultane ty of the dream and the e ent was a mere coincidence He d d n t go so far as to call th dream a telepath c one because the diffe ence between th co tent of th dream a d t e event it elf concerned precisely what he con d red t be the mo t important po n th pers n who had the children But from one of his rema ks t looked s thou h he would n t ha e been urprised if he had had a real tele pathic dream Hi da ghter he f l certain, had th ught especiall about him during labour

Ladies and Gentlemen I m su e that you can already explain the dream and that ou understa d wh I ha told it to y u Here is a man dissatisfied with h econd wif wh w uld pr fer to ha e a wife like his daughter by his first marriage In th unconsci us this *l ke* is naturally omitted Now during the n ght he rec es th t lepathic communicat on that h s daughter has had twins The dream w rk eizes on this information llows his un on sciou wi h that hi da ghter ho ld replace his co d wif to act upon it, and thus emerges the ingua manifest dream in which the wish tself eiled a d the message dist rted We must dmit that nly dream nt rpretat on has shown us that this is a telepathic dre m psy cho-analys s has discovered t lepathic event which we hould ot therwi e ha e recognized s uch.

B t d n t l t yoursel es be led astray In sp of all this d eam int rpret on has sa d n thing about t e bjective truth of telepathi phenomena It ma be only n ppearance w ch can be explained in some o he wa It is po ib that the m latent dream thoughts ran l k this "Toda is the day on whi h the con nement must take place if my daughter

not be proved we must at least admit that strictly speaking they cannot be disproved But about what happens in the present about things which we can actually witness we ought to be able to reach a definite conclusion If we are convinced that such wonders do not occur nowadays we need not fear the objection that they might have occurred in days gone by Other explanations will then be far more plausible We have then put aside our scruples and are ready to take part in the observation of occult phenomena

Unfortunately we come up against considerations which are highly unfavourable to our laudable intentions The observations on which our judgments must depend have to be made under conditions which render our powers of perception insecure and which blunt our faculty of attention the phenomena take place in the dark or in the faint glimmer of a red light after long periods of fruitless waiting We are told that even our sceptical—that is to say our critical—attitude may very well prevent the hoped for phenomena from manifesting themselves The situation which thus arises is simply a caricature of the conditions under which we are used to carrying out scientific investigations The observations are made on so called mediums persons to whom are ascribed special sensitive gifts who however do not display outstanding qualities of intelligence or character and who are not moved as the old wonder workers were by some great idea or by some serious purpose On the contrary they are regarded as particularly untrustworthy even by the people who believe in their mysterious powers most of them have already been unmasked as frauds and we are tempted to expect that the same will happen with the rest as well Their performances remind us of the mischievous pranks of a child or of a conjuror s tricks Nothing of any value has so far ever come out of these *séances* with mediums no new source of energy has become accessible to us And to be sure one does not expect any advances in our knowledge of pigeon breeding from the tricks of a conjuror who produces pigeons out of an empty top hat I can easily put myself into the position of a man who wishes to fulfil the demands of objectivity and therefore takes part in these occult *séances* but tires of them after a while and put off by what is required of him gives up the whole business and returns to his prejudices no wiser than before To such a man one might object that his behaviour is not right and that if one is going to investigate phenomena one cannot decide beforehand of what nature they shall be and under what conditions they shall manifest themselves It is on the contrary his business to persevere and form some estimate of the precautionary measures of control which are used nowadays as a protection against the untrustworthiness of mediums Unfortunately the modern control technique puts an end to the easy accessibility of occult observations The study of the occult has become a specialized and difficult pursuit a form of activity which one cannot carry on side by side with one s other interests And until the investigators who have given their mind to it have come to some conclusion one is necessarily given over to doubts and to one s own conjectures

Among these conjectures the most probable is I think that in occultism there is a core of facts which have hitherto not been recognized and round which fraud and phantasy have woven a veil which it is hard to penetrate But how can we even approach this core? at what point can we grasp the problem? It is here it seems to me that the dream comes to our aid by suggesting to us that we should pick out the theme of telepathy from all the confused material that surrounds it

You know that by *telepathy* we mean the alleged fact that an event which occurs at a specific time comes more or less simultaneously into the consciousness of a person who is spatially distant without any of the known methods of communication coming into play The tacit assumption is that this event occurs to a person in whom the receiver of the message has some strong emotional interest Thus for example a person A has an accident or dies and a person B some one closely connected with A his mother or daughter or loved one learns of it at about the time of its occurrence through a visual or auditory perception in the latter case it is as though they were in telephonic communication which however they are not in fact it is a kind of psychic parallel to wireless telegraphy I need not emphasize to you the improbability of such processes and anyway there are good grounds for rejecting the majority of such reports Some of them are left over which cannot be rejected so easily I must now ask you to allow me to leave out the precautionary word *alleged* for the purposes of what I have to tell you and to let me continue as though I believed in the objective reality of telepathic phenomena But you must remember

ed have two children by the time she was thirty-two years of age. When she told me this story she was forty-three, very ill and with no expectation of ever having a child at all. The prophecy therefore had not come true, and yet she spoke of it with no bitterness whatever, but with an unmistakable expression of satisfaction, as though she were looking back with pleasure upon a happy experience. It was easy to assure oneself that she had not the slightest idea what the two numbers in the prophecy might mean, or whether they meant anything at all.

You will say that this is a stupid and incomprehensible story, and ask why I have related it to you. Now I should feel exactly as you do but for the fact—and this is the important point—that the analysis enabled us to obtain an interpretation of the prophecy which was actually most significant when it came to the details. For the two numbers have a place in the life of the *mother* of my patient. She had married late, when she was more than thirty, and her family had often remarked how successful she had been in making up for lost time. Her two first children—and our patient was the elder of these—had been born within a single calendar year with the smallest possible interval between them, and it was really true of her that by the time she was thirty-two she had two children. What Monsieur le Professeur told my patient meant this: 'Cheer up, for you are still young. You will have the same experience as your mother, who also had to wait a long time for children, and you will have two children by the time you are thirty-two.' But to have the same experience as her mother, to be in her position, to take her place with her father was the strongest wish of her childhood, the wish whose non-fulfilment was beginning to make her ill. The prophecy promised her that it would be fulfilled, how could she feel otherwise than friendly towards the prophet? But do you think that Monsieur le Professeur could really have been familiar with the dates of the intimate family history of a chance client? It is impossible; whence then came the knowledge that enabled him to express in his prophecy the strongest and most secret wish of my patient by bringing in these two numbers? I can see only two possibilities. Either the story as she told it to me was not true and the events were different, or we must accept thought transference as a real phenomenon. It could, no doubt, be argued that my patient after the lapse of sixteen years had carried over the two numbers we are discussing from her unconscious into her recollection. I have no evidence for this suggestion, but I cannot rule it out, and I imagine that you would prefer to believe in such an explanation rather than in the reality of thought transference. If, however, you should accept the latter view, do not forget that it was only analysis that brought to light the occult element which had been distorted out of all recognition.

If we had to deal with only one case like that of my patient, we should turn away from it with a shrug of the shoulders. It would not occur to any one to base a belief which has such far-reaching implications on an isolated observation. But I can assure you that this is not the only case in my experience. I have collected a whole set of such prophecies, and I have the impression that in every instance the fortune-teller has only given expression to the thoughts, and particularly to the secret wishes of his clients, so that we are justified in analysing such prophecies as if they were the subjective productions, phantasies or dreams of the people concerned. Naturally not all cases have equal evidential value, nor in all cases is it equally possible to rule out more rational explanations, but taking all the evidence together there remains a heavy weight of probability in favour of the reality of thought transference. The importance of the matter would justify my putting all my cases before you, but I cannot do that because the material would be of inordinate length and would inevitably involve a breach of professional secrecy. I will try to salve my conscience as far as possible by giving you one or two more examples.

One day a very intelligent young man came to see me. He was a student preparing for his final medical examination, but he was not in a condition to take it, because, as he complained, he had lost all his interests, all power of concentration, and even the faculty of well-ordered memory. The history of this paralysing condition was soon unravelled; he had fallen ill after carrying through a line of conduct which had necessitated great self-discipline. He had a sister towards whom he felt, just as she did towards him, an intense but always restrained affection. They had often enough said to each other: 'What a shame it is that we cannot marry!' An unobjectionable man had fallen in love with the sister, and she had returned his feeling, but her parents would not give their consent to the union. The couple had

as I incidentally believe is the case has been a month out in her calculations And her appearance when I saw her last time was such that it looked as though she was going to have twins And my dead wife was so fond of children how delighted she would have been by twins! (The last point is derived from associations of the dreamer which I have not yet mentioned) In that case the stimulus for the dream would have been well founded suspicions on the part of the dreamer and not a telepathic message the result would have been the same in both cases You notice that even this interpretation has told us nothing about the question of whether one should assign objective reality to telepathy One could only come to a conclusion about that after making detailed enquiries into all the circumstances of the case which unfortunately was impossible with this example as it was with all the others in my experience We may grant that the assumption of telepathy gives us by far the simplest explanation but that does not carry us very far The simplest explanation is not always the right one truth is very often not simple and one must act with the greatest caution before committing oneself to such a far reaching assumption

We can now leave the subject of dreams and telepathy I have nothing more to say about it But I want you to notice that it was not dreams that seemed to teach us something about telepathy but the interpretation of the dreams the psycho analytic treatment of them We can therefore leave dreams on one side in what follows and we will examine further our suspicion that the application of psycho analysis may throw a light on other so called *occult facts* There is for example the phenomenon of thought transference which is closely allied to telepathy and indeed can be identified with it without much difficulty It is held that psychological processes ideas states of excitement volitions which occur in the mind of one person can be transferred throu h space to another without the usual means of communication (words or signs) being employed Incidentally it is remarkable that it is actually these phenomena which find the least mention in the old accounts of the miraculous

During the psycho analytic treatment of patients I have had the impression that the activities of professional fortune tellers provide an admirable opportunity for making really satisfactory observations of thought transference It is usually mediocre and even inferior people who carry on practices of this sort deal out cards study writing and the lines upon the hand or make astrological reckonings and foretell the future of their visitors after having shown some knowledge of their past or present history Their clients usually express themselves as satisfied by their performances and bear them no ill will if their prophecies do not come true in the end I have come across a great many such cases and have been able to study them analytically I will tell you the most remarkable instances of the kind Unfortunately the evidential value of this information is reduced on account of the numerous omissions which are necessitated by the rules of professional secrecy I have however carefully avoided any distortions This is the story of one of my female patients who had an experience of the kind we are discussing with a fortune teller

She was the eldest of a family of brothers and sisters grew up with an extraordinarily strong attachment to her father had married young and had found entire satisfaction in her married life There was only one thing wantin to make her happiness complete she was childless and thus the husband whom she loved could not wholly fill the place of her father When after many years she decided to have a gynaecological operation her husband disclosed to her the fact that the fault lay in him that through an illness which had occurred before marriage he had been rendered incapable of procreating children She took this disappointment very badly became neurotic and suffered unmistakably from dread of the husband s attempts In order to cheer her up her husband took her with him on a business visit to Paris While they were there they were sitting one day in the hall of the hotel when she noticed a stir among the hotel servants She asked what was happening and learnt that Monsieur le Professeur had arrived and was giving consultations in a certain room She expressed her wish to see what the thing was like herself Her husband tried to dissuade her but when he was not looking she slipped into the room where the fortune teller was giving his consultations She was twenty seven years old but looked much younger and she had taken off her wedding ring Monsieur le Professeur told her to rest her hand on a bowl filled with ashes carefully studied the imprint and after telling her all sorts of things about severe troubles which lay before her concluded with the comforting assurance that she would get married all the same

yrm woman some years older than him elf n t pa ocnat wa that was characteristic of him She rejected him, and he thereupon at mpted suicide nor can we oubt the seri ousnes of his intentio It was o ly b a mir that he escaped de th and t was onl a er careful nursing that he reco ered. But the reckles act made a deep imp ess on upon the woman h was in lo e with he esponded t h tenti s and became his mi tress From that time onwards he had a deep attach ment to her and served he in a tru devoted man Aft r more than two decades when they had both lost mething of the r outh the woman naturally more than he he fel the need f detac in him lf from her he wanted

sprang up in him th l g uppres ed need for revenge upo her Ju t a at first h had tried to commit suicid him elf bec use e rejected him, so ow h wanted to have the sat facti of seem her seek destruct o because he was leaving her But his lo e w s till too trong for this wish t become con cious was he b e to bear e badl en ugh to her t dri her to commit uicide In th frame of mind, h took on the mistress wh m I first mentioned a a kind f whipping-boy in order to satisf his thirst f reven e *corpore vil* nd inflicted on her ll th injuries lculated to produc in her the effect h desired to produce in the woman h lo ed. Th f ct that th reveng was a tuall directed toward the l tt was nly betrayed by the cumstances that he made her confederate and ad isor in hi lov ffai instead of h ding his l pse from he The un fortunat woman wh had sunk from the posi tion of giving f urs to that f recei in them p bably suff red f om his confiden es m re than the w mistress did from his bru ti ty The bses on f whi h h complained m ref ren e to th latter and wh ch brought him under analyti t tment had naturally been transferred f m his first mis ress t he was from his first m tress that h wanted to free hims lf and could n t. commit suicide during the next few days had once more only brou ht to l ght a very strong sec et wish on the part of the person who was askin h s pinion Som thing similar happened in the case of the econd report, only that h re we are not concerned with an uncon cious wi h here it was the incip ent doubts and anxiet es of the inquirer that found o ert ex pression through the mouth of the handwriting special s I may add that my patient was able with the help of analysis to make a love-choice out id the magic circle within which he had been pell bound

Ladies and Gentlemen—You have now heard what dream interpretation and psycho-anal s can do for occultism You ha e seen in general by means of examples that th ough the applica t on of ps cho-anal t c theory occult phenom ena have been revealed wh ch would otherwise ha e rem ed unrecognized The question which doubtless interests you most, whether we ought to believe in the object e reality of the phenomena is one which ps cho-anal sis can ot answer directl but at lea t the ma terial which it has helped to brin to light s f ourabl to an affirmative reply But your i terest will not stop there You will want to know to what conclusion that far richer vein

omething to d w th psycho-an lys s in t ense that they were mad during a al t c l t eatment and were pe haps rend red po ble b m an f it I will gi e ou o e example th ne which I ft th t o gest impress on with m it will be lon winded and you will ha e to keep a numbe of details in your mind a d even so a great deal wil ha e to be om tted wh h increa ed th evidential alue of the bservation It is an in tance in wh ch th phe nomena in which we nter ed came t l ht quite b ously and did n t ha e t be b ught ou by analysis I di cussing , how ev w h ll n t be ble t do without nalv sis. But I ought to warn you beforehand that eve this exampl of pparent th ught trans f rence in the an lytic s tuation is not p oof again t all objections, and does not warrant un onditional acceptanc f the reality of oc cult phenomena

Th story is this One umn da in th yea 19 9 t bout 10.45 A.M Dr D id Forsyth who had just arrived from London

turned to my patient for help and he had not refused it He had enabled them to correspond with each other and it had been due to his influence that the parents had eventually been persuaded to give their consent While they were engaged a chance occurrence had taken place whose significance it is easy to guess He and his future brother in law undertook a difficult climb without a guide they lost their way and were in danger of never returning alive Shortly after the marriage of his sister he had fallen into his present state of mental exhaustion

When he had become able to work as a result of psycho analysis he left me to take his examination but after he had got through it he came back to me in the autumn of the same year for a short period He then told me of a remarkable experience which he had had before the summer In his university town there lived a fortune teller who carried on a very successful practice there Even the princes of the reigning house used to consult her regularly before undertaking any important step The way in which she worked was very simple She asked for the facts concerning the birth of the person involved but wanted to know nothing else about him not even his name She then consulted her astrological books made long calculations and in the end made a prophecy about him My patient decided to make use of her secret arts in connection with his brother in law He visited her and gave her the requisite data about him. After she had made her calculations she pronounced the following prophecy This person will die in July or August of this year of poison from eating crabs or oysters My patient finished his story by explaining And that really was marvellous!

From the very beginning I had listened to his story without enthusiasm and after this exclamation I permitted myself to ask What is it that makes you find this prophecy so marvellous? We have already reached the late autumn and your brother in law is not dead yet or you would have told me long ago The prophecy therefore has not come true The prophecy—no he said but the remarkable thing is this My brother in law is passionately fond of crabs and oysters and last summer that is to say before my visit to the fortune teller he was poisoned by eating oysters and nearly died of it What could I say about it? I could only feel distressed that such an intelligent man and moreover one who had a satisfactory analysis behind him should not have seen through the whole thing more clearly For my part before I believe that one can calculate the onset of shellfish poisoning by consulting astrological tables I would rather suppose that my patient had not yet overcome his hatred towards his rival the repression of which had caused his own illness and that the lady astrologer simply gave voice to his own hope People never give up such tastes and one day they will really be the end of him I admit that I can find no other explanation for this case except perhaps that my patient was making a joke at my expense But neither then nor later did he give me any ground for such a suspicion and he seemed to mean quite seriously what he said

Here is another case A young man of good position had a mistress and showed a remarkable obsession in his relations with her From time to time he was impelled to wound her feelings with insulting remarks till she was reduced to despair When he had got her into this condition he felt relieved made it up with her and gave her presents But now he wanted to free himself from her for the obsession was becoming a worry to him he noticed that his professional life was suffering from the relationship and wanted to have a wife and family of his own Since however he could not get away from his mistress by his own efforts he came to analysis for help After one of these scene which occurred during the analysis he got her to write him a few words on a piece of paper and showed it to a graphologist The information he received from him was to the effect that this was the handwriting of a person in the depths of despair who would certainly commit suicide in the course of the next few days That event did not indeed come about for the lady remained alive but the analytical treatment enabled him to free himself from his fetters he left the lady and turned his attentions to a young girl who he thought would make him a good wife Soon afterwards he had a dream which could only be explained as due to an incipient doubt about the young girl s worth He obtained a specimen of her handwriting as well which he placed before the same authority and received a judgment on it which confirmed his anxieties He therefore gave up his intention of making her his wife

To estimate the reports of the handwriting expert and particularly the first one at their proper value one must know something of the private history of our subject In his early adolescent years he was madly in love with a

hd t someone who had a ked h m that the E ... i r 4 p m was a mare s nest That s of c urse ab rd becau e a mare s nest means ot ... f the sort and the correct tr ... h on o *Al t c m s* n gh mare This assoc ... eemed to ha e othin mo e in co ... n w th the others tha the element of E ... k but he reminded m of a tri ial oc currence which had happened about a month before P was tting in my room with me ... m t re ppeared quit unexpectedl an other we com guest from Lo do Dr Erne t Jones ... om I had not seen for a l ng t me. ... ed to h m t go into my other room until I h d finished w th P The latter recognized him at once h wever from a photograph of him which hung in the waiting room nd even asked to be in rod ced to h m. ... f this ca e is undermined by a chanc factor

sent in his card while I was working with a patient (My respected colleague from the University of London will I feel sure not think I am being indiscreet if I tell you that he came to me for some months to be initiated into the mysteries of psycho analytical technique.) I had only time to say How do you do? and arrange an appointment for later on Dr Forsyth had a special claim upon my interest for he was the first foreigner who came to me after the isolation of the war years and seemed to be a harbinger of better times Soon after this at eleven o clock my next patient arrived a Mr P an intelligent and charming man of between forty and fifty who had come to me because he experienced difficulties in sexual intercourse with women In his case there was no prospect of bringing about a cure and I had long ago suggested that he should break off the treatment but he had preferred to continue it obviously because he felt comfortable in a well tempered father transference upon myself Money played no part at this time because there was too little of it about The hours I spent with him were stimulating for me as well and a relaxation and so setting aside the strict rules of medical etiquette, we were going on with the analytic treatment for a specified length of time

On this particular day P reverted to his attempts at sexual intercourse with women and mentioned once more the pretty piquante girl in poor circumstances with whom he might have been successful if only the fact of her virginity had not frightened him off from taking any serious steps He had often spoken of her but that day he told me for the first time that she though naturally she had not the slightest idea of the real grounds of his difficulty used to call him Mr Foresight *(Vorsicht)* I was much struck by this piece of information Dr Forsyth s card was beside me and I showed it to him

These are the facts I dare say they will seem to you to be rather thin but if you will have patience you will find that there is more to come

P had spent some years of his youth in England and had retained a lasting interest in English literature He possessed a well stocked library of English books which he used to lend me and it is to him that I owe my acquaintance with authors such as Arnold Bennett and Galsworthy of whose works I had so far read but little One day he lent me a novel by Galsworthy called *The Man of Property* the subject of which is an imaginary family named Forsyte Galsworthy s imagination was obviously captured by this creation of his because in the later stories he repeatedly went back to members of this family and eventually collected all the stories which had to do with them under the heading of *The Forsyte Saga* Only a few days before the event I am telling you about P had brought me a new volume out of this series The name Forsyte and all that it typified for the author had played a part in my conversations with P it had become a part of the private language which so easily grows up between two people who see each other regularly Now the name *Forsyte* out of the novels is not very different from that of my visitor *Forsyth* (as pronounced by a German indeed they are hardly distinguishable) and the expressive English word *foresight* which means *Voraussicht* or *Vorsicht* would be pronounced in the same way P had therefore produced from his own personal experiences a name that was in my mind at the same time on account of a circumstance quite unknown to him.

As you see we are making some progress But I think we shall be even more strongly impressed by this remarkable occurrence and get some sort of insight into the condition of its origin if we turn the light of analysis on to two other associations which P brought up during the same hour

First One day in the preceding week I was expecting Mr P at 11 o clock, but he had not appeared and I went out to pay a call on Dr Anton von Freund at his pension I was surprised to find that Mr P lived on another floor of the same house in which the pension was. Referring to this later I told P that I had in a sense paid him a visit at his house but I am absolutely certain that I did not mention the name of the person whom I had visited in the pension and now soon after the mention of Mr Foresight he asked me the following question Is the lady called Freud-Ottorego who gives the English course at the Volksuniversitat your daughter by any chance? And for the first time in our long acquaintance he let slip the distorted form of my name, to which officials clerks and printers have accustomed me instead of Freud he said Freund.

Secondly At the end of the hour he told me a dream out of which he had awakened with a feeling of anxiety a regular *Alptraum (nightmare)* he called it He added that he had recently forgotten the English word for it and

had t som o e who had led him that the E f r Alptraum was mare nest That is o course absurd because a mare s nest means not of the sort and the correct tr on Alptr m s 'n ' mare This asso on seemed to ha e nothin more in common with the others than the element of English but h reminded me of tri al oc currence which had happened about a month before P was sitting in m room with me when there appeared quite unexpected an other welcome guest from London Dr Erne t Jones whom I had not seen for a l time. I nod ed to him to go into my other room until I had finished with P The latter recognized him once h wever from a photograph f him which h m in the waiting room, and even a ked to be introduced to him Now Jones i the auther f monograph on the n ghtmare. I did ot know whether P was acquainted with the book he a oided reading analytical literature

At this point I hould like to con d r what analytical understandin we can obtain of P s associations and their motivat ons P had the same t d t wards the name Forsyte as I had meant the same t him t d d to me and in fact it wa t him that I owed my k edge of the name. The remarkable thing was that h brought this nam into the analysis immediately after t had acquired another meaning f r m through a recent experience, namely the arrival f th physician from London. But pe haps not less interesting is the way in w h the nam cam up in his analytical hour H did sa "Now th nam Forsyte out f t ovels you have read, comes int my mind but without any conscious reference t the source, h managed t weave in his own personal experiences and brought t the surface in that way—a t which h might have happened long before but which had not as matter of f ct occurred until ow At this juncture however h said I am F syt too f r that is what t g l called m One cannot mistake th mixture f exacting jealousy and p inful self-depreciation which finds ex pression in this utterance W all n go f wrong if we com ete t s I am hurt th t your thoughts should be so much wrapped up in t newcomer Come back t me f er all I m F syth too—or rather only Mr Fore-sth as t g l called m And now start from t idea f E gish he train f thought worked back t two ea er situations which might very well have aroused the same jealousy

in him A few d ys ago you paid a sit at my house b t alas it wa not to me it was t a Herr von Freund Th s idea made him d tort the name Freud into Freund The name Freud Ottorego from the lecture li t came in becau e as th nam of a tea her of E li h it pa red the wa f r the manifest a ociat on And now the memory of another vi tor of a few weeks back presented it. If a vis tor toward whom he cer tainly felt ju t as jealous this visitor (Dr Jones) was at the same time in a superior posi tion to him, becau e he could write a book about nightmares while the best he could do was to have n htmares him lf The allu ion to his mistake about the meanin of a 'm re s nest belonged to the ame con ect on it must mean I am not a proper Engl hman after all any more than I am a proper Forsyth.

N w t could n t be said that his jealous feelings w re either inappropriate or i compre-hen ble He had lread been made aware that his analysis and with it our relations, would

what we ha e just been doing has been a piece of anal t cal work the explanation of three ideas wh ch w e brought up in the same hour and were determ ned b the same moti at on Thi has not much to do with the quest on

have known th name of the person whom I vi ted in his house D d he know that Dr Jones had written book about n ghtma es? Or was t only m knowledge of these things which was displa ed in the deas that came into his head Whether this observation of mine leads to a concl on in favour f th ught transference depends on th a wer which is gi en to thes separate questi ns Let u lea e the first question aside f r the moment as the two thers are eas to deal with. The ca e of the vi t th pension strikes one at first gh as being very con incing I am qu ure th t in my short humorous mention of my t to his house I did n t mention any name I think t is most improbabl that P mad inquiries in the pension t d cover th nam f the person I had called on in f ct, I believe that he never knew of his existence But t ev dent al al f t is ca e is undermined by chance factor

The man whom I had been to see in the pension was not only *called* Freund but was indeed a true friend to us all It was he who e generosity had made pos ible the founding of our pub i h ing house His early death and th of Karl Abraham a few years later were the mo t seri ous mi fortunes which have befall n the de velopment of psycho analysis It is possible therefore that I said to Mr P I have been visiting a *friend* at your house and with this possibility the occult interest of the second as sociation evaporates

The impression made by the third asso ia tion too soon fades Could P have known that Jone had published a monograph on the night mare seeing that he never read analytical lit erature? Yes he could He possessed books issued by our publishing house and he might certainly have seen the titles of new publica tion printed on the covers It cannot be proved but it cannot be disproved Along this road then we can come to no decision This example of mine I regret to say is open to the same objections as so many others It was written down too late and came up for di cus ion at a time when I was not seeing Mr P ny more and could not ask him any further questions

Let us return to the first association which even by itself would support the alleged occur rence of thought transference Could P have known that Dr Forsyth had been with me a quarter of an hour before him? Could he even have known of his existence or of his presence in Vienna? We must not give way to the temp tation to answer both questions straight oft in the negative I might very well have told Mr P I was expectin a physician from England for training in analysis the first dove after the deluge This might have happened in the sum mer of 1919 Dr Forsyth had made arran e ments with me by letter months before his arrival I may even have mentioned his name thou h that is most improbable In view of the other a ociation which the name had for us both the mention of it would inevitably have led to a conversation of which ome trace at le t would have been preserved in my mem ory Nevertheless such a conversation may have taken place and I may have totally forgotten it so that it became possible for the mention of Mr Fore ight in the analytical hour to strike me as miraculous If one regards oneself as a sceptic it is well from time to time to be ceptical about one s scepticism Perhaps I too have that ecret leaning towards the miraculous which meets the production of occult phe nomena half way

Even if one part of this miraculous occur rence is thu explained away we till have an other part on our hand and that the most dif ficult part of all Granted that Mr P knew that there was such a person as Dr Forsyth and that he was expected in Vienna in the au tumn how was it that my patient became en sitive to him on the very day of his arrival and immediately after his fir t vi it? We might say that it was chance that is w might leave it unexplained but I have mentioned the two other ideas which occurred to Mr P preci ely in order to exclude chance in order to show you that he really was occupied with jealou thoughts directed against people who visited me and whom I visited Or if we are anxiou not to overlook anything even remotely pos sible we might suppose that P noticed that I was in a state of unusual excitement a state of which I was certa nly not aware and that he drew hi inference from that Or that Mr P who after all had arrived only a quarter of an hour after the Engli hm n had met him in the immediate neighbourhood of my house that he had recognized him from his typically En lish appearance and with his jealous feelin s on the alert had immediately thought Ah there is Dr Forsyth whos arriv l means the end of my analysis and probably he has ju t left the Professor I cannot go any furth r into these rationalistic hypothe es We are left once more with a *non liquet* but I must con fess that here too I feel that the balance is in favour of thought transference For the matter of that I am certainly not the only person who has met with *occult* phenomena in the analytic situation Helene Deut ch in 1926 reported some observations of the same kind and studied the way in which they were conditioned by the relation of transference between the patient and the analyst

I am sure that you will not be satisfied with my position with regard to this problem—not completely convinced and yet ready to be con vinced Perhaps you will say to your elves Here is another example of a person who has all his life been a steady going man of science and is now in his old age becoming weak mind ed religious and credulous I know that some great names belong in that category but you mus not reckon mine among them At least I have not grown religious and I hope I have not become credulous If one has humbled one

ser all o s lu long m order t avo d painful re ct w h f cts, one tends to keep one s hig bowed m c s o d sg before y new

terat But I am ot concerned to seek all mes f our and I must suggest to you that you ould think more kindly of the bjecti e possil y of thou t tran ference and there-f re also of telepathy

You must no forget that I have only dealt with the problem here in so fa as one can approach it from the direct on of psycho- nalys When I turned my thoughts towards more than ten years go I too f lt afraid lest o r scien c outlook might be end ngered and ha e to give wa t spiritualism r m tici m if oc cult p en mena were proved t be true I th k otherwise ow t eems t m that one is dis showing o great trust in science f o e c n t rely on it to ccept and deal with any occu t hypotheses th t ma turn out to be orrect A d as regards thought transference in part cular t would seem actually t f r the extension of t scientific (or as opponen s w uld sa mecham) way of thinking on to the lu e wo d of the mind. For the t lepathic process is supposed t consi t m a mental a t of one person gi m ri e t the same me t l ct i another What lies between th tw mental acts may very well be a physical process into which the mental process transforms t lf t one end and which is transf rmed back into the same mental proces t the h r The analogy with other tran f rmations uch as speakin and hearing cro s the t lephone is b ou o e A d think what t would mean f one could g t h ld of thi phys cal equ ale t of the mental act I ould lik t po t out that by in ert ing the uncon cious betw en th phys cal and what has hith rto been reg rded s th mental, psycho-analysi ha p epared the way f the acceptance of such processes s t lepathy If one gets used t the d f telepathy one can ccount f great deal by means of t f of ours only in imagination It is a f miliar f ct that we ha e n n tu f h w the c m munal will f the great insect states omes bout Pos bly t wo ks by mean f mental tra ferenc f this d r t kind One is led to conjecture that this m be th origin l a hai method by wh ch indi duals und rstood ea other and wh ch has been pushed into the background in th rse f phylogenetic d elopment by the better method of commun cation by means of gns ppre ended by the sen e organs But uch older methods may have pers ted in the background and ma still mani fest themsel es under cert in cond tions for example in crowds roused to a st te of passionate excitement. All of this is highly speculative and f ll of unsol ed problems but there is no need to be alarmed by it.

If telepa hy is a real process one may in sp te of the difficulty of proof suppose that it is quite a common phenomenon It would fit n w th our expectat ons f we could h w tha it occurs particularly in the mental l fe of chl dren. One s reminded of the freq ent fear fel by children that the r parents know ll th tho hts without ha ing been told them—a fear wh ch s a complete parallel to and perhaps the ori n of the beli f of adults in th om n cience f God A hort t me go a trust worth observer Dorothy Bu ham published ome findings n a pape cal ed Child Anal s and the Mother" wh ch if they are confirmed m st put a end to a v emain ng d ubts of the re l ty of thou ht tran fer c She took he t rt g po nt a number of those cases (ow no lo ger rare) i wh ch a mother and ch ld re being an l sed at the same tim d eported uch m kab e phenomena as th followi g O e day in her n lytic hou the m the wa talkin abo t a gold coin which had figu ed in e f her hildhood experiences Immed at l fterward when he had returned hom he l ttle ten year-old boy came into h r room and b ought her gold c in t keep f r

asked he to try to fi d out f m the child why h had beha ed in this way B the anal s of the child el cited th the ct on had mad ts way int the child life that day like a f re gn body A few weeks l ter the moth w tting at h writing t bl in o de to mak a n t of the occurrence s sh h d been a ked to d At that m ment the bo came in and a ked f th gold coin back, savin th t he wa ted t tak t t show his analys Once m the h ld s analysis disclosed n thing th t led up t the wi h

And with that we return to our starting point—th stud of psycho-anal s

LECTURE 31

THE ANATOMY OF THE MENTAL PERSONALITY

LADIES AND GENTLEMEN I am sure you all recognize in your dealings whether with per sons or things the importance of your starting point It was the same with psycho analysis the course of development through which it has passed and the reception which it has met with have not been unaffected by the fact that what it began working upon was the symptom a thing which is more foreign to the ego than anything else in the mind The symptom has its origin in the repressed it is as it were the representative of the repressed in relation to the ego the repressed is a foreign territory to the ego an internal foreign territory just as reality is—you must excuse the unusual expres sion—an external foreign territory From the symptom the path of psycho analysis led to the unconscious to the life of the instincts to sexuality and it was then that psycho analysis was met by illuminating criticisms to the effect that man is not merely a sexual being but has nobler and higher feelings It might have been added that supported by the consciousness of those higher feelings he often allowed himself the right to think nonsense and to overlook facts

You know better than that From the very beginning our view was that men fall ill owing to the conflict between the demands of their instincts and the internal resistance which is set up against them not for a moment did we forget this resisting rejecting and repressing factor which we believed to be furnished with its own special forces the ego instincts and which corresponds to the ego of popular psy chology The difficulty was that since the progress of all scientific work is necessarily la borious [illegible] part of [illegible] ment on [illegible] At last we had got so far that we could turn our atten tion from the repressed to the repressing forces and we came face to face with the ego which seemed to need so little explanation with the certain expectation that there too we should find things for which we could not have been prepared but it was not easy to find a first method of approach That is what I am going to talk to you about today

Before I start I may tell you that I have a suspicion that my account of the psychology of the ego will affect you differently than the introduction into the psychological underworld that preceded it Why that should be the case, I cannot say for certain My original explana tion was that you would feel that whereas hitherto I have been telling you in the main about facts however strange and odd they might appear this time you would be listening chiefly to theories that is to say speculations But that is not quite true when I weighed the matter more carefully I was obliged to con clude that the part played by intellectual manipulation of the facts is not much greater in our ego psychology than it was in the psy chology of the neuroses Other explanations turned out to be equally untenable and I now think that the character of the material itself is responsible and the fact that we are not accustomed to dealing with it Anyhow I shall not be surprised if you are more hesitant and careful in your judgment than you have been hitherto

The situation in which we find ourselves at the beginning of our investigation will itself suggest the path we have to follow We wish to make the ego the object of our study our own ego But how can we do that? The ego is the subject *par excellence* how can it become the object? There is no doubt however that it can The ego can take itself as object it can treat itself like any other object observe itself criticize itself and do Heaven knows what besides with itself In such a case one part of the ego stands over against the other The ego can then be split it splits when it performs many of its functions at least for the time be ing The parts can afterwards join up again After all that is saying nothing new perhaps it is only underlining more than usual some thing that every one knows already But on the other hand we are familiar with the view that pathology with its magnification and ex aggeration can make us aware of normal phe nomena which we should otherwise have missed Where pathology displays a breach or a cleft under normal conditions there may well be a link If we throw a crystal to the ground it breaks but it does not break haphazard in ac cordance with the lines of cleavage it falls into fragments whose limits were already deter mined by the structure of the crystal although they were invisible Psychotics are fissured and splintered structures such as these We cannot deny them a measure of that awe with which madmen were regarded by the peoples of an cient times They have turned away from ex ternal reality but for that very reason they know more of internal psychic reality and can

t.. is much tha would otherwise be inacces- s... to us One group of them su er wha we n.. delusion of observation. They complain t..t they suffer continually and in their ...st ... mina ... ction from the observation of unknown powers o persons and they have hal... ...ons in which they hear these persons reporting the results of their bservations "Now he is going to say this now he is dress- ... himself to go out, and so on. Such observa ... is not the same thing as persecution but ... is not far removed from it. It implies that these persons distrust the patient and expect to catch him doing something that is forbidden and for which he will be punished How would it be if these mad peopl were right, if w all of us had an bserving function in our egos threatening us with punishment, which in their case ... merely become sharpl separated from ... ego and had been mistakenly projected into external reality

I d t know whether it will ppeal to you in the same way as it appeals to m Under the strong impression of this linical p cture, I formed the idea that the eparating ff f an observing function from the rest f th ego might be ormal feature f the ego ructure this idea has ever l ft me and I was driven to investigate the f rth characteristics and re- ... of the function which had been separated ... this wa The ext tep is soon taken. The actual content f th delusion f bs rva tion makes i probabl that th bservat on is only a first tep t wards con ... and punish- ment, so that w ma guess that an ther a ... of this function must be what w call conscience. There is hardly an thin that we separat ff from our ego so regula ly as our conscience and so easily set ove ainst t I feel temptation t do something which prom ises t bring m pleasure but I refrain from doing it on the ground that *my onscienc will not allow* *i* Or I allow myself t be persuaded by the greatness of th expect tion of pleasure ... doing ... against which the oice f my conscience ha pro ested and after I have don t my conscience punishes m with painful reproaches, and makes m feel rem rs for t I must s... ly say that th function which I am beginning to distinguish within the ego is th conscience but t is m re prudent to keep that function as separa entity and assum that conscience is one of ts activities and that the self-observation which is ecessary as pre- liminary t the judicial aspect of con...cien is another And since the process of recognizing a thi... as a eparate entity involves giving it a name of ... own I will henceforward call this function in the e...o the *su er-ego*

At this point I am qu te prepared for you to a..k cornfull whether our ego-psychology amounts to no more than takin everyda ab- stract ons l terall magnif ... them, and turn- ing them from concepts into things—which w uld not be of much a ... tance M answer to that is that in ego-psychology it will be d f ficult to a oid what is alread familiar and that i is more a quest on of arri ... ing at new wa s of looking t things and new groupings of the facts than of makin new disco eries I will n t a...k you therefore to abandon our critical attitude but merely to await further developments The facts of path lo... g... e our efforts a background f r which you will look in vain in popular psycholog I will proceed No sooner ha e we got used to the idea of this super-ego as som thing which enjo s a certain independen e pursues its own ends and is ind pendent of the ego as regards the energy at its disposal than we are faced with a clin cal p cture which throws into stron relief the severity a d even cru l ... of this function a d th vicissitudes through which its relations with th ego may pa...s I refer to the condition of m l... cho ia o more a curat l the m lan ch lic attack, f which you must ha e heard ofte enough even if you are not psychiatrists. In this d ea... about whose causes and mecha n...m we know far too li tle the mo t remark ab characteristic is the wa in which the super-ego— ou ma call t b...t in a whisper th *conscience*—tre ts the ego The melancho- liac during period of heal h can like any one lse be m re o less severe towards himself but when he has m lancholic ttack, his ...pe -ego becomes er e re abuses humili

though it had spent the whole interval in amass ing omplaints and was only waiting for t present increase in trength t bring them f rward, and t co demn th ego on their c count. Th supe -ego has the e t its mercy

between th ego and th super-ego It is a ery remarkable experience to bserve morality which was osten...ibly onf rred on us by God

and planted deep in our hearts functioning as a periodical phenomenon For after a certain number of months the whole moral fuss is at an end the critical voice of the super ego is silent the ego is reinstated and enjoys once more all the rights of man until the next attack Indeed in many forms of the malady something exactly the reverse takes place during the intervals the ego finds itself in an ecstatic state of exaltation it triumphs as though the super ego had lost all its power or had become merged with the ego and this liberated maniac ego gives itself up in a really uninhibited fashion to the satisfaction of all its desires Happenings rich in unsolved riddles!

You will expect me to do more than give a mere example in support of my statement that we have learnt a great deal about the formation of the super ego that is of the origin of conscience The philosopher Kant once declared that nothing proved to him the greatness of God more convincingly than the starry heavens and the moral conscience within us The stars are unquestionably superb but where conscience is concerned God has been guilty of an uneven and careless piece of work for a great many men have only a limited share of it or scarcely enough to be worth mentioning This does not mean however that we are overlooking the fragment of psychological truth which is contained in the assertion that conscience is of divine origin! but the assertion needs interpretation Conscience is no doubt something within us but it has not been there from the beginning In this sense it is the opposite of sexuality which is certainly present from the very beginning of life and is not a thing that only comes in later But small children are notoriously amoral They have no internal inhibitions against their pleasure seeking impulses The role which the super ego undertakes later in life is at first played by an external power by parental authority The influence of the parents dominates the child by granting proofs of affection and by threats of punishment which to the child mean loss of love and which must also be feared on their own account This objective anxiety is the forerunner of the later moral anxiety so long as the former is dominant one need not speak of super ego or of conscience It is only later that the secondary situation arises which we are far too ready to regard as the normal state of affairs the external restrictions are introjected so that the super ego takes the place of the parental function and thenceforward observes guides and threatens the ego in just the same way as the parents acted to the child before

The super ego which in this way has taken over the power the aims and even the methods of the parental function is however not merely the legatee of parental authority it is actually the heir of its body It proceeds directly from it and we shall soon learn in what way this comes about First however we must pause to consider a point in which they differ The super ego seems to have made a one sided selection and to have chosen only the harshness and severity of the parents their preventive and punitive functions while their loving care is not taken up and continued by it If the parents have really ruled with a rod of iron we can easily understand the child developing a severe super ego but contrary to our expectations experience shows that the super ego may reflect the same relentless harshness even when the up bringing has been gentle and kind and avoided threats and punishment as far as possible We shall return to this contradiction later when we are dealing with the transmutation of instincts in the formation of the super ego

I cannot tell you as much as I could wish about the change from the parental function to the super ego partly because that process is so complicated that a description of it does not fit into the framework of a set of introductory lectures such as these and partly because we ourselves do not feel that we have fully understood it You will have to be satisfied therefore with the following indications The basis of the process is what we call an *identification* that is to say that one ego becomes like another one which results in the first ego behaving itself in certain respects in the same way as the second it imitates it and as it were takes it into itself This identification has been not inappropriately compared with the oral cannibalistic incorporation of another person Identification is a very important kind of relationship with another person probably the most primitive and is not to be confused with object choice One can express the difference between them in this way when a boy identifies himself with his father he wants to *be like* his father when he makes him the object of his choice he wants to *have* him to possess him in the first case his ego is altered on the model of his father in the second case that is not necessary Identification and object choice are broadly speaking independent of each other but one can identify oneself with a person and

ter o s ego accordingl a d take the same person as one s sexual object. It is said that this altering of the ego by the sexual obj ct takes place ry often with women a d is characteristic of femininity With regard to wh is by fa th most instructi e relation between identificat on and object-cho ce I must have given you me informat o in my previ

d
lf
p

tern m d on s eg so that in this case obj ect-cho ce regres es as it were to identifi ca on.

I m myself not at all satisfied with this a count of ident fication b t t will suffice f you ll grant that the establi hm nt of the

a super- r funct on within the ego is extremely closel bound up with the f te of the Oedipus complex, so that the super-eg ppears s the h of that emotional tie which is of such importance f r childhood When th Oedipus comp passes away th hild mu t gi e up t eir ense object c thexes wh h t ha formed tow rds ts pa ent a d to compe sate fo this loss of bject its dentific tion with its pa ents wh h ha probabl lon been present becom reatl inten ified. Identificat ons of th kind, which may be loo ed on s precip t tes of abando ed ob t cathexes will ecur ten eno h in th later lif f the child but it is in keeping with th em t onal importance f this first insta ce of such tran f rmation th t t prod ct hould occupy spec al po t on in the e Further in estigation also reveals that th uper-ego does n ttain t full st engt a development f the o er omn, f th Oedi pus c mp ex ha been compl t l s cces ful. During the course f t gr wth th uper-ego also takes over th influence of th se persons w ha ta en t place of the pa ents that is to f persons wh ha been on rned in the child's upbringing and whom it ha regarded s eal mod l A rmall th super-e is con tan ly becoming m e and m re rem t from t ginal pa ents, becoming as t were more imper nal An ther thin that w m t n t f rget is that th child alues ts parent dif ferentl t different periods of ts li At th tim at which th Oedipus omplex makes way for the super-ego they eem to be plendid figures but later on they lose a good deal of th r p esti e Identifications take place w th these lat r ed tions of the parents as well and regula ly pro ide important contribut ons to the format on of character but these only af fect the ego they have no influence on the super-ego which has been determined by the earliest parental imagos

I hope ou will by now feel that in pos ul tin the ex tence of a uper-ego I have been de cribin a genuine tructural entit a d have no been merel personif ing an abstract on u h as cons ence We have now to mention anoth r important act ty which i to be as cr bed to the super ego It is also the eh cle of *the ego- deal*, by which the ego measures itself t wards wh ch it str es and whose demands f r ever increasin perf ction i is alwa s tr ing t fulfil. No doubt this ego deal is a pre-cip t tion of the d dea f the parents an express on of the dmiration wh ch the child felt f r the perfect on wh ch it at that time ascribed t them I know you ha e heard a gre t deal abo t the en e of inferiority wh ch is said to d tinguish the neu otic ubject. It crops up especially in th pages of works that ha literary pretens ons A writer who brings in the xpres ion *inferiori y-com lex* thinks he has satisfied all the dema ds of psycho-anal s s and ra ed hi wo k o t a high r psycho ogi cal plane As a matt r f fact th phra e *in feriority-compl x* is hardly ever used in psycho-anal sis. It does not refer to anyth g wh ch w re ard as impl I t lone elementary To trace t back to th percept on in on e f of ome organic disab lity r o her s t chool of o-called Ind dual Psych ogi ts like to d seems to us a short s ghted error The en e of inferiority has stro erot ba The child feels se f inferio when it perce es tha t is not l ved, and o does the adult as w l. Th only organ th t s really rega ded as inf r r is the tur ed penis—th gi l s cl toris But th maj r part of the sense f inf riority springs from th relation hip f the ego to its uper-eg and like the en e of guilt t is an expres on of the t n on between them. Th sen e f in f n rity and th sense of gui are ex eedi ly difficult t di tinguish. P haps we hould d bet t f we regarded the former as t erot com plement to the ens of moral in eriority We ha paid but little attention to such questions of co ceptual di ere tia on in psycho-analysis.

Seeing th t th inf ri rity-compl x has be com so popula I shall venture to treat you to

and planted deep in our hearts functioning as a periodical phenomenon For after a certain number of months the whole moral fuss is at an end the critical voice of the super ego is silent the ego is reinstated and enjoys once more all the rights of man until the next attack Indeed in many forms of the malady something exactly the reverse takes place during the intervals the ego finds itself in an ecstatic state of exaltation [illegible] uelated maniac ego gives itself up in a really uninhibited fashion to the satisfaction of all its desires Happenings rich in unsolved riddles!

You will expect me to do more than give a mere example in support of my statement that we have learnt a great deal about the formation of the super ego that is of the origin of conscience The philosopher Kant once declared that nothing proved to him the greatness of God more convincingly than the starry heavens and the moral conscience within us The stars are unquestionably superb but where conscience is concerned God has been guilty of an uneven and careless piece of work for a great many men have only a limited share of it or scarcely enough to be worth mentioning This does not mean however that we are overlooking the fragment of psychological truth which is contained in the assertion that conscience is of divine origin! but the assertion needs interpretation Conscience is no doubt something within us but it has not been there from the beginning In this sense it is the opposite of sexuality which is certainly present from the very beginning of life and is not a thing that only comes in later But small children are notoriously amoral They have no internal inhibitions against their pleasure seeking impulses The role which the super ego undertakes later in life is at first played by an external power by parental authority The influence of the parents dominates the child by granting proofs of affection and by threats of punishment which to the child mean loss of love and which must also be feared on their own account This objective anxiety is the forerunner of the later moral anxiety so long as the former is dominant one need not speak of super ego or of conscience It is only later that the secondary situation arises which we are far too ready to regard as the normal state of affairs the external restrictions are introjected so that the super ego takes the place of the parental function and thenceforward observes guides and threatens the ego in just the same way as the parents acted to the child before

The super ego which in this way has taken over the power the aims and even the method of the parental function is however not merely the legatee of parental authority it is actually the heir of its body It proceeds directly from it and we shall soon learn in what way this comes about First however we must pause to consider a point in which they differ The super ego seems to have made a one sided selection and to have chosen only the harshness and severity of the parents their preventive and punitive functions while their loving care is not taken up and continued by it If the parents have really ruled with a rod of iron we can easily understand the child developing a severe super ego but contrary to our expectation experience shows that the super ego may reflect the same relentless harshness even when the up bringing has been gentle and kind and avoided threats and punishment as far as possible We shall return to this contradiction later when we are dealing with the transmutation of instincts in the formation of the super ego

I cannot tell you as much as I could wish about the change from the parental function to the super ego partly because that process is so complicated that a description of it does not fit into the framework of a set of introductory lectures such as these and partly because we ourselves do not feel that we have fully understood it You will have to be satisfied therefore with the following indications The basis of the process is what we call an *identification* that is to say that one ego becomes like another one which results in the first ego behaving *itself in certain respects in the same way* as the second it imitates it and as it were takes it into itself This identification has been not inappropriately compared with the oral cannibalistic incorporation of another person Identification is a very important kind of relationship with another person probably the most primitive and is not to be confused with object choice One can express the difference between them in this way when a boy identifies himself with his father he wants to *be like* his father when he makes him the object of his choice he wants to *have* him to possess him in the first case his ego is altered on the model of his father in the second case that is not necessary Identification and object choice are broadly speaking independent of each other but one can identify oneself with a person and

an old one. As so often happens it has taken a long time for its true value to be appreciated. As you are aware, the whole of psycho-analytic theory is in fact built up on the perception of the resistance exerted by the patient when we try to make him conscious of his unconscious. The objective indication of resistance is that his associations stop short or wander far away from the theme that is being discussed. He may also become subjectively aware of the resistance by experiencing painful feelings when he approaches the theme. But this last indication may be absent. In such a case we say to the patient that we conclude from his behaviour *that he is in a state of resistance, and he replies* that he knows nothing about it and is only aware of difficulty in associating. Experience shows that we were right, but, if so, his resistance too must have been unconscious, just as unconscious as the repressed material which we were trying to bring to the surface. Long ago we should have asked from which part of the mind such an unconscious resistance could operate. The beginner in psycho-analysis will be ready at once with the answer that it must be the resistance of the unconscious. An *ambiguous and useless answer! If it means that* the resistance operates from the repressed, then we must say: Certainly not! To the repressed we must rather ascribe a strong upward drive, an impulse to get through to consciousness. The resistance can only be a manifestation of the ego, which carried through the repression at one time or other and is now endeavouring to keep it up. And that, too, was our earlier view. Now that we have posited a special function within the ego to represent the demand for restriction and rejection, i.e. the super-ego, we can say that repression is the work of this super-ego—either that it does its work on its own account or else that the ego does it in obedience to its orders. If now we are faced with the case where the patient under analysis is not conscious of his resistance, then it must be that the super-ego and the ego can operate unconsciously in quite important situations, which would be far more significant that parts of both ego and super-ego themselves are *unconscious*. In both cases we should have to take account of the disturbing view that the ego (including the super-ego) does not by any means completely coincide with the conscious, nor the repressed with the unconscious.

Ladies and Gentlemen—I feel I must have a little breathing space, which I expect you will welcome with relief, and before I go on I must make an apology. Here am I giving you a supplement to the introduction to psycho-analysis which I started fifteen years ago, and I am behaving *as though you yourselves* had been doing nothing but psycho-analysis all that time. I know it is a monstrous supposition, but I am helpless. I have no alternative. The reason is that it is exceedingly difficult to give an *insight into psycho-analysis* to any one who is not himself a psycho-analyst. I assure you that we do not like to give the effect of being members of a secret society carrying on a secret science. And yet we have been obliged to recognize and state as our *considered opinion that no one has* a right to a say in psycho-analysis unless he has been through certain experiences which he can only have by being analysed himself. When I delivered my lectures to you fifteen years ago I tried to let you off certain speculative parts of our theory, but it is with those very parts that are connected the new discoveries which I am going to speak of to-day.

Now let me return to my theme. With regard to the two alternatives—that the ego and the super-ego may themselves be unconscious *or that they may merely give rise to unconscious* effects—we have for good reasons decided in favour of the former. Certainly large portions of the ego and super-ego can remain unconscious, *are in fact normally unconscious*. That means to say that the individual knows nothing of their contents and that it requires an expenditure of effort to make him conscious *of them. It is true then that ego and conscious*, repressed and unconscious do not coincide. We are forced fundamentally to revise our attitude towards the problem of conscious and unconscious. At first *we might be inclined* to think very much less of the importance of consciousness as a criterion, since it has proved so untrustworthy. But if we did so we should be wrong. It is the same with life: it is not worth much, but it is all that we have. Without the light shed by the quality of consciousness we should be lost in the darkness of depth psychology. Nevertheless we must try to orientate ourselves anew.

What is meant by *conscious* we need not discuss; *it is beyond all doubt*. The oldest and best meaning of the word *conscious* is the descriptive one; we call *unconscious* any mental process the existence of which we are obliged to assume—because, for instance, we infer it in some way from its effects—but of which we are not directly aware. We have the same re-

a short digression A historical personage of our own time who is still living but who for the present has retired into the background suffers from the mal development of a limb caused by an injury at birth A very well known contemporary writer who has a predilection for writing the biographies of famous persons has dealt with the life of the man to whom I am referring Now if one is writing a bio raphy it is naturally very difficult to suppress the urge for psychological understanding The author has therefore made an attempt to build up the whole development of his hero s character on the basis of a sense of inferiority which was caused by his physical defect While doing this he has overlooked a small but not unimportant fact It is usual for mothers to whom fate has given a sickly or otherwise defective child to try to compensate for this unfair handicap with an extra amount of love In the case we are speaking of the proud mother behaved quite differently she withdrew her love from the child on account of his disability When the child grew up into a man of great power he proved beyond all doubt by his behaviour that he had never forgiven his mother If you will bear in mind the importance of mother love for the mental life of the child you will be able to make the necessary corrections in the inferiority theory of the bio rapher

But let us get back to the super ego We have allocated to it the activities of self observation conscience and the holding up of ideals It follows from our account of its origin that it is based upon an overwhelmingly important biological fact no less than upon a momentous psychological fact namely the lengthy dependence of the human child on its parents and the Oedipus complex these two facts moreover are closely bound up with each other For us the super ego is the representative of all moral restrictions the advocate of the impulse towards perfection in short it is as much as we have been able to apprehend psychologically of what people call the hi her things in human life Since it itself can be traced back to the influence of parents teachers and so on we shall learn more of its significance if we turn our attention to these sources In general parents and similar authorities follow the dictates of their own super egos in the upbringin of children Whatever terms their ego may be on with their super ego in the education of the child they are [illegible]

fully at last with their own parents who in their day subjected them to such severe restraints The result is that the super ego of the child is not really built up on the model of the parents but on that of the parents super ego it take over the same content it becomes the vehicle of tradition and of all the age long values which have been handed down in this way from generation to generation You may easily guess what great help is afforded by the recognition of the super ego in understandin the social behaviour of man in gra ping the problem of delinquency for example and perhaps too in providing us with some practical hints upon education It is probable that the so called [illegible]

[illegible] re nothing more than resultants of their economic situation at any given moment or superstructures built upon it That is the truth but very probably it is not the whole truth Mankind never lives completely in the present the ideologies of the super-ego perpetuate the past the traditions of the race and the people which yield but slowly to the influence of the present and to new developments and so long as they work throu h the super ego play an important part in man s life quite independently of economic conditions

In 1921 I tried to apply the distinction between the ego and the super-e[illegible]

[illegible] uals who have introduced the same person into their super ego and on the basis of this common factor have identified themselves with one another in their ego This naturally only holds for groups who have a le der If we could find more applications of this kind the hypothesis of the super ego would lo e all its strangeness for us and we should be entirely relieved of the embarrassment which we cannot help feeling when used as we are to the atmosphere of the underworld we make excursions into the more superficial and higher planes of the mental apparatus Of course we do not for a moment think that the last word on ego psychology has been spoken with the demarcation of the super ego It is rather the beginning of the subject but in this case it is not only the first step that is difficult.

But now another task awaits us as it were at the opposite end of the ego This question is raised by an observation which is made during analytic work an ob ervation which is indeed

we ought not to deplore this fact but that we should say to ourselves that we had no right to expect any such neat arrangement. Let me give you an analogy; analogies prove nothing, that is quite true, but they can make one feel more at home. Let us picture a country with a great variety of geographical configurations, hills, plains, and chains of lakes, and with mixed nationalities living in it, Germans, Magyars and Slovaks, who moreover are engaged upon a number of different occupations. Now the distribution might be such that the Germans lived in the hills and kept cattle, the Magyars on the plains and grew corn and vines, while the Slovaks lived by the lakes and caught fish and plaited reeds. If this distribution were neat and exact it would no doubt give great satisfaction to a President Wilson; it would also be convenient for giving a geography lesson. It is probable, however, that you would find a less orderly state of affairs if you visited the region. Germans, Magyars and Slovaks would be living everywhere mixed up together, and there would be cornlands, too, in the hills, and cattle would be kept on the plains as well. One or two things would be as you expected, for one cannot catch fish on the mountains, and wine does not grow in water. The picture of the region which you had brought with you might on the whole fit the facts, but in details you would have to put up with departures from it.

You must not expect me to tell you much that is new about the id, except its name. It is the obscure inaccessible part of our personality; the little we know about it we have learnt from the study of dream-work and the formation of neurotic symptoms, and most of that is of a negative character, and can only be described as being all that the ego is not. We can come nearer to the id with images, and call it a chaos, a cauldron of seething excitement. We suppose that it is somewhere in direct contact with somatic processes, and takes over from them instinctual needs and gives them mental expression, but we cannot say in what substratum this contact is made. These instincts fill it with energy, but it has no organization and no unified will, only an impulsion to obtain satisfaction for the instinctual needs, in accordance with the pleasure-principle. The laws of logic—above all, the law of contradiction—do not hold for processes in the id. Contradictory impulses exist side by side without neutralizing each other or drawing apart; at most they combine in compromise formations under the overpowering economic pressure towards discharging their energy. There is nothing in the id which can be compared to negation, and we are astonished to find in it an exception to the philosophers' assertion that space and time are necessary forms of our mental acts. In the id there is nothing corresponding to the idea of time, no recognition of the passage of time, and (a thing which is very remarkable and awaits adequate attention in philosophic thought) no alteration of mental processes by the passage of time. Conative impulses which have never got beyond the id, and even impressions which have been pushed down into the id by repression, are virtually immortal and are preserved for whole decades as though they had only recently occurred. They can only be recognized as belonging to the past, deprived of their significance, and robbed of their charge of energy, after they have been made conscious by the work of analysis, and no small part of the therapeutic effect of analytic treatment rests upon this fact.

It is constantly being borne in upon me that we have made far too little use of our theory of *the indubitable fact that the repressed remains unaltered by the passage of time.* This seems to offer us the possibility of an approach to some really profound truths. But I myself have made no further progress here.

Naturally, the id knows no values, no good and evil, no morality. The economic, or, if you prefer, the quantitative factor, which is so closely bound up with the pleasure-principle, dominates all its processes. Instinctual cathexes seeking discharge—that, in our view, is all that the id contains. It seems, indeed, as if the energy of these instinctual impulses is in a different condition from that in which it is found in the other regions of the mind. It must be far more fluid and more capable of being discharged, for otherwise we should not have those displacements and condensations, which are so characteristic of the id and which are so completely independent of the qualities of what is cathected. (In the ego we should call it an *idea.*) What would one not give to understand these things better! You observe, in any case, that we can attribute to the id other characteristics than that of being unconscious, and you are aware of the possibility that parts of the ego and super-ego are unconscious without possessing the same primitive and irrational quality. As regards a characterization of the ego, in so far as it is to be distinguished from the id and the super-ego, we shall get on better if we turn our attention to the relation between

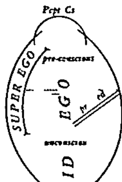
lation to that mental process as we have to a mental process in another person except that it belongs to ourselves If we want to be more accurate we should modify the statement by saying that we call a process *unconscious* when we have to assume that it was active *at a certain time* although *at that time* we knew nothing about it This restriction reminds us that most conscious processes are conscious only for a short period quite soon they become *latent* though they can easily become conscious again We could also say that they had become unconscious if we were certain that they were still something mental when they were in the latent condition So far we should have learnt nothing and not even have earned the right to introduce the notion of the unconscious into psychology But now we come across a new fact which we can already observe in the case of errors We find that in order to explain a slip of the tongue for instance we are obliged to assume that an intention to say some particular thing had formed itself in the mind of the person who made the slip We can infer it with certainty from the occurrence of the speech disturbance but it was not able to obtain expression it was that is to say unconscious If we subsequently bring the intention to the speaker s notice he may recognize it as a familiar one in which case it was only temporarily unconscious or he may repudiate it as foreign to him in which case it was permanently unconscious Such an observation as this justifies us in also regarding what we have called *latent* as something *unconscious* The consideration of these dynamic relations puts us in a position to distinguish two kind of unconscious one which is transformed into conscious material easily and under conditions which frequently arise and another in the case of which such a transformation is difficult can only come about with a considerable expenditure of energy or may never occur at all In order to avoid any ambiguity as to whether we are referring to the one or the other unconscious whether we are using the word in the descriptive or dynamic sense we make use of a legitimate and simple expedient We call the unconscious which is only latent and so can easily become conscious the *preconscious* and keep the name *unconscious* for the other We have now three terms *conscious preconscious* and *unconscious* to serve our purposes in describing mental phenomena Once again from a purely descriptive point of view the *preconscious* is also unconscious but we do not give it that name except when we are speaking loosely or when we have to defend in general the existence of unconscious processes in mental life

You will I hope grant that so far things are not so bad and that the scheme is a convenient one That is all very well unfortunately our psycho analytic work has compelled us to use the word *unconscious* in yet another third sense and this may very well have given rise to confusion Psycho analysis has impressed us very strongly with the new idea that large and important regions of the mind are normally removed from the knowledge of the ego so that the processes which occur in them must be recognized as unconscious in the true dynamic sense of the term We have consequently also attributed to the word *unconscious* a topographical or systematic meaning we have talked of *systems* of the preconscious and of the unconscious and of a conflict between the ego and the *Ucs* system so that the word *unconscious* has more and more been made to mean a mental province rather than a quality which mental things have At this point the discovery inconvenient at first sight that parts of the ego and super ego too are unconscious in the dynamic sense has a facilitating effect and enables us to remove a complication We evidently have no right to call that region of the mind which is neither ego or super ego the *Ucs* system since the character of unconsciousness is not exclusive to it Very well we will no longer use the word *unconscious* in the sense of a system and to what we have hitherto called by that name we will give a better one which will not give rise to misunderstandings Borrowing at G Groddeck s suggestion a term used by Nietzsche we will call it henceforward the *id* This impersonal pronoun seems particularly suited to express the essential character of this province of the mind—the character of being foreign to the ego Super ego ego and id then are the three realms regions or provinces into which we divide the mental apparatus of the individual and it is their mutual relations with which we shall be concerned in what follows

But before we go on I must make a short digression I have no doubt that you are dissatisfied with the fact that the three qualities of the mind in respect to consciousness and the three regions of the mental apparatus do not fall together into three harmonious pairs and that you feel that the clarity of our conclusions is consequently impaired My own view is that

mands are always di ergent and often seem quite incompatible no wo der that the ego so frequently gives wa und r its ta k. The three tyrants are the external wo ld the uper-ego and th id. When one w t hes the efforts of the ego to sati f them all or rathe to obey them all simultaneously o e cannot regret ha ing personified the ego and establi hed it a separate being It feels it elf hemmed in on three s des and threatened by three kinds of dange towards which it reacts by developing anxiety when t is too hard pressed. Ha ing originated m th experiences of th perceptual sy em t is designed to represent the demands o the external world but it als wi hes t be loyal servant of th id to remain upo good

id and ality t is often fo ced to clothe the Ucs commands of the d with it own Pcs rati n alizations to gl ss o er the onflicts between the id and real t and with diplomat c dis h est to displa pretended regard for reality even when the d pers ts in being stubborn and unc mpromising On th oth r hand, its every movement is w tched by the ev re super-ego which holds up certain n rms f be ha our witho t regard to any difficulties coming from the id a d th xternal w ld nd if these norms re ot acted up to it punishes the ego w th the feelings of tens o which manifest themsel es s a sens of infer rity and guilt. In this wa go ded on by th d hemmed in by th supe -ego and ebuffed by reality the ego truggles to cope with t econ mic ta k of redu ing the f es and in fluen es which w k in t and upo t to som kind f harm y and we ma w ll understand how t is that we o often cannot repres the cry Life is ot asy Wh th ego is forced to acknowledge ts weaknes it b eak out into anx t eality anxiety in f c of the t rnal d rmal anx ty in f f the super-ego and eurotic anxiety in f ce of th trength of the passions in the d



I ha e represented the structural relations within th mental personality as I ha ex plained them t yo in a simpl diagram which I here ep od c

You will bserve how the super-ego goes down int th d as the heir to the Oedipus c mplex t has lt r ll intimate conn tions w th th id It lies furth from the pe eptual system than the ego The d only de ls with th external w rld thro gh th medium of th ego

at lea t in this diagram It is certainly still too ea ly to y how far the drawing is correct in ne respect I know t i not. The space taken up by the unconscious id ought to be incomparably greater than that gi en to the ego or to the precon c ous You must if you please cor rect th t in your imagination

And now in co cl ding this certainly rather exhausting and perhaps not very illum natin k

just ce to the characteristics of the mind b means of line r co to rs uch as occur in a drawing o in a primitive painting but we need rather the areas of c l ur shading off into one an the that re to be found in mod rn p c tures After we ha e made our separations we must allow what we ha e separated to merge again Do not jud e too harshly of a first at t mpt at p cturing a thing so elusi e as the human mind It is ery probable that the extent of these diff rentiations varies very greatly f om person to pers it s possible that the r functi itself may vary and that they may at times und rgo a process of involution This seems to be part cularly true of the most in ecure and, from the ph loge tic point of ew th mo t recent of them, the diff rentiat on between the go and the supe ego It is also

incontestable that th sam thi g can come bout as result of m ntal di ease It can easily be imagined too that c rtain practices of mystics may succeed in upsetting the normal relation between th diff rent regions of the mind s that f r example th pe ceptual sys tem becomes abl t gra p relati ns in the deepe la ers f the ego and in th d which would oth rwis be ina cess ble t t. Whether

it and the most superficial portion of the men tal apparatus which we call the *Pcpt Cs* (perceptual conscious) system This system is directed on to the external world it mediates perceptions of it and in it is generated while it is functioning the phenomenon of conscious ne s It is the sense organ of the whole [illegible]

[illegible] can hardly go wrong in regarding the ego as that part of the id which has been modified by its proximity to the external world and the influence that the latter has had on it and which serves the purpose of receiving stimuli and protecting the organism from them like the cortical layer with which a particle of living substance sur rounds itself This relation to the external world is decisive for the ego The ego has taken over the task of representin the external world for the id and so of saving it for the id blindly striving to gratify its instincts in compl[illegible]

[illegible] ego has to ob serve the external world and preserve a true picture of it in the memory traces left by its perceptions and by means of the reality test it has to eliminate any element in this picture of the external world which is a contribution from internal sources of excitation On behalf of the id the ego controls the path of access to motility but it interpolates between desire and action the procrastinating factor of thou ht during which it makes use of the residues of experience stored up in memory In this way it dethrones the pleasure principle which exerts undisputed sway over the processes in the id and substitutes for it the reality principle which promises greater security and greater success

The relation to time too which is so hard to describe is communicated to the ego by the perceptual system indeed it can hardly be doubted that the mode in which this system works is the source of the idea of time What however especially marks the ego out in con tra distinction to the id is a tendency to synthesize its contents to bring to ether and unify its mental processes which is entirely absent from the id When we come to deal presently with the instincts in mental life I hope we shall succeed in tracing this funda mental characteristic of the ego to its source It is this alone that produces that high degree of organization which the ego needs for its highe[illegible] the cont[illegible] throu[illegible] stinct becom[illegible] ization and [illegible] unity In popular language we may say that the ego stands for reason and circumspection while the id stands for the untamed passions

So far we have allowed ourselves to dwell on the enumeration of the merits and capabilities of the ego it is time now to look at the other side of the picture The ego is after all only a part of the id a part purposively modified by its proximity to the dangers of reality From a dynamic point of view it is weak it borrows its energy from the id and we are not entirely ignorant of the methods—one might almost call them tricks —by means of which it draws further amounts of energy from the id Such a method for example is the process of identi fication whether the object is retained or given up The object cathexes proceed from the in stinctual demands of the id The first business of the ego is to take note of them But by identifying itself with the object it recom mends itself to the id in the place of the object and seeks to attract the libido of the id on to itself We have already een that, in the course of a person s life the ego takes into itself a large number of such precipitates of former object cathexes On the whole the e o has to carry out the intentions of the id it fulfils its duty if it succeeds in creating the conditions under which these intentions can best be ful filled One might compare the relation of the ego to the id with that between a rider and his horse The horse provides the locomotive energy and the rider has the prerogative of determining the goal and of guiding the move ments of his powerful mount towards it But all too often in the relations between the ego and the id we find a picture of the less ideal situation in which the rider is obliged to guide hi horse in the direction in which it itself wants to go

The ego has separated itself off from one part of the id by means of repression resist ances But the barrier of repression does not extend into the id so that the repressed mate rial merges into the rest of the id

The proverb tells us that one cannot serve two masters at once The poor ego has a still harder time of it it has to serve three harsh masters and has to do its best to reconcile the claims and demands of all three These de

me. I even thought it was justifiable to say that this unsatisfied libido is directly transformed into anxiety. This view found some support in certain almost universal phobias of small children. Many of these phobias are altogether enigmatic, but others such as the fear of being left alone and the fear of unfamiliar people can be definitely explained. Being left alone or seeing strange faces stirs up the child's longing for the familiar presence of its mother; it cannot control this libidinal excitation, it cannot keep it in a state of suspension, but turns it into anxiety. This anxiety in children, therefore, is not objective anxiety but must be classed among the neurotic anxieties. Children's phobias and the anxious expectation in anxiety-neurosis, serve as two examples of one way in which neurotic anxiety comes about, i.e., through direct transformation of libido. In a moment we shall learn of a second method, and we shall see that it is not so very different from the first.

For it is to the process of repression that we attribute the appearance of anxiety in hysteria and other neuroses. We now believe that it is possible to give a fuller description of this process than before if we separate the history of the idea that has to be repressed from that of the libido which is attached to it. It is the idea that undergoes repression and may be distorted so as to become unrecognizable; its associated affect is always turned into anxiety, regardless of its nature, whether that is to say it is aggression or love. Now it makes no essential difference on what grounds a given quantity of libido has become unusable, whether on account of the infantile weakness of the ego as in the case of children's phobias, or on account of somatic processes in sexual life, as in the case of anxiety neuroses, or on account of repression, as in the case of hysteria. The two mechanisms which give rise to neurotic anxiety are therefore essentially the same.

While we were engaged in these investigations we noticed a very important connection between anxiety-development and symptom formation. It was that the two are interchangeable. The agoraphobic, for example, begins his illness with an attack of anxiety in the street. This is repeated every time he walks along the street again. He now develops a symptom—a street phobia—which can also be described as an inhibition or functional restriction of the ego, and thus he preserves himself from anxiety attacks. One can observe the reverse process if one interferes with the formation of symptoms, as is possible, for instance, in the case of obsessive acts. If one prevents a patient from carrying out his washing ceremonial he is thrown into an intolerable state of anxiety, against which his symptom has obviously protected him. And indeed it seems as though anxiety-development is the earlier and symptom formation the later of the two, as though the symptom were created in order to prevent the outbreak of a state of anxiety. And it is in keeping with this that the first neuroses of childhood are phobias—conditions that is to say in which one sees quite clearly how what began as anxiety-development is later replaced by symptom formation; one gets an impression that this circumstance affords the best starting point from which to approach an understanding of neurotic anxiety. At the same time, we succeeded in discovering the answer to the question of what it is that one fears in neurotic anxiety, and thus restoring the connection between neurotic anxiety and objective anxiety. What one fears is obviously one's own libido. The difference between this and objective anxiety lies in two points—that the danger is an internal instead of an external one and that it is not consciously recognized.

In the case of phobias one can see clearly how this internal danger is transformed into

very complicated, and suppose that the agoraphobic is always afraid of his impulses in connection with temptations aroused in him by meeting people in the street. In his phobia he makes a displacement, and is now afraid of an external situation. What he gains thereby is obvious; it is that he feels he can protect himself better in that way. One can rescue oneself from an external danger by flight, whereas to attempt to fly from an internal danger is a difficult undertaking.

At the end of my original lecture on anxiety I expressed the opinion that though these various results of our investigations did not actually contradict one another they were nevertheless not entirely consistent. As an affective condition anxiety is the reproduction of an old danger-situation; even anxiety serves the purposes of self-preservation as being a signal of the presence of a new danger; it arises from libido that has become unusable for some reason or other including the process of repression; it is replaced by symptom formation and is thus, as it were, psychically

such a procedure can put one in possession of ultimate truths from which all good will flow may be safely doubted All the same we must admit that the therapeutic efforts of psycho analysis have chosen much the same method of approach For their object is to stren then the ego to make it more independent of the super e o to widen its field of vision and so to extend its organization that it can tal e over new portions of the id Where id was there shall ego be

It is reclamation work like the drainin of the Zuyder Zee

LECTURE 32

ANXIETY AND INSTINCTUAL LIFE

LADIES AND GENTLEMEN You will not be sur prised to hear that I have a great deal of new information to give you about our hypotheses on the subject of anxiety and the fundamental instincts of the mind and also that none of this information claims to provide a final solu tion of these doubtful problems I speak pur po ely of *hypotheses* This is the most difficult ta k that has been set us but the difficulty does not lie in the incompleteness of our obser vations for it is actually the commone t and mo t familiar phenomena that present us with such riddles nor does it lie in the remoteness of the speculations to which these phenomena give rise for peculation hardly comes into the picture in this connection No it is genuinely a que tion of hypotheses that is to say of the introduction of the ri ht abstract idea and of their application to the raw material of ob servation so as to bring order and lucidity into it

I devoted one lecture in my former series—the twenty fifth—to the study of anxiety I must recapitulate its contents in brief We said then that anxiety is an affective condition—that is to say a combination of certain feelings of the pleasure pain series with their corre ponding efferent innervations and a perception of them—but we asserted that anxiety i prob ably also the trace of a certain important event taken over by inheritance and therefore com parable to the ontogenetically acquired hyster ical attack We suggested that the event which left this affective trace behind it was the process of birth in which the modifications of the he rt s action and of respiration which are characteristic of anxiety served a u eful pur po e The first anxiety of all would thus have been a toxic one We then started from the distinction between objective anxiety and neu rotic anxiety the former being what seems to us an intelligible reaction to danger—that is to anticipated injury from without—and the latter altogether puzzlin and as it were pur poseless In our analysis of objective anxiety we explained it as a condition of increased sensory attention and motor tension which we c lled *anxiety preparedness* Out of this the anxiety reaction arises Th anxiety reaction may run one of two courses Either the *anxiety development* the repetition of the old traumatic experience is restricted to a signal in which ca e the rest of the reaction can adapt itself to the new situation of danger whether by flight or defence or the old experience gets the upper hand and the whole reaction ex hausts itself in anxiety development in which case the affective state is paralyzing and un adapted to the present situation

We then turned our attention to neurotic anxiety and pointed out that it could be ob served in three forms Firstly we have free floating general apprehensiveness ready to attach itself for the time being to any new po sibility that may arise in the form of what we call *expectant dread* as happens for in stance in the typical anxiety neurosis Second ly we find it firmly attached to certain ideas in what are known as *phobias* in which we can still recognize a connection with external dan ger but cannot help regarding the anxiety felt towards it as enormously exaggerated Thirdly and finally we have anxiety as it occurs in [illegible] and in other severe neuroses *this* [illegible] mani [illegible] ttack or as a [illegible] time but always without having any visible ju tifi cation in an external dan er We then a ked ourselves two questions What are people afraid of when they have neurotic anxiety? and How can one bring this kind of anxiety into line with objective anxiety felt towards an external danger?

Our investigations were by no means unsuc cessful and we succeeded in reaching a few important conclusions With regard to anxious expectation clinical experience has tau ht us that there is a regular relationship between it and the di position of the libido in the exual life The most frequent cau e of anxiety neu rosis is undi charged excitation A libidinal excitation is arou ed but is not atisfied or used in the place of th s libido which has been diverted from its use anxiety makes its appear

lized fear of the loss of love obviously a continuation of the fear of the infant at the breast when it misses its mother. You will understand what objective danger-situation is indicated by this kind of anxiety. If the mother is absent or has withdrawn her love from the child it can no longer be certain that its needs will be satisfied, and may be exposed to the most painful feelings of tension. There is no need to reject the idea that these conditions for anxiety fundamentally repeat the situation of the original birth-anxiety which had to be understood as implied separation from the mother. In deed, if you follow a line of thought suggested by Ferenczi, you may add fear of castration too to this series, for the loss of the male genital organ results in the impossibility of a reunion with the mother or with a substitute for her in the sexual act. I might mention, incidentally, that the common phantasy of returning to the womb is a substitute for this desire for coitus. There are still a great number of interesting and surprising facts which I must tell you about in this connection but I must not step beyond the bounds of an introduction to psycho-analysis. I will, therefore, merely draw your attention to the way in which, at this point, the findings of psychology take us to the frontiers of biological fact.

Otto Rank, to whom psycho-analysis owes many valuable contributions, has also the merit of having strongly emphasized the importance of the act of birth and of separation from the mother. It is true that the rest of us found it impossible to accept the extreme deductions that he drew from this factor with regard to the theory of the neuroses and even to analytical therapy. But before this he had already discovered the central feature of his doctrine, namely that the anxiety-experience of birth is the prototype of all later danger-situations. If we pause for a moment at this point we can say that, as a matter of fact, every stage of development has its own particular conditions for anxiety, that is to say danger-situation appropriate to it. The danger of mental helplessness corresponds to the stage of early immaturity of the ego, the danger of loss of object or of love corresponds to the dependence of the early years of childhood, the danger of castration to the phallic phase and finally the fear of the super-ego which occupies a special position, to the period of latency. As development proceeds the old conditions for anxiety should vanish, since the danger-situations which correspond to them, have lost their force owing to the strengthening of the ego. But this only happens to a very incomplete degree. A great many people cannot overcome the fear of loss of love; they never become independent enough of the love of other people and continue their infantile behaviour in this respect. The fear of the super-ego should normally never cease, since it is indispensable in social relations in the form of moral anxiety, and it is only in the rarest instances that an individual succeeds in becoming independent of the community. A few of the old danger-situations also manage to preserve their force in later life by bringing their conditions for anxiety up-to-date form. Thus for instance the danger of castration is preserved under the disguise of syphilidophobia. Grown-up people are well aware that castration is no longer practised as a punishment for indulging sexual desires, but, on the other hand, they have learned from experience that instinctual freedom in this direction involves the risk of severe illnesses. There is no doubt that persons whom we call *neurotic* remain infantile in their attitude towards danger and have not grown out of antiquated conditions for anxiety. Let us accept this as a factual contribution to our characterization of neurotics; why it should be so is not so easy to say.

I hope you have not lost the thread of our discourse and that you remember that we are discussing the relations between anxiety and repression. We have discovered two new facts in doing so: first, that anxiety causes repression and not the other way round as we used to think, and secondly, that frightening *instinctual* situations can in the last resort be traced back to *external* situations of danger. Our next question will be: How can we picture the process of repression carried out under the influence of anxiety? I think this is what happens: the ego becomes aware that the satisfaction of some nascent instinctual demand would evoke one among the well-remembered danger-situations. This instinctual cathexis must, therefore, somehow or other be suppressed, removed, made powerless. We know that the ego succeeds in this task if it is strong and if it has assimilated the impulse in question into its organization. In the case of repression however the impulse is still a part of the id and the ego feels weak. In such a contingency the ego calls to its aid a technique which is, at bottom, identical with that of normal thinking. Thinking is an experimental dealing with small quantities of energy, just as a general moves miniature

bound in all of this one feels that something is missing which would combine these fragments into a unity

Ladies and Gentlemen—The division of the mental personality into a super ego ego and id which I spoke about in the last lecture has forced us to take up a new position with regard to the problem of anxiety In assuming that the ego is the only seat of anxiety and that only the ego can produce and feel anxiety we have taken up a new and secure position from which many facts take on a new aspect And when you come to think of it it is difficult to see what sense there could be in speaking of an *anxiety of the id* or how we could ascribe a capacity for feeling anxiety to the super ego On the contrary we have found a satisfactory confirmation of our theory in the fact that the three main varieties of anxiety—objective anxiety neurotic anxiety and moral anxiety—can so easily be related to the three directions in which the ego is dependent on the external world on the id and on the super-ego Our new position too has brought to the fore the function of anxiety as a signal indicating the presence of a dan er situation a function with which we were already not unfamiliar The question of the stuff out of which anxiety is made loses interest for us and the relations between objective anxiety and neurotic anxiety are clarified and simplified in a surprising way And besides this it is to be noticed that we now understand the apparently complicated cases of anxiety formation better than we do those which seem to be simple

We have recently investigated the manner in which anxiety comes about in certain phobias which we class with anxiety hysteria and we have chosen for investigation cases in which we have to deal with the typical repression of desires proceeding from the Oedipus complex We should have expected to find that it is the libidinal cathexis of the mother as object which as a result of repression is transformed into anxiety and now manifests itself in the form of a symptom as attached to the father substitute I cannot tell you all the individual steps of an investigation of this kind let it suffice to say that to our astonishment the result was the reverse of what we had expected It is not the repression that creates the anxiety but the anxiety is there first and creates the repression! But what sort of anxiety can it be? It can only be fear of a threatening external danger that is to say objective anxiety It is true that the boy is afraid of the demands of his libido in this case of his love for his mother o that this is really an instance of neurotic anxiety But this being in love seems to him to be an internal danger which he must avoid by renouncing his object only because it involves an external danger situation And in every case we have investigated we have obtained the same result It must however be confessed that we were not prepared to find that the instinctual danger was only a half way house to an external and real danger situation

We have however not yet said what the real danger is that the child fears as a result of his being in love with his mother It is the punishment of castration the loss of his penis Naturally you will object that after all that is not a real danger Our boys are not castrated because they are in love with their mothers during the phase of the Oedipus complex But the question cannot be so easily dismissed It is not primarily a matter of whether castration is really performed what is important is that the danger is one that threatens from without and that the boy believes in it He has some grounds for doing so for not infrequently threats of his penis being cut off are made during his phallic phase at the time of his early masturbation and no doubt allusions to such a punishment will always find a phylo en etic reinforcement on his side We have conjectured that in the early days of the human family castration really was performed on the growing boy by the jealous and cruel father and that circumcision which is so frequently an element in puberty rites is an easily recognizable trace of it We are aware of how far removed we are from the common point of view in saying this but we must maintain our position that fear of castration is one of the most frequent and one of the strongest motive forces of repression and therefore of the formation of neuroses The analysis of cases in which it is true not castration itself but circumcision has been performed on boys as a cure or as a punishment for masturbation (a thing which was by no means of rare occurrence in English and American society) has provided us with conclusive proof that we are right It is a great temptation at this juncture to go further into the castration complex but we will keep to our subject Fear of castration is naturally not the only motive for repression to start with it has no place in the psychology of women they have of course a castration complex but they cannot have any fear of castration In its place for the other sex is

tend ear of the loss of lov obv ousl a re n on of th fea of the infant at the best when m ses ts mother You will nderstand what ob ectre danger-situation is eated by this kind of anxiety If the m her has absent or has withdrawn h r love from the d it can no longer be certain that s need will b s ed, and may be exposed to the most painful feelings of t n n. There is no need to reject the dea that th se o ditions for anxiety fundamentally repeat the tuat on of the original birth-anxi ty wh ch to be ure, it also implied separa on from the mothe In deed, if you follow a line of thou t uggested by Ferenczi, you ma add fea of castration too to this series for the loss of the male genital organ results in th impos bilit of a reunion with th mother r w th a ubstitute fr er m the sexual ct. I might ment on incidentally that the common phantasy of re- turning m th womb is subsitu e fo this desire fo co us Th re are till a great number of interesting and surpri in facts which I might tell you bout in this connect o but I must no step beyond the bounds of an intro- duction to psycho-anal sis. I will therefore, merely draw your ttention to the way in which, t this point the findings of psy h logy take us t the frontiers of b ological fact.

O o Rank, to whom psycho-analys s owes many valuabl contributions has also the merit of having strongly emphasized th importance o t ct of birth and f eparation from the mother It is true that th rest of us f und t impossible to a cept th extrem deducti ns t h drew from this f cto with regard t the theory f th euroses and even t analyti cal therapy But before this he had already discovered the central featur f hi doctrin nam ly that the anxiet -experienc of b rth is the pro ype f all later dang situati n If we pause for a momen t this point w can say that as ma ter f f ct every t ge f deve opment has t own particula condit on for anxiety that is to y dan er tuati n appropriate t The da ger of mental help- lessness c rresponds t th st ge f ea ly im maturity of th e the danger f loss f object or of love correspo ds t th dependence f the early years f childhood th da er f castration t th phallic phase and finally the fear f the super-ego which occup es special position t the period of l tency As devel p- ment proceeds the old condition for anxi ty should vanish since th d n tuat ons which correspond t them, have l st th ir f rce owin to the trengthening of the ego But this only happens to a very incomplete degree A great man people cannot o ercome the fe r of loss of lo e they never become independent enou h of the lo e of other people and con t nue th ir infantile beha iour in this respect. The fear of the super-ego hould normall never cease since t is indispen ab e in ocial relat ns in the form of moral anxiet and it is onl in the rarest in tances that an indi idual ucceeds in becoming ndependent of the com munity A few of the old danger ituat ons also manage to preserve their force in later life by ch nging the r co ditions for anxiety in up- o- date form. Thus for instance the danger of ca trat on is preserved under the disguise of syphilid phobia Grown up peop e are well aware that ca tration is no longer practi ed s a pun ment for ind lging sexual des res but, on the other hand, they ha e learned from ex perience that instinctual freedom in this direc tion m l es th n k of sever llnesses There is n doubt that persons wh m we call *neurotic* remain inf ntil in th ir ttitude towards dan g r d ha no grown out of an iquated conditions fo anxie y Let us accept this as a factual contribution to our charact rizat on of neurotics why it should be so is not so easy to say

I hope ou ha e not lost the thread of our discours and that you remember that we r di cussin th rel t ons between anxi ty and rep es i n. We ha e discovered two new facts in doing o first that anxiety causes repre on and not the ther way round as we used to th nk a d ec ndly that fri htening *instinc* tuation can in th last res rt be traced back to *e ternal* situations of danger Ou next quest o will be H w can we p cture th proc ess f repress on carried out under the influence f anxi t ? I think this is what happens the ego becomes aware that the sa fa tion of om na cent in tinctual demand wou d evoke one among th well remembered dange -situa ti ns This instinctual cathexis must, theref re som how the be up es ed, removed, m de powerless We kn w that th ego succeeds in this ta k f i is tro g d if it has a im ilated the impulse in question int its organi zation In th ase f repres on howev r the impulse is still a part of the id and th ego feels weak. In ch contingency the ego calls t ts d techniqu wh h is at bottom, dentical with that f ormal thinkin Thinking an experimental dealing with mall quantities of energy ju t as gen ral moves miniature

figures about over a map before setting his troops in motion In this way the ego anticipates the satisfaction of the questionable impulse and enables it to reproduce the painful feelings which are attached to the beginning of the dreaded danger situation Thereupon the automatic mechanism of the pleasure pain principle is brought into play and carries through the repression of the dangerous impulse

Stop! you will exclaim we cannot go so far as that with you You are right I shall have to add something to what I have said to make it seem acceptable to you First of all I must admit that I have tried to translate into the language of our normal thought a process which is in fact certainly neither conscious nor preconscious and which takes place between charges of energy at some deep level of the mind that it is hard to picture But that is not a very serious objection it could not be done in any other way It is more important that we should clearly distinguish between what goes on in the ego and what goes on in the id during the process of repression We have just explained what the ego does It makes use of an experimental cathexis and by means of a danger signal [illegible] pain m[illegible] possibl[illegible] proportions Either the anxiety attack develops completely and the ego withdraws entirely from the objectionable excitation or in place of the experimental cathexis the ego meets the excitation with an anti cathexis (counter charge) which then combines with the energy of the repressed impulse to form a symptom or is taken up into the ego as a reaction formation as an intensification of certain dispositions as a permanent alteration of the ego The more the development of anxiety can be restricted to a mere signal the more the ego can make use of defensive acts which amount to a mental binding of the repressed and the more the process approximates to the standard of a normal modification of the impulse without of course ever reaching it Here I shall digress for a moment or so You will no doubt yourselves have assumed that the thing which is so hard to define but which we call *character* must be thought of as belonging entirely to the province of the ego We have already learned something of what it is that creates this thing called character The incorporation of the early parental function in the shape of the super ego is no doubt the most important and decisive element next come identifications with the parents of a later date and with other persons in authority and the same identifications as precipitates of abandoned object relations We can now add to this list as contributions to character formation which are never absent the reaction formations which the ego acquires first in making its repressions and later in a more normal way in repudiating undesirable impulses

Now let us go back to a consideration of the id It is not so easy to discover what it is that happens during the process of repression to the impulses that are being opposed The main question to which we want to know the answer is What happens to the energy to the libidinal charge of the impulse and how is it used? You will remember that my earlier hypothesis was that it was precisely this energy that was turned into anxiety We can however no longer venture to say that we must content ourselves with a more modest answer Its fate is probably not always the same Probably there is a close correspondence between what happens in the ego and what happens in the id with respect to the repressed impulse and it should be possible to learn something of its nature For since we have adopted the view that the pleasure pain principle is brought into action in response to the danger signal and plays a part in repression we are obliged to modify our anticipations This principle has unrestricted sway over the processes in the id We can credit it too with the power of bringing about very profound changes in the impulse in question We are therefore prepared to believe that the effects of repression will be very varied and sometimes more and sometimes less extensive In many cases the repressed impulse may retain its libidinal cathexis and continue to exist unaltered in the id although under the perpetual pressure of the ego In other instances it seems to undergo complete destruction in which case its libido is finally diverted into other channel I have suggested that this is what happens where the Oedipus complex is dealt with normally In this desirable state of affairs the Oedipus complex would thus not merely be repressed but would be actually destroyed in the id Clinical experience has further taught us that in a great many cases instead of the usual result of repression a degradation of the libido takes place a regression of the libidinal organization to an earlier stage of development That can naturally only happen in the id and when it does happen it must be under the influence of the same conflict that

wa introduced by the danger signal The mo t remarkable examp e f this s to be found in the bses ional euros where repres n of Eb d and repres on go hand in ha d

Ladies a d Gentlemen—I am afraid that this accoun will seem to you very difficult to fol low and you will gues tha it is by no means a com ete one I m orry to ha e caused ou annoyance M o y a m, however mus be to give you some im ression of the n ture of our findings and f the difficulties w h e to face in dealing with them The deeper we p obe in our t dy of mental proce es the more we become ware of the richness and com lexity of their content. Many s mple form las wh ch seemed to us t first t meet the ca e turned out later to be inadequate. We are nce on l a e ... and improvin them In my lectu on the theory f dreams I led you into a field of knowledge in which hardly a singl ew discovery has been m de in the l t fift en ears here where we are dealing with anx ty every thing is in a t te of flux and change Thes new f dings ha e not et been tho oughly worked o e a d perhaps for that ry ea on their expos tion is difficult H we e ou must have pa ence we hall on be ble t lea e t problem of anxiety though that doe not mean that t will have been s l ed t ou satis f c on. I hope howeve that we ha e ad vanced a tep further And incident lly we ha e cquired much fresh knowledge Thus we are now ab through the tud of anx t t add a fresh trait to our charact rizati of th ego We ha e said that the ego is weak n r la tion to the d, that t ts faithf l serva t, and th t tries to carry t its rd rs and ful fil s requirements We ha o intent on of withdrawing this a sert on. But the othe hand th ego is the better organ ed part of the id orientated as t is to a ds re lit We must n t exaggerate too m ch th separation between the two and w must ot b surp sed if t ego too on ts de exerts an infl ence on t processes in th d. I think th ego exerts n influence f this kind when it ets the all-powerful pleasure-pain principl n mo tion by means f th danger s gnal. It is true that immediately fterwards t displays ts weakness gain, for b t ct f repression it renoun es a portion of ts organizatio and is forced t llow th repressed impul t re main permanently withdrawn f om ts influence

And ow just e more point in regard to t problem f anxiety Neurotic anxiety has under our hands, turned int bjecti anxiety into anxiet f lt towards certain external d n g r tuat ons But we cannot leave at that we mu t take a step further thou h i a sen e it will be step backwards What is t that is actually dangerous and ctually feared in uch

danger-s tuat on It is clearl not the objec tive injury which need h e absolutel no importa ce ps chologicall but t s something which is et up in the m d b t Birth for example our proto pe for the tate of anxiety can hardly in itself be regarded s injury altho gh it may in ol e a risk of i j ry The ho b rth s bo every

by charge Let call such a uation in wh h the eff rts of the pleasure principle come t nothing a traumat c fact r in th t way by following the series—neurotic anxiety-object e anxiety-dan r s tuation—we can arrive at a simpl form la what s fea ed the obj ct of th anxiety is always the merger of a trau matic factor which cann t be d l w th in accordance with the norms of the p eas re principle W can immedia ly see that the perati of the plea ure-principle does no guarantee us gain t objective injury but only again t particular i jury to o mental econ om From th plea ure princi le t the in t ct f self preservation s a lon wa and the two tendencies are f r from coinciding from the first We an observe som thin lse howe and perhaps this i t e sol t on fo which w were looking I ha e m nd the fact that ll along we are dealin w th questi ns of relati quant ties It only the magnitude of the e cit tion whi h turns an mp es on into a traumatic f ctor which pa alyzes the opera t n of the plea ure prin ipl and g ves gn fi cance to the danger-s tuation. And f this is really the case if these problems admit of uch a imple s tion why ho ld t n t be pos b e that traumat f ctors of thi kind hould occur in the mental life w thout relation t the suppo ed da ger s tuati traumat c fact rs in regard t which anxiety is n t arou-ed a

gnal, but manifests it elf fresh and f new rea n Clin cal experience d finit ly t lls us that this ctually occurs Only the l repres s ns display the mechanism which we ha e described in which anxiety is called f rth a signal f an earlier danger tuation the earli es and most fundamental epres s are directly f om traumatic f ctors where th eg comes into contact with n exces ve l'b dinal

figures about over a map before setting his troops in motion In this way the ego anticipates the satisfaction of the questionable impulse and enables it to reproduce the painful feelings which are attached to the beginning of the dreaded danger situation Thereupon the automatic mechanism of the pleasure pain principle is brought into play and carries through the repression of the dangerous impulse

Stop! you will exclaim we cannot go so far as that with you You are right I shall have to add something to what I have said to make it seem acceptable to you First of all I must admit that I have tried to translate into the language of our normal thought a process which is in fact certainly neither conscious nor preconscious and which takes place between charges of energy at some deep level of the mind that it is hard to picture But that is not a very serious objection it could not be done in any other way It is more important that we should clearly distinguish between what goes on in the ego and what goes on in the id during the process of repression We have just explained what the ego does It makes use of an experimental cathexis and by means of a danger signal sets in motion the automatic pleasure pain mechanism Several reactions then become possible or a combination of them in various proportions Either the anxiety attack develops completely and the ego withdraws entirely from the objectionable excitation or in place of the experimental cathexis the ego meets the excitation with an anti cathexis (counter charge) which then combines with the energy of the repressed impulse to form a symptom or is taken up into the ego as a reaction formation as an intensification of certain dispositions as a permanent alteration of the ego The more the development of anxiety can be restricted to a mere signal the more the ego can make use of defensive acts which amount to a mental binding of the repressed and the more the process approximates to the standard of a normal modification of the impulse without of

[illegible]

thought of as belonging entirely to the province of the ego We have already learned something of what it is that creates this thing called character The incorporation of the early parental function in the shape of the super ego is no doubt the most important and decisive element next come identifications with the parents of a later date and with other persons in authority and the same identifications as precipitates of abandoned object relations We can now add to this list as contributions to character formation which are never absent the reaction formations which the ego acquires first in making its repressions and later in a more normal way in repudiating undesirable impulses

Now let us go back to a consideration of the id It is not so easy to discover what it is that happens during the process of repression to the impulses that are being opposed The main question to which we want to know the answer is What happens to the energy to the libidinal charge of the impulse and how is it used? You will remember that my earlier hypothesis was that it was precisely this energy that was turned into anxiety We can however no longer venture to say that we must content ourselves with a more modest answer Its fate is probably not always the same Probably there is a close correspondence between what happens in the ego and what happens in the id with respect to the repressed impulse and it should be possible to learn something of its nature For since we have adopted the view that the pleasure pain principle is brought into action in response to the danger signal and plays a part in repression we are obliged to modify our anticipations This principle has unrestricted sway over the processes in the id We can credit it too with the power of bringing about very profound changes in the impulse in question We are therefore prepared to believe that the effects of repression will be very varied and sometimes more and sometimes less extensive In many cases the repressed impulse may retain its libidinal cathexis and continue to exist unaltered in the id although under the perpetual pressure of the ego In other instances it seems to undergo complete destruction in which case its libido is finally diverted into other channels I have suggested that this is what happens where the Oedipus complex is dealt with normally In this desirable state of affairs the Oedipus complex would thus not merely be repressed but would be actually destroyed in the id Clinical experience has further taught us that in a great many cases instead of the usual result of repression a degradation of the libido take place a regression of the libidinal organization to an earlier stage of development That can naturally only happen in the id and when it does happen it must be under the influence of the same conflict that

wa introduced by the dan_e s gnal. The mo t remarkable example of this is to be found in the bse_sional neuro whe e repress on of hand in h d.

this f l ans a complete one I am orry t d you annoya ce M o ly a m however mu t be to give you me impre o f the n tu e of our findings a d of the difficult es we h e t f ce in dealing with them The deeper we probe in our tudy of mental p oce es the more we become wa e f the richne s and compl xity

a tern and impro ing them In my lec t u the theory f dreams I led y u into a fie d of kn ledg in which hardly a single new dis covery has been mad in the la t fift en ye rs here where we are dealing with nxiety every thing is in t te of flux and ch nge These new fi dings ha e not et been tho oughly worked o er and pe haps for th t ery ea on their xpositio s difficult H weve ou must have patie c we shall soon be able to lea e the problem of anxiety thou h that does not mean t at t will ha e been sol ed to ur tis f ction. I hope h wever that we h e d- va ed a tep further And incidentally we ha acquired m ch fre h knowledge Thus we are ow abl throu h th study f x t to add a f esh trait t our characterizat o of the eg We ha e s d th t the ego weak n la tion to th d that t is ts f thful servant and th t t tries to carry out its orders nd ful fil ts requ ements W ha n intent n of th ra g this serti B t the ther hand the ego is th better rgan zed part of the id, orientated s it is tow ds l ty We must t exagg rat too much th epa at n between th two a d we m t n t be surp sed f th eg too ts de e rts an infl ence on th processes in the d I think th ego exerts influen e of this k d when t s ts the all-powerful plea ure p in pri ciple n mo tion by means of th dange -s gnal It is true th t immed at ly afterwards t displays ts weakness again, f by th act f ep es on it renoun s a porti n of ts organizat on a d is ed to ll w the ep essed impuls to main permanently withdrawn from ts infl ence

And now j st one more point in regard to the problem f anxiety Neuroti nxi ty ha under our hands turned into objectiv a xiety nto anxiety felt towards certa n external dan ger tuations But we cannot lea e it at that we mu t take a step further thou h in a sen e it will be a tep backward Wh t is it th t is actually dange ous and actually feared in uch da ger-situatio ? It is clearly not the obj c ive injury wh ch need h e absolutely no importan e ps chol gically but t s someth ng wh ch i et up in the m d by it B rth for example our proto ype f r the state of anxiety can hardly in i elf be regarded s an njury although it may n olve a risk of njury The fundament l thing about birth, as about every da s tuat on i that it evokes in mental ex perience a co d tion of tense exc tation which s felt s pa n and which ca not be ma te ed by o charge Let us call such a s *uation* in wh ch the efforts of th pleasure principle come t oth ng a *t a mat c* factor in that wa by f ll wi g the eries—neurotic anx ety-object e anxiety dan e situati n—we can arrive at a s mple formul what is feared the object of th a xiety is always the mergence of a trau matic factor which cann t be dealt with in accorda ce w th the orms of the pleas re pr nc pl We can mmed atel see that the operat o of the plea ure pri ciple does not gua nt e us ag in t obj ct ve inj ry but nly agam t particul injury t our m tal econ my From th plea re princi le to the in t nct of s lf p es rvation is a long w y d the two t ndencies a e f r fr m coinciding from th first We an ob erve som thin l howe er and pe h ps this is the s l ti n for which w we e looking I have in m d the f ct that all al g w a d al g w th quest ns of el t e qua tities It is only th magn tude of the e c t ti n which turns an imp es on into tr umat c f ctor whi h paralyzes the opera ti n of the plea ur pri cipl a d g ves m fi ca ce to the d ger- t ti n And f th s really the c se f th se p oblems adm t of su h mple lut why should t ot be po ble that traumati f tors f th s kind hould

rea o Cli cal experience definitely tell us that thi act ally occurs Only the late rep es s d pl y the mechani m which w h e des bed in wh ch nx ty s called f rth a s gnal of an earli dang r tu ti n the ea li es and m t fundame tal rep ess ons ari e dir ctly from traumatic f ctors wher the ego m s into c t ct w th a c e l b d al

figures about over a map before setting his troops in motion In this way the ego antici pates the satisfaction of the questionable im pulse and enables it to reproduce the painful feelings which are attached to the beginning of the dreaded danger situation Thereupon the automatic mechanism of the pleasure pain principle is brought into play and carries through the repression of the dangerous impulse

Stop! you will exclaim we cannot go so far as that with you You are right I shall have to add something to what I have said to make it seem acceptable to you First of all I must admit that I have tried to translate into the language of our normal thought a process which is in fact certainly neither conscious nor preconscious and which takes place between charges of energy at some deep level of the mind that it is hard to picture But that is not a very serious objection it could not be done in any other way It is more important that we should clearly distinguish between what goes on in the ego and what goes on in the id during the process of repression We have just ex plained what the ego does It makes use of an experimental cathexis and by means of a dan ger signal sets in motion the automatic pleasure pain mechanism Several reactions then become possible or a combination of them in various proportions Either the anxiety attack develops completely and the ego withdraws entirely from the objectionable excitation or in place of the experimental cathexis the ego meets the ex citation with an anti cathexis (counter charge) which then combines with the energy of the repressed impulse to form a symptom or is taken up into the ego as a reaction formation as an intensification of certain dispositions as a permanent alteration of the ego The more the development of anxiety can be restricted to a mere signal the more the ego can make use of defensive acts which amount to a mental binding of the repressed and the more the process approximates to the standard of a nor mal modification of the impulse without of course ever reaching it Here I shall digress for a moment or so You will no doubt yourselves have assumed that the thing which is so hard to define but which we call *character* must be thought of as belonging entirely to the province of the ego We have already learned something of what it is that creates this thing called char acter The incorporation of the early parental function in the shape of the super ego is no doubt the most important and decisive ele ment next come identifications with the par ents of a later date and with other persons in authority and the same identifications as pre cipitates of abandoned object relations We can now add to this list as contributions to char acter formation which are never absent the reaction formations which the ego acquires first in making its repressions and later in a more normal way in repudiating undesirable impulses

Now let us go back to a consideration of the id It is not so easy to discover what it is that happens during the process of repression to the impulses that are being opposed The main question to which we want to know the answer is What happens to the energy to the libidinal charge of the impulse and how is it used? You will remember that my earlier hypothesis was that it was precisely this energy that was turned into anxiety We can however no longer ven ture to say that we must content ourselves with a more modest answer Its fate is prob ably not always the same Probably there is a close correspondence between what happens in the ego and what happens in the id with respect to the repressed impulse and it should be pos sible to learn something of its nature For since we have adopted the view that the pleasure pain principle is brought into action in re sponse to the danger signal and plays a part in repression we are obliged to modify our anticipations This principle has unrestricted sway over the processes in the id We can credit it too with the power of bringing about very profound changes in the impulse in question We are therefore prepared to believe that the effects of repression will be very varied and sometimes more and sometimes less extensive In many cases the repressed impulse may re tain its libidinal cathexis and continue to exist unaltered in the id although under the per petual pressure of the ego In other instances it seems to undergo complete destruction in which case its libido is finally diverted into other channels I have suggested that this is what happens where the Oedipus complex is dealt with normally In this desirable state of affairs the Oedipus complex would thus not merely be repressed but would be actually destroyed in the id Clinical experience has further taught us that in a great many cases instead of the usual result of repression a deg radation of the libido takes place a regression of the libidinal organization to an earlier stage of development That can naturally only happen in the id and when it does happen it must be under the influence of the same conflict that

for the satisfaction of another. It must be freely admitted, however, that we are not very [illegible] explanation of this. The rela[illegible]

[illegible] is the more easily loosened [illegible]. There is a particular kind of modification of aim and change of object with regard to which other social values come into the picture to this we give the name of sublimation. We have also grounds for the differentiation of what we call [illegible] instincts; these proceed from [illegible] sources and have uninhibited aims but [illegible] on their way to satisfaction with the result that permanent object-cathexes and an enduring driving force come into being. Of such a kind, for instance, is the feeling of affection, whose source undoubtedly lies in sexual needs but invariably renounces their gratification. We are, as you see, still in ignorance about many of the characteristics of the instincts and their history. We ought here to mention another distinction between the sexual instincts and the instincts of self-preservation which would be of the utmost theoretical importance if it applied to the whole group. The sexual instincts are remarkable for their plasticity, for the facility with which they can change their aims, for their interchangeability—for the ease with which they can substitute one form of gratification for another, and for the way in which they can be held in suspense, as has been so well illustrated by the aim-inhibited instinct. It would be convenient if we could assert that these characteristics do not apply to the instincts of self-preservation, and that the latter are inflexible, do not allow delay, are far more imperative and respond quite differently to repression and anxiety. On reflection, however, we see that this peculiarity does not apply to all the ego-instincts but only to those of hunger and thirst, and is clearly due to the special nature of their instinctual sources. A great deal of our perplexity also arises from the fact that we have not devoted any attention to the alterations which the instinctual impulses originally belonging to the id undergo under the influence of the organized ego.

We find ourselves on firmer ground when we turn to the question of how the instinctual life serves the sexual function. Here we have obtained decisive information; but you are already familiar with it. We do not, that is to say, believe that there is a single sexual instinct, which is from the first the vehicle of the impulse towards the aim of the sexual function, that is, the union of the two sex cells. On the contrary, we see a large number of component instincts arising from various regions of the body, which strive for satisfaction more or less independently of one another, and find this satisfaction in something that may be called *organ pleasure*. The genitals are the latest of these *erotogenic zones*, and their organ pleasure must certainly be called *sexual*. Not all of these pleasure-seeking impulses are incorporated in the final organization of the sexual function. Many of them are put aside as useless, by means of repression or in some other way; some of them are deflected from their aims in the remarkable manner which we have already mentioned and used for the strengthening of other impulses, while others persist, but play minor parts, and serve the purpose of bringing about preliminary actions and of arousing fore-pleasure. You have heard that in this long-drawn-out course of development several phases of provisional organization are to be recognized, and that aberrations and maldevelopments of the sexual function are to be explained by reference to its history. The first of these *pregenital* phases is called the *oral* phase because, in accordance with the fact that the infant is nourished through the mouth, the erotogenic zone of the mouth dominates what we may call the sexual activity of this period of life. At a second stage the *sadistic and anal impulses come to the fore*, obviously in connection with the cutting of the teeth, the strengthening of the musculature and the control of the sphincters. We have learnt a great many interesting details about this remarkable stage of development in particular. Third comes the *phallic* phase, in which, for both sexes, the penis (and what corresponds to it in the girl) achieves an importance which can no longer be overlooked. We have reserved the name of *genital* phase for the final sexual organization, established after puberty, in which the female genitals receive for the first time the recognition which the male genitals have long since obtained.

So far all this has been mere recapitulation. And you must not suppose that the things which I have omitted to mention this time no longer hold true. This recapitulation was necessary so that we could have a starting-point for our account of the further advance in our knowledge. We can flatter ourselves that we have obtained a great deal of new information

demand these traumatic factors create their own anxiety anew though in accordance with the pattern of the birth situation The same may be true of the development of anxiety in anxiety neuroses caused by somatic injury of the sexual function We shall no longer maintain that it is the libido itself th [illegible] f [illegible] a traumatic factor and secondly as a signal that a traumatic factor of this kind threatens to recur

Ladies and Gentlemen—I am sure you are delighted with the prospect of hearing no more about anxiety But your delight will be shortlived for what is to follow is no better I propose to take you straight on to the subject of the theory of the libido or of the instincts for there too many new developments have occurred I cannot say that we have made any very great progress or that any trouble you may take in learning about it will be amply rewarded No it is a field in which we are struggling hard to get some sort of orientation and understanding you will only be witnesses of the efforts we are making Here too I shall have to repeat much that I put before you in my earlier lectures

The theory of the instincts is as it were our mythology The instincts are mythical beings superb in their indefiniteness In our work we cannot for a moment overlook them and yet we are never certain that we are seeing them clearly You know how popular thought deals with the instincts It postulates as many different instincts as may be needed an instinct of assertiveness instincts of imitation and play a social instinct and a great many more besides It takes them up as it were lets each do its particular work and then drops them again We have always suspected that behind this multitude of small occasional instincts there lies something much more serious and powerful which must be approached with circumspection Our first step was tentative enough We felt we should probably not go far wrong if we started by distinguishing two main instincts or species or groups of instincts corresponding to our two great needs—hun er and love However jealously we may in other connections have defended the independence of psychology from all other sciences nevertheless we are here overshadowed by the immutable biological fact that the living individual serves two purposes self preservation and the preservation of the species which seem to be independent of each other which we have not been able to trace back to a common source and whose interests often conflict in animal life Here we are really discussing biological psychology we are studying the psychological concomitants of biological processes In accordance with this view we introduced the *ego-instincts* and the *sexual instincts* into psychoanalysis Under the former heading we placed everything that had to do with the preservation maintenance and advancement of the individual To the latter we ascribed the rich content implied in infantile and perverse sexual life Our investigation of the neuroses led us to regard the ego as the restricting and repressing force and the sexual impulses as the restricted and repressed ones with the result that we thought we had firmly grasped not only the difference between the two groups of instincts but the conflict between them At first the objects of our studies consisted only of the sexual impulses whose energy we called the *libido* From the study of them we tried to make out what an instinct was and what attributes it possessed At this point we reach the theory of the libido

An instinct differs from a stimulus in that it arises from sources of stimulation within the body operates as a constant force and is such that the subject cannot escape from it by flight as he can from an external stimulus An instinct may be described as having a source an object and an aim The source is a state of excitation within the body and its aim is to remove that excitation in the course of its p th from its source to the attainment of its aim the instinct becomes operative mentally We picture it as a certain sum of energy forcing its way in a certain direction We speak of active and passive instincts but we ought rather to speak of active and passive instinctual aims for an expenditure of activity is required even in order to attain a passive aim The aim can be attained in the subject s own body but as a rule an external object is introduced in which the instinct attains its external aim its internal aim is always a somatic modification which is experienced as satisfaction Whether the relation to a somatic ource gives the instinct any specific characters and if so which is not at all clear The evidence of analytic experience proves conclusively that instinctual impulses from one source can join on to instinctual impulses from another and share their further vicissitudes and that in general the satisfaction of one instinct can be substituted

t rna is in the dm rable phrase f Lou A.nrea-S.lom hired out from the ectum a.d in th lives of homosexual who have not g beyond a certa n tage n the r exual devel pment the vagina is onc m re represented by th .nus In dreams we often meet with a p ce which was form ly a n le room but is now d ded into tw by a partition wall, or vice ersa This always refers to the relation o t. vagina to the rectum We can al.o follow very clea l the way in which m   girl the entirely m emmine des e for t.e posses.ion of a penis n rmal turns into the desire fo a ch.d, a d then fo a man as the bearer of the penis a d the gi er of the child, so that in this case too   can see how an element of what w o .gnally an anal-erotic interest is taken in o the la er genital organiza o

precisely about th matter of the early organi z tions of the libido and that we have a better understanding of what we already knew—in proof of which I will give you a few instances In 19 4 Abraham showed that we can differ entiate two stages in the adistic anal phase In the former of these the destructive tend encies to annihilate and to get rid of things h ve the upper hand while in the latter those tendencies predominate which are friendly to the object and seek to possess things and hold them f st In the middle of this phase then there appears for the first time a consideration for the object which is a forerunner of a later relation of love towards the object We are equally justified in assuming a similar subdi vision in the first or oral pha e In the earlier stage of it we only have oral incorpor tion and there i no ambivalence in the relation to the object i e the mother s breast The second st ge which is distinguished by the onset of he *oral sadistic* irst manifesta come so much more obvious in the next or sadistic anal phase The value of these new differentiations becomes especially clear when we want to discover the predispositional points of the libidinal development in the case of certain neuroses—such as obsessional neurosis and mel ancholia I need only recall to you here what we have learnt on the subject of fixation of libido predisposition and regression

Our attitude to the phases of libidinal or ganization has in general altered somewhat We used formerly to emphasize the way in which one phase gives place to the next nowadays we direct our attention more to the facts which indicate how much of each earlier phase per orgin

those investigations which have su frequently under pathological conditions re-gression to earlier phases takes place and that certain regre sions are characteristic of certain forms of illness I cannot however go into that question here it is a matter for a special ized treatise on the psychology of the neuroses

We have been able to study the transforma tion of instincts and similar processes espe cially with reference to anal erotism in which the impulses have their source in the erotogenic anal zone and we are surpri ed to find the multiplicity of the channels along which these in tinctual impulses can be directed It is perhaps not easy to free oneself from the con temptuous attitude which we have come to adopt towards this particular zone during the course of our development It is as well there fore to bear in mind Abraham s reminder that embryologically the anus corresponds to the primitive mouth which has moved down to the end of the bowel It appears then that when in the course of development the individual comes to feel disfavour for his own faeces or excrement his instinctual interest arising from anal sources passes over to objects which can be given away as gifts And rightly so for faeces were the first gift that the infant could make and he parted with them out of love for the person who looked after him Subsequently the old interest in faeces turns into an appre ci tion of gold and money and also makes a contribution to the affective cathexis attaching to the ideas of child and penis It is the view of all children who as we know cling to the cloaca theory for a long time that babies are born out of the bowel like a piece of faeces defecation is the prototype of the act of birth But the penis too has its forerunner in the column of feaces which fills the mucous mem brane tube of the bowel and stimulates it When the child has unwillingly imbibed the knowl edge that there are human beings who do not possess a penis that or an seems to him some thing which can be detached from the body and an unmistakable analogy is drawn between it and the excrement which was the first piece of bodily substance that had to be given up A large quantity of anal erotism is thus trans ferred to the cathexis of the penis But the intere t in that part of the body has besides an anal erotic basis a perhaps even more pow erful root in oral erotism for in accordance with the situation of sucking the penis derives a great deal from the nipple of the mother s breast

It is impossible to have any understand ng of people s phantasie or of associations which occur under the influence of the unconscious or of the language of symptoms if one does ow hout the e deep-lying connections

represented by the same sym not forget that I can only give you very in complete information on the subject I will however add in passing that the late aw akening interest in the vagina is mainly of anal erotic derivation This is not to be wondered at since

fmaiben. One cannot put forward a hypothesis th is so far reach.... umph on the ground t.. a few poor fools ha e attached a curious tend..cy to thei exual s tisfaction. I think t... a deeper t d f the instincts will gi e us wh we w... The instincts do not only dom.. e mental life but vegetati e Life as well, and these organic instincts displa a char acteristic which merits our most eri us tten tion. Whether t is a general characteristic of all in tincts we hall only be ble t decide later. They turn out to be directed towards the reinstatement f an ea lier state of things. We may assume that, as soon as a gi en tate of things is upset, th re arises an instinct to re-create it, and phenomena appear which we may call *re t on-compulsion* Embryology fo m stance, is n th... but repetit n-compulsion stretching far back in the animal series we find a capacity to form afresh rgans which have been lost, a..d the instin t of reco ery to which, a.ongside of ur therapeutic acti t es we owe our power t get well, may be th re-mains f this capacity which is o wonderfully developed in th l wer animals Th spawning migrations of fi.h a..d pe ..aps the migrations o birds, possibly all th t we describe as a manifestation of *instinct* in animals takes place under t..e domination f repetition-compulsion ..ch expresses th *conservative nature* of in stincts. A..d in t..e realm of the mi..d, too w ...... n t h..ve far t seek for ev dence of th presence of that mpulsion. It has alwa s surprised us that the forgotten and repressed experiences f ea.ly childhood hou.d repro-duce themselves in dreams and reactions during analytic treatment, especially in the reactions in olved in the transf rence alth ugh their reawakening runs counter t t..e interests of t.. p easure-principle and we ha e explained this by saying that in such cases repetition compulsion has overcome even the p easure-principle Ou..d analysis too one can observe the s..m t...g. There are peopl wh ll their li es repea to their own d riment the sam reactions witho an correction or wh seem t be doomed b relentless ill fortune though a closer investigation ows that they are unwittingly bringing this ill f rtun upo them se es. Thus we explain what called *d mon c* character as being due to th repetition-com pu on.

B.. how can this conservative quality of in stincts help us to understand t..e elf-destruc tive tendency What is the earlier ta e of things that such an instinct is trying to rein-state? Now the answer to this question lies near at hand, and opens up a wide vi.ta of possibilities If it is true that once in an incon ceivably remote pa.t, a..d in an unimaginable way life arose out of inanimate ma ter then in accordance with our hypothesis, an instinct must at that time ha e come into being who-e aim t was t aboli.h life once more and to re establi.h the *inorganic state of things*. If in this instinct we recognize the impulse to self destruction of our hypothesis then we can regard that impul.e as the manifestat on of a *death instinct* which can never be absent in any vital process. And now the instincts in which we believe separate themselves into two groups the erotic instincts which are alwa s trying t collect li... substance together in o ever larger unities a..d the death in tincts whi h act again.t that tendency and try to brin.. li ing matter back int an inorganic con ditio The co-operation and oppos tion of these two forces produce the phenomena of life to which death pu s an end

You will perhaps hrug our shoulders and sa That is not natural cience that is the philosoph of Schopenhauer But Ladies nd Gentlemen why hould n t bold thinker ha e divined something that a sober and pain.tak ing in est gat on of d ails bsequently con firm And after all everythin has been sa d already and man people said the same thing before Schopen..auer And besides w..at we ha e sa.d is not even true Schopenhauer We d not assert that death is the only aim of l fe we *do not ove look the prese ce of life by the* side of death. We recognize two fundamental in.tinct. and scribe to each of them ts own aim How th two mingle in th vital process how th death in.tinct is pres.ed int the serv c of Eros, especially when it i turned outwards in th form of aggres i eness—these are problems w..i h remain for future invest ga ti n. We can go n further than the point at which this prospect opens up before us. The quest on wheth all in tinct without except on do not pos es a conservati character wh ther the erot instincts also do not eek the rein st t ment of an e li r tate f thi gs when they tr e t wards the synthes f li ing ub-stance into larger wh les—this quest on too must be l ft unanswered.

We ha e wand ed omewhat far from our thes.s but I will tell you th tarting point of these reflections upon th theory of the in tincts. It was the same thin that led us t revi. on of the relation between the ego and the uncon-

occasionally shows himself to be brutal violent and cruel these are only passing disturbances of his emotional life mostly provoked and perhaps only the consequence of the ill adapted social system which he has so far made for himself

Unfortunately the testimony of history and our own experience do not bear this out but rather confirm the judgment that the belief in the *goodness* of man nature is one of those unfortunate illusions from which mankind expects some kind of beautifying or amelioration of their lot but which in reality bring only disaster We need not proceed with this polemic for it is not on account of the teaching of history and of our own experience of life that we maintain the hypothesis of a special *instinct of aggression and destructiveness in* man but on account of general considerations to which we were led in trying to estimate the importance of the phenomena of *sadism* and *masochism* You know that we use the word *sadism* when sexual satisfaction depends upon the sexual object suffering pain ill treatment and humiliation and the word *masochism* when the subject himself has to suffer such treatment You know too that there is a certain admixture of these two tendencies in normal sexual relations and that we call them *perversions* when they thrust the other sexual aims into the background and substitute their own aims for them It can hardly have escaped you that sadism has a close connection with masculinity and masochism with femininity as if there were some secret relationship between them I must tell you at once that we have made no further progress along this path Both of them sadism and masochism are very hard to account for by the theory of the libido and especially masochism and it is only right and proper that the stone which was an obstacle to the one theory should become the corner stone of the other

For we believe that in sadism and masochism we have two admirable examples of the fusion of the two kinds of instincts Eros and aggressiveness and we now put forward the hypothesis that this relationship is typical and that all the instinctual impulses that we can study are made up of such fusions or alloys of the two kinds of instincts Naturally they are to be found mixed in the greatest variety of proportions To this mixture the erotic instincts will contribute the whole multiplicity of their sexual aims while the others will admit only of mitigation and graduation of their uniform tendency This hypothesis opens up a line of investigation which may some day be of great importance for the understanding of pathological processes For fusions may be undone and such defusions of instincts may be expected to bring about the most serious consequences to adequate functioning But this point of view is still too new no one has so far attempted to make practical use of it

Let us return to the specific problem which is presented by masochism If we put its erotic components on one side for a moment it proves the existence of a tendency which has self destruction as its aim We have already stated that the ego (or rather as we should here say the id the whole personality) originally includes all the instinctual impulses if *this applies equally to the destructive instinct,* it will follow that masochism is older than sadism and that sadism is the destructive instinct directed outwards thereby acquiring the character of aggressiveness Varying quantities of the original destructive instinct may still remain inside the organism it seems as though we could only perceive it under two conditions either when it is bound up with the erotic instincts so as to form masochism or when it is turned on to the external world (with a greater or lesser erotic addition) in the shape of aggressiveness We are now led to consider the important possibility of the aggression being unable to find satisfaction in the external world because it comes up against objective hindrances It may then perhaps turn back and increase the amount of self-destructiveness within We shall see that this actually occurs and that it is an event of great importance It would seem that aggression when it is impeded entails serious injury and that we have to destroy other things and other people in order not to destroy ourselves in order to protect ourselves from the tendency to self destruction A sad disclosure it will be agreed for the moralist

But the moralist will for a long time to come console himself with the improbability of our speculations It is indeed a strange instinct that is occupied with the destruction of its own organic home! It is true that the poets speak of things of this sort but poets are irresponsible beings they enjoy the privilege of poetic licence But after all such ideas are not foreign to physiology where we find for instance the mucous membrane of the stomach digesting itself But it must be admitted that our instinct of self-destruction requires more con

firmation One cann t put forward a hypothesis that is so far eaching simply on the grou d that a few p or fool h ve atta hed a curious cond tion to the r sex al satisf ction I th nk that deeper study of the instincts will g ve us what e wa t The instincts do not only ment l life but veg t t ve life as

r inst teme t of an earli r stat l m s e m y assume that as soon as a given state of things i upset the e arises an inst nct to re- t ate it and ph n mena app ar which we may call *ep t t o comp lsio* Embryology for in stan is nothi g but a epet t on compulsion stretching f back in th animal seri s we find a cap c ty to form fre h o gans which have been lost and the inst ct of recovery to h h al g de of our ther peut c act ties we o e ou pow r to get well m y be the re m in of this c pac ty which is so w nderfully dev loped n the lowe a m ls The spawning mig at s of fish a d pe hap the m grat ons of b ds p s'bly all that we descr'be as a m f st tion f *in t nct* in an mals tak s place und r th d m nat on f r pet tio -compulsi n h ch xp e ses the *c s rv t ve natu e* of n stin ts And in the re lm of the mind t o we sh ll n t h f r to s ek for evidence of the presen e of th t c mpul on It has alw ys surpri d u that the f gott n nd repre sed experiences of ea ly childhood sh uld r pr du e them el es in d e ms and eactio s d g analyt c t eatme t sp cially in the react ons in l ed in the tra ference altho gh th re w ken ng run count r to th inter sts of the pl as e p inciple and we h ve xpl n d t.. s by saying that su h ca es pet t on compul on has o e ome even the pleasu e prin ple Outs de analys too one can bserve the s me th g Th are p opl who all the r li es repeat to the r wn detriment th s me rea t s th t y c rr ct on or who seem t be dogg d by a le tl ss ill fort e though a closer in stigat on h ws that they re un ttingly bringi g th s ill f t e upon them sel Thus we expl what is c lled a *demon c* charact r a being due to th repet tion-com pul n

B t h w can this conserv t e qu l ty of in stin ts h lp u to understand the s lf destruc tive t dency? Wh t is the ea l er tate of things that such an instinct s trying to rein state? Now the answer to this quest on lies near at hand and opens up a wide vista of possibilities If it is true that once in an incon cei ably remote past and in an un mag nable way life arose out of inan mate matter then in accord nce with our hypothes s an instinct must at that time have come into be ng whose a m it was to abolish life once more and to re stabl sh the norganic state of things If in this instinct we ecognize the impulse to self destruction of our hypothesis then we can rega d that mpulse as the manifestation of a *death inst ct* which can never be absent in a y vit l p cess And now the instincts in which we bel eve separate themselves into two groups the e otic i st ncts which are always try ng to collect l ng substa ce together into ever larger un ties and the death insti cts which act against that tendency and try to bring livi g matter b ck into an ino ganic con d t on The co-ope at on and opp sit on of these tw forces p oduce the phe omena of life to which death puts an end

You w ll pe hap shrug your shoulders and say Th t is ot natural scie ce that is the ph lo ophy of Schopenhauer B t Lad es and G ntlemen why should not a bold thinker have d in d s m th g that a sober and pa nstak ing invest gat on of det ls subsequently con firms? occasionally shows himself to be brutal vio lent and cruel these are only passing disturb ances of his emotional life mostly provoked and perhaps only the consequence of the ill adapted social system which he has so far made for himself

Unfortunately the testimony of history and our own experience do not bear this out but rather confirm the judgment that the belief in the *goodness* of man s nature is one of those unfortunate illusions from which mankind ex pects some kind of beautifying or amelioration of their lot but which in reality bring only disaster We need not proceed with this po lemic for it is not on account of the teaching of history and of our own experience of life that we maintain the hypothesis of a special instinct of aggression and destructiveness in man but on account of general considerations to which we were led in trying to estimate the importance of the phenomena of *sadism* and *masochism* You know that we use the word *sadism* when sexual satisfaction depend upon the sexual object suffering pain ill treatment and humiliation and the word *masochism* when the subject himself has to suffer such treatment You know too that there is a certain admixture of these two tendencies in normal sexual relations and that we call them *perversions* when they thrust the other sexual aims into the background and substitute their own aims for them It can hardly have escaped you that sadism has a close connection with masculinity and masochism with femininity as if there were some secret relationship be tween them I must tell you at once that we have made no further progress along this path Both of them sadism and masochism are very hard to account for by the theory of the libido and especially masochism and it is only right and proper that the stone which was an obsta cle to the one theory should become the corner stone of the other

For we believe that in sadism and masochism we have two admirable examples of the fusion of the two kinds of instincts Eros and aggres siveness and we now put forward the hypothe sis that this relationship is typical and that all the instinctual impulses that we can study are made up of such fusions or alloys of the two kinds of instincts Naturally they are to be found mixed in the greatest variety of propor tions To this mixture the erotic instincts will contribute the whole multiplicity of their sex ual aims while the others will admit only of miti ation and graduation of their uniform tendency This hypothesis opens up a line of investigation which may some day be of great importance for the understanding of patholog ical processes For fusions may be undone and such defusions of instincts may be expected to bring about the most serious consequences to adequate functioning But this point of view is still too new no one has so far attempted to make practical use of it

Let us return to the specific problem which is presented by masochism If we put its erotic components on one side for a moment it proves the existence of a tendency which has self destruction as its aim We have already stated that the ego (or rather as we should here say the id the whole personality) origi nally includes all the instinctual impulses if this applies equally to the destructive instinct it will follow that masochi m is older than sadism and that sadism is the destructive in stinct directed outwards thereby acquiring the character of aggressiveness Varying quantities of the original destructive instinct may still remain inside the organism it seems as though we could only perceive it under two conditions either when it is bound up with the erotic in stincts so as to form masochism or when it is turned on to the external world (with a reater or lesser erotic addition) in the shape of ag gressiveness We are now led to consider the important possibility of the a gression being unable to find satisfaction in the external world because it comes up against objective hin drances It may then perhaps turn back and increase the amount of self-destructiveness within We shall see that this actually occurs and that it is an event of great importance It would seem that aggression when it is impeded entails serious injury and that we have to destroy other things and other people in order not to destroy ourselves in order to protect ourselves from the tendency to self destruction. A sad disclosure it will be agreed for the moralist

But the moralist will for a long time to come console himself with the improbability of our speculations It is indeed a strange in stinct that is occupied with the destruction of its own organic home! It is true that the poets speak of things of this sort but poets are irre ponsible bein s they enjoy the privilege of poetic licence But after all such ideas are not foreign to physiology where we find for in stance the mucous membrane of the stomach digestin itself But it must be admitted that our instinct of self destruction requires more con

ment. One cannot put forward a hypothesis that is so far reaching, simply on the ground that a few poor fools have attached a curious condition to their sexual satisfaction. I think that a deeper study of the instincts will give us what we want. The instincts do not only dominate mental life but vegetative life as well, and these organic instincts display a characteristic which merits our most serious attention. Whether it is a general characteristic of all instincts we shall only be able to decide later. They turn out to be directed towards the reinstatement of an earlier state of things. We may assume that, as soon as a given state of things is upset, there arises an instinct to recreate it, and phenomena appear which we may call the *repetition-compulsion*. Embryology, for instance, is nothing but a repetition-compulsion; even far back in the animal series we find a capacity to form afresh organs which have been lost, and the instinct of recovery to which, alongside of our therapeutic activities we owe our power to get well, may be the remains of this capacity which is so wonderfully developed in the lower animals. The spawning migrations of fish and perhaps the migrations of birds, possibly all that we describe as a manifestation of *instinct* in animals, takes place under the domination of repetition-compulsion which expresses the *conservative nature* of instincts. And in the realm of the mind, too, we have not far to seek for evidence of the presence of that compulsion. It has always surprised us that the forgotten and repressed experiences of early childhood should reproduce themselves in dreams and reactions during analytic treatment, especially in the reactions involved in the transference, although their reawakening runs counter to the interests of the pleasure-principle, and we have explained this by saying that in such cases repetition-compulsion has overcome even the pleasure-principle. Outside analysis too we can observe the same thing. There are people who all their lives repeat to their own detriment the same reactions which seem to be dogged by a relentless ill fortune, though closer investigation shows that they are unwittingly bringing this ill fortune upon themselves. Thus we explain what is called a *demonic* character as being due to the repetition-compulsion.

But how can this conservative quality of instincts help us to understand the self-destructive tendency? What is the aim of the instinct that such an instinct is trying to reinstate? Now the answer to this question lies near at hand and opens up a wide vista of possibilities. If it is true that once in an inconceivably remote past, and in an unimaginable way, life arose out of inanimate matter, then, in accordance with our hypothesis, an instinct must at that time have come into being, whose aim it was to abolish life once more and to re-establish the inorganic state of things. If in this instinct we recognize the impulse to self-destruction of our hypothesis, then we can regard that impulse as the manifestation of a *death instinct*, which can never be absent in any vital process. And now the instincts in which we believe separate themselves into two groups: the erotic instincts, which are always trying to collect living substance together into ever larger unities, and the death instincts, which act against that tendency and try to bring living matter back to an inorganic condition. The co-operation and opposition of these two forces produce the phenomena of life to which death puts an end.

You will perhaps shrug your shoulders and say: That is not natural science, that is the philosophy of Schopenhauer. But, Ladies and Gentlemen, why should not a bold thinker have divined something that sober and painstaking investigation of details subsequently confirms? And after all everything has been said already, and many people said the same thing before Schopenhauer. And besides, what we have said is not even true Schopenhauer. We do not assert that death is the only aim of life; we do not overlook the presence of life by the side of death. We recognize two fundamental instincts and ascribe to each of them its own aim. How the two mingle in the vital process, how the death instinct is pressed into the service of Eros, especially when it is turned outwards in the form of aggressiveness—these are problems which remain for future investigation. We can go no further than the point at which this prospect opens up before us. The question whether all instincts without exception do not possess conservative character, whether the erotic instincts do not seek the reinstatement of an earlier state of things when they strive towards the synthesis of living substance into larger wholes—this question too must be left unanswered.

We have wandered somewhat far from our thesis, but I will tell you the starting point of these reflections upon the theory of the instincts. It was the same thing that led us to a revision of the relation between the ego and the uncon

occasionally shows himself to be brutal violent and cruel these are only passing disturbances of his emotional life mostly provoked and perhaps only the consequence of the ill adapted social system which he has so far made for himself

Unfortunately the testimony of history and our own experience do not bear this out but rather confirm the judgment that the belief in the *goodness* of man s nature is one of those unfortunate illusions from which mankind expects some kind of beautifying or amelioration of their lot but which in reality bring only disaster We need not proceed with this polemic for it is not on account of the teaching of history and of our own experience of life that we maintain the hypothesis of a special *instinct of a ression and destructiveness in* man but on account of general considerations to which we were led in trying to estimate the importance of the phenomena of *sadism* and *masochism* You know that we use the word *sadism* when sexual satisfaction depends upon the sexual object suffering pain ill treatment and humiliation and the word *masochism* when the subject himself has to suffer such treatment You know too that there is a certain admixture of these two tendencies in normal sexual relations and that we call them *perversions* when they thrust the other sexual aims into the background and substitute their own aims for them It can hardly have escaped you that sadism has a close connection with masculinity and masochism with femininity as if there were some secret relationship between them I must tell you at once that we have made no further progress along this path Both of them sadism and masochism are very hard to account for by the theory of the libido and especially masochism and it is only right and proper that the stone which was an obstacle to the one theory should become the corner stone of the other

For we believe that in sadism and masochism we have tr [illegible]
of the tw [illegible]
siveness [illegible]
sis that [illegible]
the instu [illegible]
made up [illegible]
kinds of [illegible] ucts Naturally they are to be found mixed in the greatest variety of proportions To this mixture the erotic instincts will contribute the whole multiplicity of their sexual aims while the others will admit only of mitigation and graduation of their uniform tendency This hypothesis opens up a line of investi ation which may some day be of great importance for the understanding of pathological processes For fusions may be undone and such defusions of instincts may be expected to bring about the most serious consequences to adequate functioning But this point of view is still too new no one has so far attempted to make practical use of it

Let us return to the specific problem which is presented by masochism If we put its erotic components on one side for a moment it proves the existence of a tendency which has self destruction as its aim We have already stated that the ego (or rather as we should here say the id the whole personality) originally includes all the instinctual impulses if *this applies equally to the destructive instinct* it will follow that masochism is older than sadism and that sadism is the destructive instinct directed outwards thereby acquiring the character of ag ressiveness Varying quantities of the original destructive instinct may still remain inside the or anism it seems as though we could only perceive it under two conditions either when it is bound up with the erotic instincts so as to form masochism or when it is turned on to the external world (with a greater or lesser erotic addition) in the shape of aggressiveness We are now led to consider the important possibility of the a gression being unable to find satisfaction in the external world because it comes up against objective hindrances It may then perhaps turn back and increase the amount of self destructiveness within We shall see that this actually occurs and that it is an event of great importance It would seem that aggression when it is impeded entails serious injury and that we have to destroy other things and other people *in order* not to destroy ourselves in order to protect ourselves from the tendency to self destruction. A sad disclosure it will be agreed for the moralist

But the moralist will for a long time to come console himself with the improbability of our speculations It is indeed a strange instinct that is occupied with the destruction of its own organic home! It is true that the poets speak of thin s of this sort but poets are irresponsible bein s they enjoy the privilege of poetic licence But after all such ideas are not foreign to physiology where we find for instance the mucous membrane of the stomach d gestin itself But it must be admitted that our instinct of self destruction requires more con

one in the most convincing way by cases in which we see neurotic suffering vanish at the appearance of suffering of another kind I will give you an instance of this I once succeeded in freeing a middle aged spinster from a symptom complex that had condemned her to a miserable existence for about fifteen years and had quite prevented her from taking any part in life She felt that she was now restored to health and plunged into a whirl of activity in order to develop her talents which were by no means small and derive a little appreciation enjoyment and success from life before it was too late But all her attempts ended in its being made clear to her or in her seeing for herself that she was too old to effect anything in that direction Every time this happened the next step for her would have been a relapse into her illness but that she could no longer bring about instead of it an accident would always befall her which incapacitated her for some time and caused her suffering She would fall down and sprain her foot or injure her knee or else hurt her hand while she was doing something or other As soon as she saw how great a part she herself played in these apparently chance accidents she altered her technique as one might say Instead of accidents she contracted on the same occasions slight illnesses such as catarrhs sore throats influenzal conditions or rheumatic swellings until at last when she made up her mind to resign herself to inactivity the whole business came to an end

As to the origin of this unconscious need for punishment there can be I think no doubt It behaves like a part of the conscience like the prolongation of conscience into the unconscious and it must have the same origin as *conscience that is to say it will correspond to a piece of aggressiveness which has been internalized and taken over by the super ego If only the words were less incongruous we should* be ...

it ...

cal ...

whether *we ought to suppose that all aggressiveness that has turned back from the* external world is bound by the *super ego* and so used against the ego or whether a part of it carries on its silent sinister activity as a free destructive instinct in the ego and the id Probably there is a division of this kind but we know nothing further about it When first the super ego is set up there is no doubt that that function is endowed with that part of the child s aggressiveness against its parents for which it can find no discharge outwards on account of its love fixation and external difficulties and for this reason the severity of the super ego need not correspond to the severity of its upbringing It is quite likely that when on subsequent occasions aggressiveness is suppressed the instinct follows the path which was opened to it at that decisive period

People in whom this unconscious sense of guilt is dominant distinguish themselves under analytic treatment by exhibiting what is so unwelcome from the point of view of prognosis —a negative therapeutic reaction In the normal course of events if one gives a patient the solution of a symptom at least the temporary disappearance of that symptom should result with these patients on the contrary the effect is a momentary intensification of the *symptom and the suffering that accompanies it. It often needs only a word of praise of their behaviour durin the cure the utterance of a few words of hope as to the progress of the analysis to bring about an unmistakable aggravation of their condition* A non analyst would say that they were lacking in the will to recovery from the analytical point of view their behaviour will appear as an expression of an unconscious sense of guilt which favours illness with its attendant sufferings and handicaps The problems raised by the unconscious sense of guilt its relation to morality education criminality and delinquency is at the present moment the favourite field of investigation for psycho analysts *Here we have quite unexpectedly emerged into the open from the mental underworld I cannot take you any further* but I will detain you for a few moments before I stop with one further considera

must take care not to underestimate the influence of social conventions which also force women into passive situations. The whole thing is still very obscure. We must not overlook one particularly constant relation between femininity and instinctual life. The repression of their aggressiveness which is imposed upon women by their constitutions and by society favours the development of strong masochistic impulses, which have the effect of binding erotically the destructive tendencies which have been turned inwards. Masochism is, then, as they say, truly feminine. But when, as so often happens, you meet with masochism in men, what else can you do but say that these men display obvious feminine traits of character?

You are now prepared for the conclusion that psychology cannot solve the riddle of femininity. The solution must, I think, come from somewhere else, and it cannot come until we have learned in general how the differentiation of living creatures into two sexes came about. We know nothing whatever about the matter, and yet sexual differentiation is a most remarkable characteristic of organic life and one by which it is sharply cut off from inanimate nature. Meanwhile we shall find plenty to occupy ourselves with in the study of those human individuals who are characterized as manifestly or preponderantly feminine by the possession of female genitals. It is in harmony with the nature of psycho-analysis that it does not try to describe what women are—that would be a task which it could hardly perform—but investigates the way in which women develop out of children with their bisexual dispositions. We have learnt a certain amount about this recently, thanks to the fact that several excellent women analysts have begun to work on the problem. A special piquancy has been lent to the discussion of this subject by the question of the difference between the sexes, for whenever a comparison was made which seemed to be unfavourable to their sex, the ladies were able to express the suspicion that we, the men analysts, had never overcome certain deep-rooted prejudices against the feminine, and that consequently our investigations suffered from bias. On the other hand, on the basis of bisexuality we found it easy to avoid any impoliteness. We had only to say, "This does not apply to you. You are an exception in this respect, you are more masculine than feminine."

In approaching the study of the sexual development of women we start with two preconceptions: firstly, that, as in the case of men, the constitution will not adapt itself to its function without a struggle; and secondly, that the decisive changes will have been set in motion or completed before puberty. Both of these preconceptions turn out to be justified. Further, a comparison with what happens in the case of the boy shows us that the development of the little girl into a normal woman is more difficult and more complicated, for she has two additional tasks to perform to which there is nothing corresponding in the development of the man. Let us follow the parallel from the very beginning. Certainly the original material is different in the boy and the girl; it does not require psycho-analysis to find that out. The difference in the formation of their genital organs is accompanied by other bodily differences which are too familiar for me to need to mention them. In their instinctual disposition, as well, there are differences which foreshadow the later nature of the woman. The little girl is as a rule less aggressive, less defiant and less self-sufficient; she seems to have a greater need for affection to be shown her, and therefore to be more dependent and docile. The fact that she is more easily and more quickly taught to control her excretions is very probably only the result of this docility; urine and stool are, as we know, the first gifts that the child can offer to those who look after it, and control over them is the first concession which can be wrung from the instinctual life of the child. One gets the impression, too, that the little girl is more intelligent and more lively than the boy of the same age; she is more inclined to meet the external world half way, and at the same time she makes stronger object-cathexes. I do not know whether the view that she gets a start in development has been confirmed by more exact observation, but in any case it is quite clear that the little girl cannot be called intellectually backward. But these sexual differences are of no great importance; they can be outbalanced by individual variation. For the purposes we have immediately in view they may be left on one side.

Both sexes seem to pass through the early phases of libidinal development in the same way. One might have expected that already in the sadistic-anal phase we should find that the girl showed less aggressiveness, but this is not the case. Women analysts have found from the analysis of children's play that the aggressive impulses of little girls leave nothing to be desired as regards copiousness and violence

among you that is not to be expected for you are the riddle yourselves Male or female is the first differentiation that you make when you meet another human being and you are used to making that distinction with absolute cer tainty Anatomical science shares your certainty in one point but not much more Male is the male sexual secretion the spermatozoon and its carrier female is the egg and the organism that contains it In each sex organs have been formed which exclusively subserve the sexual functions they have probably been developed from the same basis into two different for mations In both sexes moreover the other organs the shape of the body and the tissues are influenced by sex (the so called secondary sexual characters) but this influence is irregular and varying in degree And then science tells you something that runs counter to your ex pectations and is probably calculated to con fuse your feelings It points out to you that parts of the male sexual apparatus are also to be found in the body of the female although in a rudimentary condition and vice versa Science sees in this phenomenon an indication of *bisexuality* as though the individual were neither man nor woman but both at the same time only rather more the one than the other It then expects you to make yourselves familiar with the idea that the proportions in which the masculine and the feminine mingle in an in dividual are subject to quite extraordinary variations And even thou h apart from very rare cases only one kind of sexual product—ova or seminal cells—is present in any one individual you will go wrong if you take this factor as being of decisive importance and you must conclude that what constitutes masculin ity or femininity is an unknown element which it is beyond the power of anatomy to grasp

Can psychology do any better? We are used to consider masculine and feminine as mental qualities as well and have also carried the notion of bi exuality over into mental life We speak of a human being whether male or fe male behaving in a masculine or a feminine way But you will at once observe that that is simply following the lead of anatomy and con vention You can give the concepts of masculine and feminine no new content The difference is not a psychological one when you say masculine you mean as a rule *act ve* and when you say feminine you mean *passive* Now it is quite true that there is such a cor relation The male sexual cell is active and mobile it seeks out the female one while the latter the ovum is stationary and waits pas sively This behaviour of the elementary organisms of sex is more or less a model of the behaviour of the individuals of each sex in sexual intercourse The male pursues the female for the purpose of sexual union seizes her and pushes his way into her But with that you have so far as psychology goes reduced the quality of masculinity to the factor of aggres siveness You will begin to doubt whether you have hit upon anything fundamental here when you consider that in many classes of animals the female is the stronger and more aggressive party and the male is only active in the sin le act of sexual intercourse That is the case for instance with spiders The functions of carin for the young too and of rearin them which seems to us so essentially feminine are not among animals always associated with the female sex In some species of animals quite high in the scale one finds that th

in the d

that t

in the one soon

notice how unsatisfactory it is to identify masculine behaviour with activity and feminine with passivity The mother is in every sense of the word active in her relations with her child it is just as true to say that she gives suck to the child as that she lets it suck her breasts The further you go from the sexual field in the narrower sense of the word the more apparent it becomes that the two ideas do not coincide Women can display great activity in a variety of directions while men cannot live to ether with their kind unless they develop a high de gree of passive pliability If you thereupon say that these facts precisely prove that men and women are psychologically bisexual I shall infer that you have decided to identify activity with masculinity and passivity with femininity But I advise you not to do that It seems to me to serve no good purpose and to give us no new information

One might make an attempt to characterize femininity psychologically by saying that it involves a preference for passive aims That is naturally not the same as passivity it may require a good deal of activity to achieve a passive end It may be that the part played by women in the sexual function lead them to incline towards passive behaviour

nfluence of her sexual life as a model is limited or far reaching But we

of a hostile aggressive nature. It often happens that the hostile wishes only become apparent after they have been turned into anxiety ideas. It is not always easy to point out the way in which these early sexual wishes are formulated. What is most clearly expressed is the desire to get the mother with child as well as the corresponding one to have a child by the mother; both belong to the phallic phase and seem sufficiently strange, though their existence is established beyond all doubt by analytic observation. The attraction of these investigations lies in the extraordinary facts which they bring to light. Thus, for instance, one discovers the fear of being murdered or poisoned, which may later on form the nucleus of a paranoic disorder, already present in this pre-oedipal stage and directed against the mother. Or take another case. You will remember that interesting episode in the history of analytical research which caused me so many painful hours. At the time when my main interest was directed on the discovery of infantile sexual traumas, almost all my female patients told me that they had been seduced by their fathers. Eventually I was forced to the conclusion that these stories were false, and thus I came to understand that hysterical symptoms spring from phantasies and not from real events. Only later was I able to recognize in this phantasy of seduction by the father the expression of the typical Oedipus complex in woman. And now we find in the early pre-oedipal history of girls the seduction phantasy again; but the seducer is invariably the mother. Here, however, the phantasy has a footing in reality; for it must in fact have been the mother who aroused (perhaps for the first time) pleasurable sensations in the child's genitals in the ordinary course of attending to its bodily needs.

I dare say that you are prepared to suspect that this description of the richness and strength of the sexual relations of the little girl to her mother is very much exaggerated. One has, after all, plenty of opportunity of watching little girls, and one notices nothing of the sort. But the objection cannot be sustained. One can see enough of such things in children if one understands how to observe them, and besides this you must consider how little the child is able to give preconscious expression to its sexual wishes, and how little it can communicate them. We are therefore acting entirely within our rights in studying the subsequent traces and consequences of this emotional field in persons in whom these developmental processes show a particularly clear or even exaggerated growth. Pathology, as you know, has always assisted us by isolation and exaggeration in making recognizable things which would normally remain hidden. And since our researches have been carried out on people who are by no means grossly abnormal, we may, I think, consider the results of them worthy of belief.

We will now turn our attention to the question of why this strong attachment of the girl to her mother comes to grief. We are aware that that is what usually happens to it; it is fated to give way to an attachment to her father. And here we stumble on a fact which points in the right direction. This step in development is not merely a question of a change of object. The turning away from the mother occurs in an atmosphere of antagonism; the attachment to the mother ends in hate. Such a hatred may be very marked and may persist throughout an entire lifetime; it may later on be carefully overcompensated; as a rule one part of it is overcome while another part persists. The outcome is naturally very strongly influenced by the actual events of later years. We will confine our interest to studying this hatred at the actual time at which the turn towards the father takes place, and to inquiring into its motives. We are then met by a long list of complaints and grievances levelled at the mother, which are intended to justify the antagonistic feelings of the child; they vary in validity and we shall examine them further. Many are obvious rationalizations, and we have yet to find the true source of the antagonism. I hope you will bear with me if on this occasion I conduct you through all the details of a psycho-analytical investigation.

The complaint against the mother that harks back furthest is that she has given the child too little milk, which is taken as indicating a lack of love. Now this complaint has a certain justification in the case of the human family. The mothers often have not enough nourishment for the child, and content themselves with nursing them for nine months, six or even less. Among primitive peoples children remain at the breast for as long as two or three years. The figure of the wet nurse as a rule merged in that of the mother; where this does not take place the complaint against the mother takes another form, namely that she sent the nurse, who was so ready to feed the child, away too soon. But whatever may have been the true state of affairs, it is impossible that the child's

With the onset of the phallic phase the difference between the sexes becomes much less important than their similarities. We are now obliged to recognize that the little girl is a little man. As we know, in the boy this phase is characterized by the fact that he has discovered how to obtain pleasurable sensations from his little penis and associates its state of excitation with his ideas about sexual intercourse. The little girl does the same with her even smaller clitoris. It seems as though with her all her masturbatory actions center round this penis equivalent, and that the actual female vagina is still undiscovered by both sexes. It is true that here and there reports have been made that tell us of early vaginal sensations as well, but it cannot be easy to discriminate between these and anal sensations or from sensations of the vaginal vestibule; in any case they cannot play a very important role. We may assume that in the phallic phase of the girl the clitoris is the dominant erotogenic zone. But it is not destined to remain so; with the change to femininity the clitoris must give up to the vagina its sensitivity, and with it its importance, either wholly or in part. This is one of the two tasks which have to be performed in the course of the woman's development; the more fortunate man has only to continue at the time of his sexual maturity what he has already practised during the period of early sexual expansion.

We shall return to the part played by the clitoris, but shall now pass on to the second task with which the girl's development is burdened. The first love object of the boy is his mother, and she remains as such in the formation of his Oedipus complex and ultimately throughout his whole life. For the little girl too her mother must be her first object (together with figures of nurses and other attendants that merge into hers); the first object cathexes indeed follow the lines of the satisfaction of the great and simple needs of life, and the circumstances in which the child is nursed are the same for both sexes. In the Oedipus situation, however, the father has become the little girl's love object, and it is from him that in the normal course of develop-m[illegible] her object, while the boy keeps both of them unchanged. The question then arises of how this comes about. In particular, how does the little girl pass from an attachment to her mother to an attachment to her father? or in other words, how does she pass from her masculine phase into the feminine phase which has been biologically marked out for her?

Now it would provide us with an ideally simple solution of the problem if we could assume that from a certain age onwards the elementary influence of heterosexual attraction makes itself felt and draws the little girl towards men, while the same principle allows the boy to keep to his mother. One could even assume further that in doing this children are following a hint given them by the sexual preferences of their parents. But things are not so convenient as this. We hardly know whether we can seriously believe in the mysterious and unanalysable force of which the poets sing so enthusiastically. Painstaking investigations have resulted in findings of quite a different kind, the material for which at all events was easily obtainable. You must know that the number of women who until late in life remain tenderly attached to father objects, or indeed to their real fathers, is very large. We have made the most surprising discoveries about these women who display intense and prolonged father fixations. We knew, of course, that there had been an earlier stage in which they were attached to their mother, but we did not know that it was so rich in content, that it persisted so long, and that it could leave behind it so many occasions for fixations and predispositions. During this time their father is no more than an irksome rival. In many cases the attachment to the mother lasts beyond the fourth year; almost everything that we find later in the father relation was already present in that attachment and has been subsequently transferred on to the father. In short, we gain the conviction that one cannot understand women unless one estimates this *pre-oedipal attachment to the mother* at its proper value.

Now we should very much like to know what the libidinal relations of the little girl to her mother are. The answer is that they are manifold. Since they pass through all the three phases of infantile sexuality, they take on the characteristics of each separate phase and express themselves by means of oral, sadistic-anal and phallic wishes. These wishes represent active as well as passive impulses; if one relates them to the differentiation of the sexes which comes about later (which one should avoid doing as far as possible), one can speak of them as masculine and feminine. They are, in addition, completely ambivalent—both of a tender and

ates her from the mother-object. If we do not find something which is specific for the girl and which is not present at all or not present in the same way in the case of the boy, we shall not have explained the ending of the girl's attachment to her mother.

I think that we have discovered this specific factor, and in a place where we might indeed have expected it, but in a surprising form. In a place where we might have expected it, I say, for it lies in the castration complex. The anatomical distinction between the sexes must, after all, leave its mark in mental life. It was a surprise, however, to discover from analyses that the girl holds her mother responsible for her lack of a penis, and never forgives her for that deficiency.

You will notice that we ascribe a castration-complex to the female sex as well as to the male. We have good grounds for doing so, but that complex has not the same content in girls as in boys. In the boy the castration-complex is formed after he has learnt from the sight of the female genitals that the sexual organ which he prizes so highly is not a necessary part of every human body. He remembers then the threats which he has brought on himself by his playing with his penis, he begins to believe in them, and thence forward he comes under the influence of castration-anxiety, which supplies the strongest motive force for his further development. The castration-complex in the girl, as well, is started by the sight of the genital organs of the other sex. She immediately notices the difference, and—it must be admitted—its significance. She feels herself at a great disadvantage, and often declares that she would like to have something like that too, and falls a victim to *penis-envy*, which leaves ineradicable traces on her development and character formation, and, even in the most favourable instances, is not overcome without a great expenditure of mental energy. That the girl recognizes the fact that she lacks a penis, does not mean that she accepts its absence lightly. On the contrary, she clings for a long time to the desire to get something like it, and believes in that possibility for an extraordinary number of years; and even at a time when her knowledge of reality has long since led her to abandon the fulfilment of this desire as being quite unattainable, analysis proves that it still persists in the unconscious, and retains a considerable charge of energy. The desire after all to obtain the penis for which she so much longs may even contribute to the motives that impel grown-up woman to come to analysis, and what she quite reasonably expects to get from analysis, such as the capacity to pursue an intellectual career, can often be recognized as a sublimated modification of this repressed wish.

One cannot very well doubt the importance of penis-envy. Perhaps you will regard the hypothesis that envy and jealousy play a greater part in the mental life of women than they do in that of men as an example of male unfairness. Not that I think that these characteristics are absent in men, or that they have no other origin in women except envy of the penis, but I am inclined to ascribe the greater amount of them to be found in women to this latter influence. Many analysts, however, *tend to* minimize the importance of this first wave of penis-envy in the phallic phase. They think that the signs one comes across of this attitude in women are in the main a secondary formation which has come about through regression on to the early infantile impulse in question on the occasion of some subsequent conflict. Now this is one of the general problems of depth psychology. In the case of many pathological—or merely unusual—instinctual attitudes, for example, with all sexual perversions, the question arises how much of their force is to be attributed to early infantile fixations and how much to the influence of later experiences and developments. It is almost always a question of complemental series, such as we have postulated when dealing with the aetiology of the neuroses. Both sets of factors share in the causation in a varying proportion, and less in the one set will be balanced by more in the other. The infantile factor in every case paves the way; it is not always the decisive force, though it often is. But with regard to the particular case of penis-envy, I should like to come down decidedly in favour of the preponderance of the infantile factor.

The discovery of her castration is a turning point in the life of the girl. Three lines of development diverge from it; one leads to sexual inhibition or to neurosis, the second to a modification of character in the sense of a masculinity complex, and the third to normal femininity. We have learnt a good deal, though not everything, about all three. The fundamental content of the first is that the little girl, who has hitherto lived a masculine life and has been able to obtain pleasure through the excitation of her clitoris and has connected this behaviour with the sexual wishes (often of an active character) which she has directed towards her mother

complaint can be as often justified as it is met with It looks far more as if the desire of the child for its first form of nourishment is altogether insatiable and as if it never got over the pain of losing the mother s breast I should not be at all surprised if an analysis of a member of a primitive race who must have sucked the mother s breast when he could already run and talk brought the same complaint to light It is probable too that the fear of poisoning is connected with *weaning* *Poison* is the nourishment that makes one ill Perhaps moreover the child traces his early illnesses back to this frustration It requires a good deal of intellectual training before we can believe in chance primitive and uneducated people and certainly children can give a reason for everything that happens Perhaps this reason was originally a motive (in the animistic sense) In many social strata even to this day no one can die without having been done to death by some one else preferably by the doctor And the regular reaction of a neurotic to the death of some one intimately connected with him is to accuse himself of being the cause of the death

The next accusation against the mother flares up when the next child makes its appearance in the nursery If possible this complaint retains the connection with oral frustration the mother could not or would not give the child any more milk because she needed the nourishment for the new arrival In cases where the two children were born so close to ether that lactation was interfered with by the second pregnancy this complaint has a real foundation It is a remarkable fact that even when the difference between the children s ages is only eleven months the older one is nevertheless able to take in the state of affairs But it is not only the milk that the child grudges the undesired interloper and rival but all the other evidences of motherly care It feels that it has been dethroned robbed and had its rights invaded and so it directs a feeling of jealous hatred a ainst its little brother or sister and develops resentment against its faithless mother which often finds expression in a change for the worse in its behaviour It begins to be naughty irritable intractable and unlearns the control which it has acquired over its excretions All this has been known for a long time and is accepted as self evident but we seldom form a right idea of the strength of these jealou impulses of the tenacious hold they have on the child and the amount of influence they exert on its later development These jealous feelings are particularly important because they are always being fed anew during the later years of childhood and the whole shattering experience is repeated with the arrival of every new brother or sister Even if the child remains its mother s favourite things are not very different its demand for affection are boundless it requires exclusive attention and will allow no sharing whatever

A potent source of the child s antagonism against its mother is found in its many sexual wishes which change with its libidinal phases. These cannot for the most part be satisfied The strongest of these frustrations occurs in the phallic stage when the mother forbids pleasurable activities centring round the genital organs—often with an accompaniment of harsh threats and every indication of disapproval—activities to which after all she herself stimulated the child It might be thought that we had here motives enough for the little girl s alienation from her mother In that case it might be our view that estrangement follows inevitably from the nature of infantile sexuality from the child s unlimited demands for love and the unfulfillable nature of its sexual wishes One might even believe that this first love relation of the child is doomed to extinction for the very reason that it is the first for these early object cathexes are always ambivalent to a very high degree alongside the child s intense love there is always a strong aggressive tendency present and the more passionately the child loves an object the more sensitive it will be to disappointments and frustrations coming from it In the end the love is bound to capitulate to the accumulated hostility Or on the other hand one might reject the idea of a fundamental ambivalence of this kind in the libidinal cathexes and point to the fact that it is the peculiar nature of the mother child relationship which leads equally inevitably to the disturbance of the child s love since even the mildest form of education cannot avoid using compulsion and introducin restrictions and every such encroachment on its freedom must call forth as a reaction in the child a tendency to rebellion and aggressiveness A discussion of these possibilities might I think, be very interesting but at this point an objection suddenly arises which forces our attention in another direction All of these factors—slights disappointments in love jealousy and seduction followed by prohibition—operate as well in the relationship between the boy and his mother and yet are not sufficient to alien

boy who b rs the longed fo penis wi h him In the dea of ha ing a child by the father the accent is f en enough placed o the child a d to on the father Thus the old masculine wish for t po ses on of a penis still shows und r t comp et l d veloped fem inity But per haps we should rather think of th s des re for a penis s omethin es entially femini e in itself

W h the transference of the child penis wish on to h r father the girl enters into the s tua tion f the Oedipus-complex. The girl remains in the Oedipus situati f an indefinit period h only band ns t late in lif and then incomplet ly Th f rmat on f the super-eg must suffe in thes ci cum st ces it cannot ttain th stre gth d in dependen which gi t ts cultural impo tance and feminists re t pl ased f e points to the way in which this f ct ff cts the de elopment of the a erage fem nine character

Let us now go back a little We ha e men tioned as the second po sible react o *after* the d covery of femal castrat on the devel opment of a strong mascul nit c mplex What is me t b this th t the g rl refu es as it were to accept the unpalatab e fact a d by an outburst of d ance exaggerates st ll f rther the ma cul ty wh ch he has d pla ed h th erto She cl s to her cl oritic acti it es a d takes refuge in an identificat on e ther wi h the phallic mother or w h th father What is the determina t wh ch le ds to this tate of affa rs? We can p cture it as nothing other than a co t tutional factor the pos ess on of a gre ter degre of ct t su h as is usuall charac er s tic of the male The essential th g about the p ocess is after all that at th s poi t of devel opment the onset of p ss t wh ch m kes pos ble the cha ge over to fem nin ty is a o ded The most extreme ach e ement of th ma culin ty complex seems to occur w en it influences the girl s ob ect-cho ce in the direc tion of manifest homosexuality Anal tic ex perience teaches us, it is true that fem le homosexuality is eldom or never a d rect con tinuat on f infantil masculin t It seems t be chara terist c of female h mosexual that they too take the father as love-object for a whil d thus become implicated i the Oed pus situation. Then however they re d en by the ine t b e disappointments which they experienc from th f ther int a re re sion to th r early ma culinity complex. On must not overestimate the importa ce of these disap poi tment girls wh eventuall achie e fem ninit al o experience them w thou the m results Th prepond rance of th con t tional f ctor eems undeniable b t th t o phases in the dev lopment of femal homose uality are dmirably reflected in the beha i ur of homosexuals, who j st as often and just as b n usly play the parts of m ther and child toward e h o her as those f man d w f

What I have been telling you s what on might call the pre-hi tory of wom n. It s n ach evement of th last few years and you may ha e been interested in t as an example f d tailed w k in an l sis S nce women are our theme I am going to permit mys lf to mention by n m a few women to whom this in est gat on wes important c trib t s Dr Ruth Ma k Brunswick wa the first t describe cas f n rosis which went back t fixat on in the pre-oed pal state and in wh ch the Oedi

finds her enjoyment of phallic sexuality spoilt by the influence of penis envy She is wounded in her self love by the unfavourable comparison with the boy who is so much better equipped and therefore gives up the masturbatory satisfaction which she obtained from her clitoris repudiates her love towards her mother and at the same time often represses a good deal of her sexual impulses in general No doubt this turning away from her mother does not come to pass at one blow for at first the girl looks on her castration as a personal misfortune and only gradually extends it to other females and eventually to her mother Her love had as its object the phallic mother with the discovery that the mother is castrated it becomes possible to drop her as a love object so that the incentives to hostility which have been so long accumulating get the upper hand This means therefore that as a result of the discovery of the absence of a penis women are as much depreciated in the eyes of the girl as in the eyes of the boy and later perhaps of the man

You all know what an overwhelming aetiological importance is attributed by neurotics to their masturbatory practices They make them responsible for all their troubles and we have the greatest difficulty in getting them to believe that they are wrong But as a matter of fact we ought to admit that they are in the right for masturbation is the executive agent of infantile sexuality from the faulty development of which they are suffering The difference is that what the neurotics are blaming is the masturbation of the pubertal stage the infantile masturbation which is the one that really matters has for the most part been forgotten by them *I wish I could find an opportunity for* giving you a circumstantial account of how important all the factual details of early masturbation are in determining the subsequent neurosis or character of the individual concerned—such details as whether it was discovered or not how the parents combated it or whether they permitted it and whether the subject succeeded in suppressing it himself All these details will have left indelible traces upon his development But in fact I am relieved that it is not necessary for me to do this it would be a difficult and weary task and at the end you would embarrass me because you would quite certainly ask for some practical advice as to how one should behave towards the masturbation of small children as a parent or educator The history of the development of girls which is the subject I am telling you about offers an instance of the child itself striving to free itself from masturbation But it does not always succeed Where penis envy has aroused a strong impulse against clitoric masturbation but where the latter will not give way there follows a fierce battle for freedom in which the girl herself takes over as it were the role of the mother whom she has set aside and expresses her whole dissatisfaction with the inferior clitoris by striving against the *gratification derived from it Many years later* when her masturbatory activity has long ago been suppressed we may find an interest persisting which we must interpret as a defence against the temptation which she still fears It finds expression in feelings of sympathy for persons to whom she ascribes similar difficulties it may enter into her motives for marriage and may indeed determine her choice of a husband or lover The settling of the problem of infantile masturbation is truly no easy or unimportant task

When the little girl gives up clitoric masturbation she surrenders a certain amount of activity Her passive side has now the upper hand and in turning to her father she is assisted in the main by passive instinctual impulses You will see that a step in development such as this one which gets rid of phallic activity must smooth the path for femininity If in the process not too much is lost through repression this femininity may prove normal The wish with which the girl turns to her father is no doubt ultimately the wish for the penis which her mother has refused her and which she now expects from her father The feminine situation is however only established when the wish for *the penis is replaced by the wish for a child—* the child taking the place of the penis in accordance with the old symbolic equation It does not escape us that at an earlier stage *the* girl has already desired a child before the phallic phase was interfered with that was the meaning of her playing with dolls But this play was not really an expression of her femininity it served in identifying her with her mother for the purpose of substituting activity for passivity She was the mother and the doll was herself now she could do everything to the doll that her mother used to do with her Only with the onset of the desire for a penis does the doll child become a child by the father and thence forward the strongest feminine wish Her happiness is great indeed when this desire for a child one day finds a real fulfilment but especially is this so if the child is a little

boy who bears the longed-for penis with him. In the idea of having a child by the father the accent is often enough placed on the child, and not on the father. Thus the old masculine wish for the possession of a penis still shows through the completed development of femininity. But perhaps we should rather think of this desire for a penis as something eminently feminine in itself.

With the transference of the child-penis wish on to her father, the girl enters into the situation of the Oedipus-complex. The hostility against her mother, which did not require to be newly created, now receives a great re-inforcement, for her mother becomes a rival, who gets everything from her father that she herself wants. The girl's Oedipus-complex has long concealed from us the pre-oedipal attachment to her mother which is so important and which leaves behind it such lasting fixations. For the girl, the Oedipus situation is the conclusion of a long and difficult period of development; it is a kind of temporary solution of her problem, a state of equilibrium which is not lightly to be given up, especially as the onset of the latency period is not far off. And here we notice a difference between the two sexes in the relation between the Oedipus-complex and the castration-complex, a difference which is probably a momentous one. The boy's Oedipus-complex, in which he desires his mother, and wants to get rid of his father as a rival, develops naturally out of the phase of phallic sexuality. The threat of castration, however, forces him to give up this attitude. Under the influence of the danger of losing his penis, he abandons his Oedipus-complex; it is repressed and in the most normal cases entirely destroyed, while a severe super-ego is set up as its heir. What happens in the case of the girl is almost the opposite. The castration-complex prepares the way for the Oedipus-complex instead of destroying it; under the influence of her penis-envy the girl is driven from her attachment to her mother and enters the Oedipus situation, as though it were into a haven of refuge. When the fear of castration disappears, the primary motive is removed, which has forced the boy to overcome his Oedipus-complex. The girl remains in the Oedipus situation for an indefinite period, she only abandons it late in life, and then incompletely. The formation of the super-ego must suffer in these circumstances; it cannot attain the strength and independence which give it its cultural importance, and feminists are not pleased if one points out the ways in which this factor affects the development of the average feminine character.

Let us now go back a little. We have mentioned as the second possible reaction after the discovery of female castration the development of a strong masculinity complex. What is meant by this is that the girl refuses, as it were, to accept the unpalatable fact, and, in an outburst of defiance, even exaggerates still further the masculinity which she has displayed hitherto. She clings to her clitoritic activities, and takes refuge in an identification either with the phallic mother or with the father. What is the determinant which leads to this state of affairs? We can picture it as nothing other than a constitutional factor: the possession of a greater degree of activity, such as is usually characteristic of the male. The essential thing about the process is, after all, that at this point of development the onset of passivity, which makes possible the change over to femininity, is avoided. The most extreme achievement of this masculinity complex seems to occur when it influences the girl's object-choice in the direction of manifest homosexuality. Analytic experience teaches us, it is true, that female homosexuality is seldom or never a direct continuation of infantile masculinity. It seems to be characteristic of female homosexuals that they too take the father as love-object for a while and thus become implicated in the Oedipus situation. Then, however, they are driven by the inevitable disappointments which they experience from their father into a regression to their early masculinity complex. One must not overestimate the importance of these disappointments; girls who eventually achieve femininity also experience them without the same result. The preponderance of the constitutional factor seems undeniable, but the two phases in the development of female homosexuality are admirably reflected in the behaviour of homosexuals, who just as often and just as obviously play the parts of mother and child towards each other as those of man and wife.

What I have been telling you is what one might call the pre-history of women. It is an achievement of the last few years, and you may have been interested in it as an example of detailed work in analysis. Since women are our theme, I am going to permit myself to mention by name a few women to whom this investigation owes important contributions. Dr. Ruth Mack Brunswick was the first to describe a case of neurosis which went back to a fixation in the pre-oedipal stage, and in which the Oed-

pus situation was not reached at all It took the form of paranoia with delusions of jeal ousy and proved accessible to treatment Dr Jeanne Lampl de Groot has from her own un equivocal observations established the fact of the girl s phallic activities towards her mother which seem so hard to believe Dr Helene Deutsch has shown that the erotic behaviour of homosexual woman reproduces the mother child relationship

It is not my intention to trace the further course of femininity through puberty up to the time of maturity Our views on the subject are indeed not complete enough for me to do so In what follows I will merely mention a few separate points Bearing in mind the early history of femininity I will emphasize the fact that its development remains open to disturb ance from the traces left behind by the previ ous masculine period Regressions to fixations at these pre oedipal phases occur very often in many women we actually find a repeated alternation of periods in which either ma cu linity or femininity has obtained the upper hand What we men call the enigma of wom an is probably based in part upon these signs of bisexuality in female life But another ques tion seems to have become ripe for discussion in the course of these investigations We have called the motor force of sexual life *libido* This sexual life is dominated by the polarity mascu line feminine one is therefore tempted to con sider the relation of the libido to this polarity It would not be surprising if it turned out that each form of sexuality had its own special form of libido so that one kind of libido pursued the aims of the masculine sexual life and the other those of the feminine Nothing of the sort however is the case There is only one libido which is as much in the service of the male as of the female sexual function To it itself we can assign no sex if in accordance with the conventional analogy between activity and masculinity we choose to call it masculine we must not forget that it also includes impulses with passive aims Nevertheless the phrase *feminine libido* cannot possibly be justified It is our impression that more violence is done to the libido when it is forced into the service of the female function and that—to speak tele ologically—Nature has paid less careful atten tion to the demands of the female function than to those of masculinity And—again speaking teleologically—this may be based on the fact that the achievement of the biological aim is entrusted to the aggressiveness of the male and is to some extent independent of the co operation of the female

The sexual frigidity of women the frequency of which seems to confirm this last point is still a phenomenon which is insufficiently un derstood Sometimes it is psycho enic and if so it is accessible to influence but in other cases one is led to assume that it is constitu tionally conditioned or even partly caused by an anatomical factor

I have promised to put before you a few more of the mental characteristics of mature femininity as we find them in our analytical observation We do not claim for these asser tions more than that they are true on the whole and it is not always easy to distinguish between what is due to the influence of the sexual function and what to social trainin We attribute to women a greater amount of narcis si m (and this influences their object choice) so that for them to be loved is a stronger need than to love Their vanity is partly a further effect of penis envy for they are driven to rate their physical charms more highly as a belated compensation for their original sexual inferior ity Modesty which is regarded as a feminine characteristic *par excellence* but is far more a matter of convention than one would think was in our opinion originally designed to hide the deficiency in her genitals We do not forget that later on it takes over other functions People say that women contributed but little to the discoveries and inventions of civiliza tion but perhaps after all they did discover one technical process that of plaiting and weaving If this is so one is tempted to guess at the unconscious motive at the back of this achievement Nature herself might be regarded as having provided a model for imitation by causing pubic hair to grow at the period of sexual maturity so as to veil the genitals The step that remained to be taken was to attach the hairs permanently to ether whereas in the body they are fixed in the skin and only tan gled with one another If you repudiate this idea as being fantastic and accuse me of having an *idée fixe* on the subject of the influence exercised by the lack of a penis upon the devel opment of femininity I cannot of course de fend myself

It is not my intention to trace the further course of femininity throu h puberty up to the time of maturity Our views on the subject are indeed not complete enough for me to do so In what follows I will merely mention a few separate points Bearing in mind the early history of femininity I will emphasize the fact that its development remains open to disturbance from the traces left behind by the previous masculine period Regressions to fixations at these pre oedipal phases occur very often in many women we actually find a repeated alternation of periods in which either masculinity or femininity has obtained the upper hand What we men call the enigma of woman is probably based in part upon these signs of bisexuality in female life But another question seems to have become ripe for discussion in the course of these investigations We have called the motor force of sexual life *libido* This sexual life is dominated by the polarity masculine feminine one is therefore tempted to consider the relation of the libido to this polarity It would not be surprising if it turned out that each form of sexuality had its own special form of libido so that one kind of libido pursued the aims of the masculine sexual life and the other those of the feminine Nothing of the sort however is the case There is only one libido which is as much in the service of the male as of the female sexual function To it itself we can assign no sex if in accordance with the conventional analogy between activity and masculinity we choose to call it masculine we must not forget that it also includes impulses with passive aims Nevertheless the phrase *feminine libido* cannot possibly be justified It is our impression that more violence is done to the libido when it is forced into the service of the female function and that—to speak teleologically—Nature has paid less careful attention to the demands of the female function than to those of masculinity And—again speaking teleologically—this may be based on the fact that the achievement of the biological aim is entrusted to the aggressiveness of the male and is to some extent independent of the co operation of the female

The sexual frigidity of women the frequency of which seems to confirm this last point is still a phenomenon which is insufficiently understood Sometimes it is psychogenic and if so it is accessible to influence but in other cases one is led to assume that it is constitutionally conditioned or even partly caused by an anatomical factor

I have promised to put before you a few more of the mental characteristics of mature femininity as we find them in our analytical observation We do not claim for these assertions more than that they are true on the whole and it is not always easy to distinguish between what is due to the influence of the sexual function and what to social training We attribute to women a greater amount of narcissism (and this influences their object choice) so that for them to be loved is a stronger need than to love Their vanity is partly a further effect of penis envy for they are driven to rate their physical charms more highly as a belated compensation for their original sexual inferiority Modesty which is regarded as a feminine characteristic *par excellence* but is far more a matter of convention than one would think was in our opinion originally designed to hide the deficiency in her genital We do not forget that later on it takes over other functions People say that women contributed but little to the discoveries and inventions of civilization but perhaps after all they did discover one technical process that of plaiting and weaving If this is so one is tempted to guess at the unconscious motive at the back of this achievement Nature herself might be regarded as having provided a model for imitation by causing pubic hair to grow at the period of sexual maturity so as to veil the genitals The step that remained to be taken was to attach the hairs permanently to ether whereas in the body they are fixed in the skin and only tangled with one another If you repudiate this idea as being fantastic and accuse me of having an *idée fixe* on the subject of the influence exercised by the lack of a penis upon the development of femininity I cannot of course defend myself

The conditions of object choice in women are often enough made unrecognizable by social considerations Where that choice is allowed to manifest itself freely it often occurs according to the narcissistic ideal of the man whom the girl would have liked to be If the girl has

remained attached to her father (and that is to say, has remained in the Oedipus-complex), then she chooses according to the father type. Since, when she turned from her mother to her father, the antagonistic part of her ambivalent feelings remained directed on to her mother, such a choice should ensure a happy marriage. But very often a factor emerges which in general imperils such solutions of the ambivalence-conflict. The antagonism which has been left behind may follow in the wake of the positive attachment, and extend to the new object. The husband, who had in the first instance inherited his position from the father, comes in the course of time to inherit the position of the mother as well. In this way it may easily occur that the second part of a woman's life is taken up with a struggle against her husband, just as the shorter earlier part was occupied with rebellion against her mother. After this reaction has been lived out, a second marriage may easily turn out far more satisfactorily. Another change in a woman's nature, for which neither husband nor wife are prepared, may come about after the first child has been born. Under the influence of her own motherhood, her identification with her mother may be revived (an identification against which she has struggled up to the time of her marriage) and may attract to itself all the libido that she has at her disposal, so that the repetition-compulsion may reproduce an unhappy marriage of the parents. That the old factor of lack of penis has not even yet forfeited its power is seen in the different reactions of the mother according to whether the child born is a son or a daughter. The only thing that brings a mother undiluted satisfaction is her relation to a son; it is quite the most complete relationship between human beings, and the one that is the most free from ambivalence. The mother can transfer to her son all the ambition which she has had to suppress in herself, and she can hope to get from him the satisfaction of all that has remained to her of her masculinity complex. Even marriage is not firmly assured until the woman has succeeded in making her husband into her child and in acting the part of a mother towards him.

The mother-identification of the woman can be seen to have two levels: the pre-oedipal, which is based on the tender attachment to the mother and which takes her as a model, and the later one, derived from the Oedipus-complex, which tries to get rid of the mother and replace her in her relationship with the father. Much of both remain over for the future. One is really justified in saying that neither is overcome to an adequate extent during the process of development. But the phase of tender pre-oedipal attachment is the decisive one; it paves the way for her acquisition of those characteristics which will later enable her to play her part in the sexual function adequately and carry out her inestimable social activities. In this identification, too, she acquires that attractiveness for the man which kindles his oedipal attachment to his mother into love. Only what happens so often is that it is not he himself who gets what he wanted, but his son. One forms the impression that the love of man and the love of woman are separated by a psychological phase-difference.

It must be admitted that women have but little sense of justice, and this is no doubt connected with the preponderance of envy in their mental life; for the demands of justice are a modification of envy; they lay down the conditions under which one is willing to part with it. We say also of women that their social interests are weaker than those of men, and that their capacity for the sublimation of their instincts is less. The former is no doubt derived from the unsocial character which undoubtedly attaches to all sexual relationships. Lovers find complete satisfaction in each other, and even the family resists absorption into wider organizations. The capacity for sublimation is subject to the greatest individual variations. In spite of this I cannot refrain from mentioning an impression which one receives over and over again in analytic work. A man of about thirty seems a youthful and, in a sense, an incompletely developed individual, of whom we expect that he will be able to make good use of the possibilities of development which analysis lays open to him. But a woman of about the same age frequently staggers us by her psychological rigidity and unchangeability. Her libido has taken up its final positions, and seems powerless to leave them for others. There are no paths open to her for further development; it is as though the whole process had been gone through and remained inaccessible to influence for the future; as though, in fact, the difficult development which leads to femininity had exhausted all the possibilities of the individual. As therapeutists we deplore this state of affairs, even when we are successful in removing her sufferings by solving her neurotic conflict.

That is all I had to say to you about the

psychology of women It is admittedly incomplete and fragmentary and sometimes it does not sound altogether flattering You must not forget however that we have only described women in so far as their natures are determined by their sexual function The influence of this factor is of course very far reaching but we must remember that an individual woman may be a human being apart from this If you want to know more about femininity you must interrogate your own experience or turn to the poets or else wait until science can give you more profound and more coherent information

LECTURE 34

EXPLANATIONS APPLICATIONS AND ORIENTATIONS

LADIES AND GENTLEMEN May I for once tired as one might say of dry topics speak to you about matters which have very little theoretical importance, but which will be of interest to you in so far as you are friendlily disposed towards psycho analysis? Let us suppose that in a moment of idleness you take up a German or American or English novel in which you expect to find a description of men and conditions as they are today After reading a few pages you come upon the first mention of psycho analysis and then soon after upon another even though the context does not seem to require it. You must not imagine that this has anything to do with the application of *depth psychology* with a view to a better understanding of the characters in the book or of their behaviour (though of course there are quite serious literary works in which this is attempted) No such references are for the most part contemptuous remarks by means of which the author seeks to display his wide reading or his intellectual superiority And you will not always get the impression that he really knows what he is talking about Or again you may go for your recreation to some social gathering it need not necessarily be in Vienna After a short time the conversation will turn on psycho analysis and you will hear a great variety of people giving their opinion upon it usually in tones of dogmatic certainty This judgment is nearly always a derogatory one often abusive and at the very least derisive If you are so imprudent as to disclose the fact that you know something about the subject every one rushes up to you and asks for information and explanations until after a little time you are convinced that all these severe judgments had been made in the absence of any knowledge that hardly any of these adversaries have ever had a book about analysis in their hands or if they have that they have never been able to overcome the first resistance which people experience on coming in contact with a new subject

You may perhaps expect that an introduction to psycho analysis should give you some indication of what arguments you should use in order to correct these vulgar errors about analysis what books to recommend for those who want more knowledge or even what examples from your reading and experience you should bring into the discussion in order to alter the attitude of your interlocutors I beg you to do nothing of the sort It would be quite useless and your wisest course would be to hide your better knowledge altogether If that is impossible then restrict yourselves to saying that so far as you know psycho analysis is a special branch of science that it is exceedingly difficult to understand and to judge that it is concerned with very serious matters so that one cannot pass it off with a few jokes and that it would be better to choose some other topic as a social pastime Of course you will not take part in any attempts at interpretation if imprudent people repeat their dreams and you will resist the temptation to curry favour for analysis by giving accounts of cures that it has brought about

You may however raise the question why these people whether they write books or make conversation should behave so badly and you will incline to the view that the cause does not lie entirely with the people themselves but with psycho analysis as well That is my opinion too what you meet with in literature and conversation in the shape of prejudice is the after effect of an earlier judgment the judgment namely which the representatives of official science have passed upon the young science of psycho analysis I have already complained about it once before in a historical survey of the subject and I shall not do so again—perhaps even that was once too often but indeed there was no logical blunder no offence against decency and good taste which the scientific opponents of psycho analysis did not permit themselves in those days It was a situation such as actually occurred in the middle ages in which a wrong doer or even a mere political opponent was put in the pillory and exposed to the ill treatment of the mob And perhaps you do not fully realize how high up in our

scow the mob spirit extend and to what lengths peop will go when they feel that they are a part of a crowd and superior to personal responsibility At the beginning of those times I lived more or less alone, and I very soon saw that polemics would do no good, and that com plaints and appeals to worthier minds were useless, since there were no courts before which one could plead one s cause That being so I took another path I made use of applied psycho-analysis for the first time by explaining the behaviour of the crowd as an expression of the same resistance which I had to struggle against in my individual patients I kept off all polemics and influenced my followers as they gradually gathered, to do the same This mode behaviour was satisfactory The ban under which analysis was placed in those days has since been lifted but it has a belief which has been given up Enemies on as a superstition yet a theory which science has abandoned is preserved as a popular belief so today the original communication of psycho-analysis in scientific circles survives in the mocking contempt of the writers and conversationalists You will therefore no longer be surprised at this behaviour

You must not however expect the good news that the struggle is at an end, with the recognition of analysis as a science and as d recognition as a subject for university study There is no question of that the battle is still going on but more peaceful way There is moreover a new factor and that is that in the scientific world a kind of buffer has been formed between analysis and its opponents consisting of people who will allow that there is something in analysis (and even believe n it, subject to the most diverting reservations) but who on the other hand reject other parts of it they are eager to let everyone know What determines their choice is not easy to guess It seems to be a matter of personal sym pathies Some take objection to sexuality others to the unconscious the existence of symbolism seems to be particularly disliked. The circumstance that the structure of psycho-analysis, although unfinished, nevertheless already possesses a unified organization from which one cannot select elements according to one whim, seems not to enter the minds of these eclectics. When I consider these half quarter followers I never get the impression from any of them that their rejections are based on an examination of the material. There are a great many distinguished men who fall into this category They are certainly to be excused on the ground that their time and their interests are devoted to other things to those subjects in fact in the mastery of which they have achieved so much. But that being so would it not be better for them to reserve their judgements instead of taking sides so strongly? In the case of one of these great men I once succeeded in making a rapid conversion. He was a world famous critic who had followed contemporary trends of thought with benevolent understanding and prophetic vision. I only got to know him when he had already passed his eightieth year but he was still fascinating in conversation. You can easily guess to whom I am referring. And it was not I who raised the subject of psycho-analysis He began it by comparing himself in the most modest way with myself saying 'I am only a literary man and you are a man of science and a discoverer But there is one thing I should like to say to you I have never had any sexual feelings for my mother' But there was no need at all for you to have been conscious of it' was my reply such processes are unconscious in grown up people 'Oh so that's your idea' he said, greatly relieved and pressed my hand We went on talking for a few hours longer on the best of terms I heard later that during the few remaining years of his life he repeatedly expressed himself in friendly terms about analysis and liked to make use of what was for him a new word—*repression*

A well-known saying enjoins us to learn from our enemies I must own that I have never been able to manage it but it occurred to me that it might be instructive for you if I were to call up all the reproaches and objections which the opponents of psycho-analysis have levelled at it and then point out all the obvious misrepresentations and logical blunders which they contain. But on second thought I said to myself that it would not be at all interesting but wearisome and disagreeable and would, in fact be precisely what I have taken such pains to avoid all these years You will have to excuse me therefore if I refrain from following up this line of thought any further and spare you the judgements of our so-called scientific opponents After all we are here dealing almost exclusively with people whose sole claim to be heard rests on their impartiality — which they have preserved by keeping away from the facts of psycho-analysis. But I am aware that in other cases you will not let me get away so cheaply You will point out that,

after all there are a great many people to whom my last remark does not apply These people you will say have not kept away from analytical experience they have analysed patients they have perhaps even been analysed themselves they were actually my colleagues for some time and now they have come to other conclusions and formed other theories on the basis of which they have left me and have founded independent schools of psycho analysis You will expect me to give some explanation of the possibility and meaning of these dissenting movements which have occurred so frequently in the history of analysis

Very well then I will try but I shall only do it briefly for it throws less light on nature of
sure tha
Individ [illegible] gy which in America for example is looked on as being equal in importance to our psycho analysis and as running on p rallel lines and is constantly mentioned in the same breath with it In reality Individual Psychology has very little to do with analysis but for certain historical reasons lives a sort of parasitic existence at its expense The qualifications which we have predicated for this group of opponents only apply to the founders of Individual Psychology to a very limited extent The name itself is unsuitable and seems to be a product of embarrassment we cannot assent to any interference with its correct application as meaning the opposite of Group Psychology for the matter of that our own concern is first and foremost the psychology of the human individual I am not going into an objective criticism of Adler s Individual Psychology today for that is no part of my program in these lectures besides which I have already made such an attempt elsewhere and I have little occasion for altering what I there said I will however give you an illustration of the impression it makes by tellin you of a mall incident which occurred to me in my pre analytic years

In the neighbourhood of the little Moravian town in which I was born and which I left as a child of three years old there is a mode t health resort beautifully placed in a settin of green Durin my school years I often spent my holidays there Some twenty years later the illness of a near relative of mine afforded me an opportunity of seeing the place again In a conversation with the doctor in charge of the place who had attended my relative I enquired about his dealings with the—I believe—Slovakian peasants who were his only clientele during the winter He told me that his medical treatment was carried on in the following way In his consulting hours the patients came into his room and formed up in a line. One after another they came forward and told him their complaints One of them might have pains in the back or a stomach ache or a feeling of tiredne s in the legs etc The doctor then examined him and when he had formed his conclusions told him the diagnosis which was in every case the same He translated the word to me and what it amounted to was be witched I was astonished and asked whether the patients made no objection to his saying the same thing to all of his patients Oh no! he answered they are very much pleased it is exactly what they expect Each one as he goes back to his place in the line says to the others by his looks and gestures There s a fellow who knows what s what! At that time I little thou ht in what circumstances I should meet with an analogous situation

For whether a person is a homosexual or a necrophilist or an anxiety ridden hysteric or a shut in ob essional or a raving madman—in every case the Individual Psychologist of the Adlerian persuasion will assign as the motive force of his condition the fact that he wants to assert himself to over compensate for his inferiority to be on top and to move over from the feminine to the masculine line We u ed to hear exactly the same kind of thing when we were young students at the hospital Hysterics we were told produce their symptoms in order to make themselves interesting and to attract attention to themselves It is extraordinary how these old profunditie recur! But even at the time this little bit of psychology did not seem to us to cover the problem of hysteria it left unexplained for instance why people who suffer from it do not make u e of ome means for the attainment of their end Some element of this doctrine of the Individual Psycholog ts must of course be correct though they regard this fragmentary explanation as a complete one The instinct of elf preservation will attempt to turn every situation to its own account the ego will try to get some advantage even out of being ill In psycho analysis we call this the *secondary gain from illness* But indeed when one thinks of the facts of masochism of the unconscious need for punishment and of the neurotic tendency to self injury all of which seem to imply the existence of instinctual impulses which run counter to self preservation

ter comes to question even the general validity of the platitude on which the theoretical structure of Individual Psychology is built. But, to the mass of mankind a theory like this must be exceedingly welcome, which takes no complications into account, which introduces no new and difficult concepts, which knows nothing of the unconscious, which removes at a single blow the problem of sexuality that weighs so heavily on everybody and which confines itself to revealing the devices by means of which people try to make life comfortable. For the mass of mankind are themselves comfort-loving; they require only a single reason to serve as an explanation, they are not grateful to science for its intricacies and they like to have simple answers given to their questions and to feel that their problems are settled once and for all. Once one sees how closely Individual Psychology approximates to the fulfilment of these requirements, one cannot help remembering a couplet from *Wallenstein*:

If the thought were not so damned clever
One might be tempted just to call it stupid.

Specialist criticism, which has been so uncompromisingly opposed to psycho-analysis, has in general handled Individual Psychology with a velvet glove. It is indeed, true that in [illegible]

If that is so, he will also neglect the analysis of the patient's childhood and start on an altogether different technique, and he will have to make up for the absence of the effects of childhood analysis by increasing his own didactic influence and by directly recommending the adoption of certain aims in life. We, for our part, would then say: "That may be a philosophy, but it is no longer analysis." Or another analyst may come to hold the view that the anxiety-experience of birth is the root of all later neurotic disturbances; in that case he may think it proper to restrict analysis to the effects of this one experience and to promise therapeutic success after a three to four months' treatment. You will observe that I have chosen two examples which proceed from diametrically opposed premises. It is an almost universal characteristic of these *dissenting movements* that each of them seizes upon *one fragment* out of the wealth of motives found in psycho-analysis (such, for instance, as the instinct for the power, the ethical conflict, the mother, genitality, etc.) and on the basis of this appropriation *makes itself independent*. If it seems to you that such secessions are commoner today in the history of psycho-analysis than they are in any other movement of thought, I do not know whether I should agree with you. If it be so, we must attribute the responsibility to the close relationship between theory and practice which [illegible]

[illegible] of the Individual Psychologists. If others have behaved far more kindly, the opposition to analysis is largely responsible.

I need not say much about other schools that have split off from us. That such splits have occurred is no argument for or against the truth of psycho-analysis. You have only to think of the strong emotional factors which make it difficult for many people to co-operate with others or to adopt a subordinate position, and of the still greater difficulty which is embodied in the proverb: *Quot capita tot sensus*.* When the differences of opinion had gone beyond a certain limit the best thing to do was to part company and thenceforward to go different ways, especially if the theoretical difference involved an alteration in analytical technique. Let us take for example an analyst who thinks very little of the influence of the patient's past, and looks for the cause of neurosis exclusively in contemporary motives and expectations directed towards the future.

* As many interpretations as heads.—ED.

of intolerance. The only evidence of this disagreeable characteristic was precisely our separation from people who thought differently from ourselves. Apart from that we have taken no steps against them; on the contrary, they are now in clover, they are far better off than before, because in parting company with us they have in most cases got rid of one of the burdens under which we groan—the odium of infantile sexuality, for instance, or the ludicrousness of symbolism—and they are now regarded by the world at large as, at all events, semi-respectable, which we who remain behind cannot even yet claim to be. It was they themselves, moreover, who—excepting for one noteworthy example—effected the separation.

And what more do you ask of us in the name of tolerance? When any one has expressed an opinion that we hold to be fundamentally false, do you wish us to speak to him like this?

Thank you so much for contradicting us You have saved us from the danger of self complacency and have given us an opportunity of proving to the Americans that we really are as broadminded as they could possibly wish We do not believe a word of what you say but that does not matter You are just as right as we are in all probability After all who can ever know who is in the right? In spite of our disagreement you must allow us to put forward your views in our publications And we hope that you on your part will be so kind as to support ours although you disbelieve in them This will obviously be the usage of the future in scientific circles when the misapplication of Einstein s theory of relativity has completely won the day It is true that for the moment we have not gone quite so far as that We have confined ourselves in the old fashioned way to putting forward only our own convictions we expose ourselves to the danger of making mistakes for no one can avoid that and we reject anything that contradicts our views As to the right to change our opinions if we think we have found something better we have made full use of it in psycho analysis

One of the first applications of psycho analysis was that we were able to understand the opposition we had to meet on a

[illegible]

[illegible] first intention was as you know to understand the disturbances of the human mind because an astonishing experience had shown us that in this case understanding and cure go almost hand in hand and that a practicable path lead from the one to the other And for a long time this was our only intention Then however we came to recognize the close relationship in fact the underlying identity subsisting between pathological and so called normal processes So psycho analysis became *depth psychology* and since nothing that man makes or does can be understood without the aid of psychology the applications of psycho analysis to numerous fields of knowledge and especially to the mental sciences came about automatically forced themselves on our attention and demanded elaboration Unluckily the tasks which we now undertook brought us up against obstacles which lying as they do in the very nat [illegible]

[illegible] those who do possess the knowledge—the experts—do not know anything of analysis and perhaps do not want to know anything The result has been that analysts have entered the lists in such fields as those of mythology the history of civilization ethnology the science of religion etc as amateurs with a more or less adequate equipment often collected in a hurry In those fields they were treated by the specialists who were established there as no better than interlopers and their methods as well as their findings in so far as they attracted any attention at all were to begin with rejected But the position is steadily improving in every field the number of people who study psycho analysis with a view to making use of it in their special researches is growing in the same way that colonists take the place of pioneers Here we may expect a rich harvest of new knowledge Applications of psycho analysis are always confirmations of it as well In regions where scientific work is more remote from practical activity the inevitable differences of opinion will be less embittered

I feel greatly tempted to take you through all the applications of psycho analysis in the field of mental science There are things which every one who has intellectual interests would think worth knowing and to hear no more for a time about abnormalities and illness would give us a well earned relief But I must resist the temptation it would once more take us too far outside the framework of these lectures and to tell you the truth I should not be competent to do it It is true that I took the first step along some of these lines but today I no longer command a view over the whole field and I should have to spend much time in study in order to grasp all that has been added since I made my first attempts Those of you who are disappointed by my refusal can make up for it by reading our journal *Imago* which is devoted to the non medical applications of analysis

There is one subject however that I cannot pass by so easily though this is not because I have any sp[illegible] done much [illegible]

[illegible] of all the activities of analysis I refer to the application of psycho-analysis to education to the up bringing of the next generation I am at least glad to be able to say that my daughter Anna Freud has made this her life work and is in this way making good my

gy neglect of the subj ct. One can e—l see the path that has led to this app' cation of anal ysis. When, during the treatment of an ad lt patient we tried to trace the d term nation of his symptoms w were al ays led back into h early childhood. A knowledge of the later etiological f ctors was ot sufficient either for our understandin of his condit on or to effect a cure. The result was that we were forced to acquaint oursel es wi h the psychological pe culiarities of the years of infa cy and we learned a great many things which could not have been discovered except through analysis and were in a pos tion to t right a number of generally accepted beli fs about childhood We came to see that the firs years of fancy (up t bout the age of fi e) are for a number of reasons f special importance This is in the first place because they contain the first expansion of sexuality which lea es behind decisive determinants for the sexual lif of maturity and in the second place because the impressions of this period come up against an unformed and weak ego upo which they act like traumas Th ego cannot defend i lf against t emotional t rms which they call forth except by repres on, and in this way it acquires in childhood all its predispos tions to subsequent illnesses and disturban es of func tion. W have come to realize that th difficulty of childhood consists in th fact that the child h in a short span of time to m k ts own the acquisitions f cultural dev lopment which has extended ov tens f thousands f years it ha that is to ttain instinctual con trol and social adaptation, r at any rate their first elements It can onl a hieve part of this alteration through its own development a great deal must be forced upon t by ed ca tion. W are ot in th least urprised that the child f en performs its task onl incom plet ly A great many hildren in these early years pas through conditions which ma be compared with euroses and this is certainly true f all those wh develop a manifest illness later on. In ot few cases the neurot c ill ness does not wait till they re grown up but breaks out in childhood and is rc of great tro to parents and doctors

W have had hesitation in pplying ana lytic therapy t such children as eith display unambiguous neurotic symp oms ar on th way to an unf voura e character-development Th anxiety expressed by opponents f analy s that t child might be harmed by th process has turned out to be quite unf unded.

The advantage gained by this procedure is that we have been able to confirm in the living s b ject wh t we have only inferred as thou h from historical documents in the ca e of adults But the advantages gained by the chil dren themselves was most satisfactory It turned out that the child is a mo t fa ourable s bject for analytic therapy ucces es were rad cal and permanent Natural y one has to make exten e alterations in the techn que of tre tment whi h has been developed for ad lts when one s dealing with children The child is psycho ogically a d fferent thing from the adult it does not yet possess a super-ego it cannot make much use of the method of free a ociation and transference pla s a different part with i since its real parents re till there The internal resistances against wh ch we have to fight in the case of adul s are in the case of ch ldren f the most part replaced by ex ternal difficulties If the parents mak them selves in o vehicles for the resista ce th aims of th analysis and even the process of the analysis itself are often endangered. For this ... a cer

e

other hand the ine t ble dif rences between child anal sis d dult analy i are dimini hed by the f ct that many of our pat ents ha e till kep so many of the r infantil character tra ts that th nalyst once m re adapting himself t hi patient canno avoid making us of certain parts f the technique of child an lys in their ca e too It is in the nature f things that child nalysis hou d h ve be com the special field of women analysts and this will o doubt contin to be

Th ew that th maj rity of our children pass through a neurotic phase in the course of their devel pment automat cally raises a hy gienic question. It may be a ked whether it would not be d antageous t com to th a d of a child with nalysis even where there is no ign of a disturbance, as a precaut onary measure in the interests f its health just as now days on inoculates healthy children again diphtheria without waiting f r them to fall ill of th disea The di cussion of this question is today only a mat of academic int est, I ca venture t speak about it t you but the greater numbe of our c ntemporaries would rega d the mere idea othing hort of criminal, and when considers the tt ude f most parents t w rds analysis one must a yet, gi e up any hope f its realization. uch

a prophylactic against nervous disease which would probably be very effective presupposes an entirely different structure of society The application of psycho analysis to education must be looked for today in quite a different direction Let us get a clear idea of what the primary business of education is The child has to learn to control its instincts To grant it complete freedom o that it obeys all its impulses without any restriction is impossible It would be a very instructive experiment for child psychologists but it would make life im possible for the parents and would do serious damage to the children themselves as would be een partly at the time and partly during subsequent years The function of education therefore is to inhibit forbid and suppress and it has at all times carried out this function to admiration But we have learnt from analy sis that it is this very suppression of instincts that involves the danger of neurotic illness You will remember that we have gone into the question of how this comes about in some de tail Education has therefore to steer its way between the Scylla of giving the instincts free play and the Charybdis of frustrating them Unless the problem is alto ether insoluble an optimum of education must be discovered which will do the most good and the least harm It is a matter of finding out how much one may forbid at which times and by what methods And then it must further be consid ered that the children have very different con stitutional dispositions so that the same educa tional procedure cannot possibly be equally good for all children A moment s consideration will show us that so far education has fulfilled its function very badly and has done children serious injury If we can find an optimum of education which will carry out its task ideally then we may hope to abolish one of the factors in the aetiology of neurotic illness viz the influence of accidental infantile traumas The other factor the power of a refractory instinc tual constitution can never be got rid of by education When therefore one comes to think of the difficult tasks with which the educator is confronted when one reflects that he has to recognize the characteristic constitution of each child, to guess from small indications what is going on in its unformed mind to give him the right amount of love and at the same time to preserve an effective degree of authority then one cannot help saying to oneself that the only adequate preparation for the profession of educator is a good grounding in psycho anal ysis The best thing would be for him to be analysed himself for after all without per sonal experience one cannot get a grasp of analysis The analysis of teachers and educa tors seems to be a more practicable prophylac tic measure than the analysis of children them selves and there are not such great obstacles against putting it into practice

I will only mention in passing an indirect advantage which analysis may br[illegible] ed[illegible] t[illegible] t[illegible] u have experienced an anal ysis themselves and who have derived much benefit from it among other things an insight into the mistakes in their own upbringing will treat their children with better understanding and will spare them a great deal which they were not spared themselves Parallel with the efforts of the analyst to influence education run other investigations into the cause and prevention of delinquency and criminology Here again I shall only open the door and show you what lies behind it but I shall not take you inside If your interest in psycho analysis is main tained you will be able to learn a great deal that is both new and valuable on these subjects I cannot however leave the theme of educa tion without mentioning one particular point of view It has been said—and no doubt with justice—that every education is partisan it aims at making the child adapt itself to what ever social system is the established one with out consideration of how valuable or how stable that ystem may be If it is argued one is convinced of the shortcomings of our present day social arrangements one cannot think it right to give them the added support of this psycho analytical education of ours We must place before it another and a higher aim one which is emancipated from the social standard that are dominent today I do not feel how ever that this argument is valid It is demand ing more of analysis than its functions can ju tify The physician who is called in to treat a case of pneumonia has no need to consider whether the patient is a good man a suicide or a criminal whether he deserves to remain alive or whether it is for his advantage to do so This other aim which it is sought to place before education would be a partisan one as well and it is not the business of the analyst to decide between parties I am not now consider ing the fact that people will refuse to allow psycho analysis to have any influence at all on education if it confesses to aims which are in

compatible with the existi g soc al order Psy cho-anal tic education will be a suming an unwarranted re pons bil ty if t sets out to make ts pupils into revolutionaries It will have done its ta k if it sends them away as healh and as efficient s pos ble There are enough revo onary elements contained with in itself t ensure that no one br ught up under its influence will in late l fe be on the de of reaction and uppress on. I should go so far as to sa that revolutionary children are not desirable from any point of ew

Ladies and Gentlemen—I shall co clude by saying a few words on the therapeut c aspect t psycho-analysis I discussed the theo et cal side of th s bject fifteen years ago a d I cannot formulate it in an other way today but I will say s mething bo t the pract cal experience which we ha e had w th it dur g th interval. You know f course that p cho-analysis origin ted a a therapeut c procedure it has go e far beyond that but t has never given up ts rigin l fi ld of wo k and it st'll re es upo c nta t with l n cal m te al fo further advances and development. The ac mula on f emp rical data upon which w ba our theories can be obt ined in no other wa Our therapeutic failures a e co st tly setting us new ta ks and the requ ements of eal life re an efficient protection aga st carryin t excess the peculat n wh ch we nevertheless cannot a d in ur w k. I ha e alread in m f rm lect res gi en an ount of the mean by wh ch psycho-anal is h ps the patient and along what li es today we will c ns der to what exte t t ceeds

You re pe h ps aware that I h e ever been therape tic enthusiast and the s no danger f my using this an opportun ty for ..gin the pra es f n lys in this respect. I would rath say too littl than too m h At a t.m wh I wa t ll the only analyst peopl wh w e ppa e tly kindly d sposed to my opinions used to say t m Th t is ll ery ni and cleve but how me a ca that you h. e cured by analys Th w s on of the ma y f rmulas that u ceed d e an th as tim went whos fun tion t w t put the m on em t ov lty on s d Tod y t as out f d t ma y th rs the analyst, like a y othe th rape t t, has his ollecti n f letters f grat t d f om pat ts who ha e been cu ed. And th analo y does not end there Ps ho-analys eally is f rm of th py just a th m thods are It has ts tri umphs its defeats its d fficult es its l m ta tions and its ind cat ons There was a time when people attacked an l s s w th the accusation that it was n t to be taken seriou ly as a therapy because it d d not venture to publ sh any stat stics of its uccesses Si ce then the Inst tute of Ps cho-Analys s in Berlin wh ch was founded by Dr Max Eitingon has published a report of its work duri g the first ten years of its ex tence The proportion of reco eries which ha e been effected gi e us ground n ither for boasting nor for feel ng shamed But uch stat t cs are not instruct ve because th mater l with wh ch they deal s h terogeneous that it would need a very l rge number of cases to pro e a th ng It is better to examine o e s own i di idual experience. As to that I may say that I do not think our suc ces es ca compete with those of Lourdes There a e o m ny more people who believe in the m racles of the Blessed Virgin than i the ex tence of the unc n ci us But if we d s-regard supernatural competit on we must compare psycho-anal s s w th other methods of p ychotherapy Nowad ys one need hardly take into cons derat on orga ic ph s cal treatment of neu otic cond t ons As a psycho- d n

th ret al obj ct on t a ph s cian wh de

haracte of the ca e and the fa ourable or unf ourable n tu e of the c rcum t ces In a tual fact t is the que t on of techn que wh ch rend rs ec sary th specializat n of medical practice So for example t became c s ry to parat urgery and orth paedics

eading and t ke off when one w ts to g f a w lk. As a rule psy ho-analysis e the po ses es th d cto entir ly o not t ll The psycho-therapeutists who cas nally make use f analysi d ot as far as my experience goes sta d on a firm analytical basis they h ot a pted alys s s whole but h ve wat ed t d wn and pe haps remo ed ts ting they cann t be counted s a lyst In my opini th s is to be egretted b t a co-operatio in medi l practic between an analyst and a psycho-th rapeutist who limits him

self to other methods would be alto ether advantageous

Compared with other psycho therapeutic procedures psycho analysis is far and away the most powerful That is quite as it should be since it costs the most trouble and time and one would not make use of it for slight cases in suitable cases one can remove disturbances and bring about alterations which could not be hoped for in pre analytic times But it has also perfectly clearly felt limitations The thera peutic ambitions of many of my followers have led them to be at great pains to remove such hindrances so that all neurotic disturbances might be curable by means of psycho analysis They have attempted to compress the work of analysis into a shorter period to intensify the transference so that it should be superior to any resistance and to combine other methods of influence with analysis in order to obtain a cure These enterprises are no doubt praise worthy but in my opinion they are in vain They also involve the danger of oneself being drawn away from analysis and of drifting into a boundless sea of experimentation The expec tation that we shall be able to cure all neurotic symptoms is I suspect derived from the lay belief that neuroses are entirely superfluous things which have no right whatever to exist As a matter of fact they are serious constitu tionally determined affections which are sel dom restricted to a few outbreaks but make them elves felt as a rule over long periods of life or even throu hout its entire extent Our analytic experience that we can influence them to a far reaching degree if we can get hold of the historic l n -

cid[illegible]

the [illegible] i peutic practice And we are in fact powerless to deal with it but in our theory we ou ht always to bear it in mind In any case the complete in accessibility of the psycho es to analytic ther apy should in view of their close relationship to the neuroses moderate our optimism in regard to the latter The therapeutic efficiency of psycho analysis is limited by a whole series of important factors which can scarcely be dealt with at all With children where one might hope to have the greatest successes there are the external difficulties of the paren t l situation yet after all these are bound up with the very fact of being a child With adults we are primarily concerned with two f ctors the degree of their mental rigidity and the form of their disease with all the deeper seated determinants that lie behind it The for mer of these is often unjustifiably overlooked However great the plasticity of mental life may be and however great the possibility of reviving past states not everything can be brou ht to life again A great many alterations seem final and corre pond to scars left behind by processes which have run their course In other cases one gets an impression of a general rigidity of the whole mind mental processes which one could very well redirect into other channels seem incapable of leaving their old courses But perhaps this is the same as what we have said already but looked at from an other point of view Only too often one seems to ee that the therapeutic process is merely lacking in the necessary motive force to enable it to bring about the alteration Some specific tendency some particular instinctual compo nent is too strong in compari on with the counter forces that we can mobilize against it This is quite generally so in the case of the psychoses We understand them in so far as we know quite well where we ou ht to apply the levers but they are not able to lift the weight In this connection we may hope that in the future our knowled e of the action of hormones—you know of course what they are —will provide us with a means of coping suc cessfully with the quantitative factors involved in these diseases but today we are far from h ving reached that desirable goal I can under stand that the uncertainty prevailing in all these matters is a constant incentive toward perfecting the technique of analysis especially in the matter of the transference The beginner in analy is in particular will be in doubt when he is unsuccessful whether he ou ht to blame the peculiarity of the case or his own un kilful handling of the therapeutic procedure But as I have said already I do not think that there is much to be gained by directing one s energies along these channels

The other limitation to analytical successes is impo ed by the form of the disea e You know already that the field in which analytical ther apy can be applied is that of the transference neuroses phobias hysteria ob es ional neu ro es and besides these such abnormalities of character as have been developed instead of these di eases Everyth ng other than the e such as narcissistic or psychotic conditions is more or less un uitable Now it would be per fectly legitimate to save oneself from failures by carefully excluding such ca es If this pre caution were taken the statistics of analysis

would be very much improved. Yes, but this is not so easy as it seems. Our diagnoses can very often only be made *ex post facto*. They are like the test for witch finding applied by the Scottish king of which I have read in one of Victor Hugo's books. This king declared that he had an infallible method for detecting witches. He put them to simmer in a cauldron of boiling water and then tasted the soup. According to the taste he could say 'that was a witch,' or 'that was not a witch.' The same thing happens with us except that it is we who are the sufferers. We cannot give an opinion about a patient who comes for treatment, or a candidate for training, until we have studied him analytically for some weeks or months. We are, in fact, always buying a pig in a poke. The subject comes to us with undefined, general troubles which do not allow of any certain diagnosis. After a period of probation it may turn out that the case is an unsuitable one. Then if he is a candidate we send him away, or if he is a patient we keep him a little while to see whether we cannot take a more favourable view of him. The patient has his revenge by swelling our list of failures, and the rejected candidate, it may be (if he is paranoid), by writing psycho-analytical books himself. You will observe that our caution has not been of much value to us.

I am afraid these details will have gone beyond the scope of your interests. But I should be even more distressed if you were to think that I intend to diminish your respect for psycho-analysis as a therapeutic procedure. Perhaps I have really set about the business clumsily. I wanted, you see, to achieve the opposite: to excuse the therapeutic limitation of analysis by indicating how unavoidable they are. With the same object in view let me turn to another point, namely the complaint that analytic treatment takes up a disproportionately long time. The answer to that is that psychological changes only come about very slowly: if they occur quickly and suddenly, it is a bad sign. It is true that the treatment of a serious neurosis may easily last several years, but if a successful result is achieved, you must ask ourselves how long the illness itself would otherwise have lasted. It would probably have lasted a decade for every year of treatment, which means that the illness would never have passed off at all, as we often find in untreated cases. In many instances we have reasons for resuming an analysis after an interval of many years: new events in the patient's life have called out in him new pathological reactions, though in the meantime he has been perfectly healthy. The first analysis had not actually brought all his pathological dispositions to the surface, and it was natural that it should have been broken off as soon as it was successful. There are also people who are so seriously afflicted that they have to be kept under analytic care throughout their whole lives and taken back into analysis from time to time, but such people would otherwise be incapable of carrying on their lives at all, and one may be thankful that they can be kept going by means of this intermittent and recurrent treatment. The analysis of characterological disturbances too involves a length[illegible] treat[illegible] [illegible] may be [illegible] of treat[illegible] with this problem. Therapeutic ambition [illegible] make us feel unsatisfied with these results, but after all we have the examples of tuberculosis and lupus before us, which teach us that one can only meet with success if the treatment is adapted to the character of the disease.

I have told you that psycho-analysis began as a therapeutic procedure, but it is not in that light that I wanted to recommend it to your interest, but because of the truths it contains, because of the information it gives us about that which is of the greatest importance to man, namely his own nature, and because of the connections it has shown to exist between the most various of his activities. As a form of therapy it is one among many, though certainly *prima inter pares*.[1] If it had no therapeutic value, it would not have been discovered from clinical material and would not have continued to develop for more than thirty years.

LECTURE 35

A PHILOSOPHY OF LIFE

LADIES AND GENTLEMEN, In the last lecture we were occupied with trivial everyday affairs, with putting, as it were, our modest house in order. We will now take a bold step and risk an answer to a question which has repeatedly been asked in [illegible]analytic quarters, namely the question whether psycho-analysis leads to any particular *Weltanschauung*, and if so to what.

Weltanschauung is, I am afraid, a specifically German notion, which it would be difficult to

[1] Chief among equals.—Ed.

translate into a foreign language. If I attempt to give you a definition of the word it can hardly fail to strike you as inept By *Weltanschauung* then I mean an intellectual construction which gives a unified solution of all the problems of our existence in virtue of a comprehensive hypothesis a construction therefore in which no question is left open and in which everything in which we are interested finds a place It is easy to see that the possession of such a *Weltanschauung* is one of the ideal wishes of mankind When one believes in such a thing one feels secure in life one knows what one ought to strive after and how one ought to organize one s emotions and interests to the best purpose

If that is what is meant by a *Weltanschauung* then the question is an easy one for psycho analysis to answer As a specialized science a branch of psychology—depth psychology or psychology of the unconscious—it is quite unsuited to form a *Weltanschauung* of its own it must accept that of science in general The scientific *Weltanschauung* is however markedly at variance with our definition The *unified* nature of the explanation of the universe is it is true accepted by science but only as a program whose fulfilment is postponed to the future Otherwise it is distinguished by negative characteristics by a limitation to what is at any given time knowable and a categorical rejection of certain elements which are alien to it It asserts that there is no other source of knowledge of the universe but the intellectual manipulation of carefully verified observations in fact what is called *research* and that no knowledge can be obtained from revelation intuition or inspiration It appears that this way of looking at things came very near to receiving general acceptance during the last century or two It has been reserved for the present century to raise the objection that such a *Weltanschauung* is both empty and unsatisfying that it overlooks all the spiritual demands of man and all the needs of the human mind

This objection cannot be too strongly repudiated It cannot be supported for a moment for the spirit and the mind are the subject of scientific investigation in exactly the same way as any non human entities Psycho analysis has a peculiar right to speak on behalf of the scientific *Weltanschauung* in this connection because it cannot be accused of neglecting the part occupied by the mind in the universe The contribution of psycho analysis to science consists precisely in having extended research to the region of the mind Certainly without such a psychology science would be very incomplete But if we add to science the investigation of the intellectual and emotional functions of men (and animals) we find that nothing has been altered as regards the general position of science that there are no new sources of knowledge or methods of research Intuition and inspiration would be such if they existed but they can safely be counted as illusions as fulfilments of wishes It is easy to see moreover that the qualities which as we have shown are expected of a *Weltanschauung* have a purely emotional basis Science takes account of the fact that the mind of man creates such demands and is ready to trace their source but it has not the slightest ground for thinking them justified On the contrary it does well to distinguish carefully between illusion (the results of emotional demands of that kind) and knowledge

This does not at all imply that we need push these wishes contemptuously aside or underestimate their value in the lives of human beings We are prepared to take notice of the fulfilments they have achieved for themselves in the creations of art and in the systems of religion and philosophy but we cannot overlook the fact that it would be wrong and highly inexpedient to allow such things to be carried over into the domain of knowledge For in that way one would open the door which gives access to the region of the psychoses whether individual or group psychoses and one would drain off from these tendencies valuable energy which is directed towards reality and which seeks by means of reality to satisfy wishes and needs as far as this is possible

From the point of view of science we must necessarily make use of our critical powers in this direction and not be afraid to reject and deny It is inadmissible to declare that science is one field of human intellectual activity and that religion and philosophy are others at least as valuable and that science has no business to interfere with the other two that they all have an equal claim to truth and that every one is free to choose whence he shall draw his convictions and in what he shall place his belief Such an attitude is considered particularly respectable tolerant broad minded and free from narrow prejudices Unfortunately it is not tenable it shares all the pernicious qualities of an entirely unscientific *Weltanschauung* and in practice comes to much the same thing The

..re fact is that truth cannot be tolerant and ..not admit compromis or lim tat ns, that cient..c research looks on the wh le field of ..m..n acti ty as its wn and m..u t dopt an ..ncom..rom..ingly critical attitude towards any o..e power that eeks to usurp any part of its province.

Of the three forces which can dispute the position f science religion alone a really erous enemy Art is almo t always harmle s and beneficent t does not seek to be anything else bu.. .n illusio S in the ca..e of a few people who re, one might say obsessed by A. t never dares to make any attacks on the realm of reality Philos phy is not opposed to science t beha es itself as f t were a science and to a certain extent t makes use of th sam m thods b t it p rts company with science in that it lings to the illus o that it can produce a complete and coh rent p cture f the universe, thou..h in f ct that p cture must eeds fall to p eces with every new ad ..n e in our knowledge Its methodological erro lies in the fact that it over-estimates the ep..s em logical ..al e of ou logical operat ons a d to a certain extent dmits the ..alid ty of other sources of knowledge such as intuition And often enough one feels that the poet Heine is ot unj tified when he says of the phil opher

With his gh-cap d k night hirt t tters
H b t k p th l p-h le th tructure f
th world

But philos phy has n immediat influence on th great majority f mankind t terests only a small numbe en of the thin upper stratum of intellectuals whil all the rest find it beyond them. In co tradistincti n to phi losophy ligion s a tremend us force which exerts ts power over th st ongest emotions of human beings As we know at ne time t in cluded everything that played any part in the mental life of mankind, that t took th place of sci ce when as y t science h rdly existed and that t built up W eltan h ung of in comparable co ..tency and cohe enc whi h, although t has been sev rely haken has lasted to this day

If on wi..he to form tru estimate of the full grand ur of relig on must keep in mind what it und rtakes t d f men It gi es them information bout th ource and origin f the uni rs t assure them f p o- tection and final happiness amid the changing ci..s tudes of lif and it guides their thoughts and actio s by means of precepts wh ch are backed b the whole force of its authority It fulfils therefore three funct ons In the f rst place it at fies man s des re for knowledge it is here doing the same th .. th t science attempts to accomplish by its own methods and here therefore enters into ri alry wi h it. It is to the second function that it pe forms that r l ..ion no doubt owes the greater part of its influence In so far as rel ..ion bru..hes away men s fear of the dangers and vicis tudes of l fe in so far as it assures them of a happy ending and comforts them in their misf r tunes science cannot compete with it. Science it is true teaches how one can a..o d certain dangers and how one can combat many suf er ings with uccess it would be qu..te untrue to d..ny b..t cience is a powerful a d to human .. them ..ers to ..mance ..ecepts of its third function the pr.. .. prohib t ons, and restrictions religion is fur thest removed from science For sc ence is con tent with discovering and tating the facts It is true th t, from the appl cations of sc ence rules and recommendations for beha ..our may be deduced. In certain circumstances they may be th same as those which are laid down by religion, but even so the reasons for them will be diff rent.

It s not quite clear why reli..ion should combine these three functio s. What has the explanat on of the origin of the un erse to do with the inculcation of certa n eth cal pre cepts? Its assurances of protection and hap- piness are m re clos ly connected with these pr cepts They ar the reward f r the fulfil ment of the commands only h who obeys them can count o cei ing these benefits while puni hment awaits the d s bed ent For the matte of that omething of the same k d applies to ence f r t d cla es that ny one who dis egard ts inf ences is li ble to suffe for it.

One can only under tand this rem kable combination of teaching consolati n and pre cept in reli.. f one subjects it to genetic analys s We m y begin w ..h the most remark abl item of th th e the teaching abo t the origin f the uni erse—for why sh uld a cos- mog y be a regula element of rel gious sys t ms Th doctrine is th t th un ..erse was created by a be g s mil r t man but gr ater in ev ry espect in power w sdom and strength of pass on in fact by an dealized superman.

Where you have animals as creators of the universe you have indications of the influence of Totemism which I shall touch on later at any rate with a brief remark It is interesting to notice that this creator of the universe is always a sin le god even when many gods are believed in Equally interesting is the fact that the creator is nearly always a male although there is no lack of indication of the existence of female deities and many mythologies make the creation of the world begin precisely with a male god triumphing over a female goddess who is degraded into a monster This raises the most fascinating minor problems but we must hurry on The rest of our enquiry is made easy because this God Creator is openly called Father Psycho analysis concludes that he really is the father clothed in the grandeur in which he once appeared to the small child The re li ious man s picture of the creation of the universe is the same as his picture of his own creation

If this is so then it is easy to understand how it is that the comforting promises of protection and the severe ethical commands are found together with the cosmogony For the same individual to whom the child owes its own existence the father (or more correctly the parental function which is composed of the father and the mother) has protected and watched over the weak and helpless child exposed as it is to all the dangers which threaten in the external world in its father s care it has felt itself safe Even the grown man though he may know that he possesses greater strength and though he has greater insight into the dangers of life rightly feels that fundamentally he is just as helpless and unprotected as he

n h ld

e has enjoyed as a child But he has long ago realized that his father is a being with strictly limited powers and by no means endowed with every desirable attribute He therefore looks back to the memory image of the ov rrated father of his childhood exalts it into a deity and brings it into the present and into reality The emotional strength of this memory image and the lasting nature of his need for protection re the two supports of his belief in God

The third main point of the reli ious pro gram its ethical precepts can also be related without any difficulty to the situation of child hood In a famous passage which I have al ready quoted in an earlier lecture the philoso- pher Kant spe ks of the starry heaven above u and the moral law within us as the stronge t evidence for the greatness of God However odd it may sound to put these two side by side—for what can the heavenly bodies have to do with the question whether one man loves another or kills him?—nevertheless it touches on a gre t

(the par

life and

that life ... s also taught it what it may or may not do made it accept certain limitations of its instinctual wishes and told it what con sideration it would be expected to show to wards its parents and brothers and sisters if it wanted to be tolerated and liked as a member of the family circle and later on of more ex tensive groups The child is brought up to know its social duties by means of a system of love rewards and punishments and in this way it is taught that its security in life depends on its parents (and subsequently other people) loving it and being able to believe in its love for them This whole state of affairs is carried over by the grown man unaltered into his re ligion The prohibitions and commands of his parents live on in his breast as his moral con science God rules the world of men with the help of the same system of rewards and punish ments and the degree of protection and happi ness which each individual enjoys depends on his fulfilment of the demands of morality the feeling of security with which he fortifies him self against the dangers both of the external world and of his human environment is founded on his love of God and the consciou ness of God s love for him Finally he has in prayer a direct influence on the divine will and in that way insures for himself a share in the divine omnipotence

I am sure that while you have been li ten in to me a whole host of questions must have come into your minds which you would like to have answered I cannot undertake to do o here and now but I am perfectly certain that none of these questions of detail would hake our thesis that the religious *Weltanschauung* is determined by the situat on th at sub isted in our ch ldhood It is therefore all the more re markable that in spite of its infantile char acter it nevertheless has a forerunner There was without doubt a time when there were no religions and no gods It is known as the *age of anim sm* Even at that time the world was full of spirits in the semblance of men (demons as we call them) and all the objects in the ex

[illegible] world we e the r dwelling place or per [illegible] identical w th them but there was no [illegible] power wh ch had cre ted them all [illegible] ch co tr lled them and to wh ch it was [illegible] to turn for protection a d aid The [illegible] of an m m were u uall host le to man but [illegible] s tho h ma had mo e confidence in him elf in tho e days than Later on. He was n d b n co t nt t rror f these evil spi s but he def nded him elf aga nst them by mea of certa n act ns to wh ch he ascr bed t e po e t dri e them away Nor did he th h mself e t ely powe less i other w s. If he wanted somethin f om nature—rain for t ce—he did not direct a pra er t t weathe god but u ed spell by mean f hich he expected to exert d rect influence over ture he himself made someth wh ch resembled rain I his fight aga st the powe s f the rr undi g world his first we pon w magic, the first fo erunn r of our modern t ch [illegible]

We suppo e that this confidence n magic is deri ed from the o restimati of the indi dual s own intellectual operat ons from the belief in the *om potence of thoughts* which, incidentally we c me across again in our obse onal neu ot es W m y imagine that the men of that tim were particula ly p ud f their qu ti n of peech wh ch mu t ha e been cc mpanied by a g eat f c litat n f th ught. They ttributed magic powe to the spoken w rd. This feature w s later taken ove by relig And God sa d Let th re be light, and th re wa light But the fact f m ct on sh ws th t an mistic man did t ly enti ely on th forc f his own wishes On the contrary h depe ded f r u cess upo the performa f an tion, wh h would use N tur t m t t t If h wanted t to ram h him lf poured t wat f he wanted t timulat th soil to fertility he f f ed t perf rman e f exual inte course in the fi lds

[illegible] k w h w t nacio ly an thi g that has once found psy h l c l exp ess n pe sts You will th ref re t be urprised t hea that a gre t many m nifestat on f a mism ha e lasted up t th p esent day mostly a what are called *perst tion* sid by ide w th and behind reli B t m e than that y can hardly o d coming t th onclusio that ur philosophy has preserved ential tra t f mist modes f th ught ch th overestimation f th magic f words and th bel f that real pro es es in th ext rnal w ld f low th h la d down by our thoughts It is to be sure an an mism w thout magical prac t ces On th ther ha d we sh u d xpect to find that in the s e of animism there mu t al ready ha e been ome k nd of mo ality some rules gov rn ng the interc urse of men with one another But there i no evidence that they w re closely bound up w th an m stic beliefs Probably they were the immediate expression of the distribut n of power and of practical neces ities

It would be very int resting to know what determ ned the transit on from animism to re l g on but you may imagi in what darkness th s earl e t epoch in the ev lut on f the human m d is still shrouded It eems to be a fact that the ea l est form in wh ch rel gion appeared was the rema kable one f totem m the worsh p f an mals in th tra n of wh ch foll wed the first eth cal commands the taboos In a book c lled *To em a d Taboo* I once wo ked out a suggest on in accordance with which th cha ge is to be traced back to an uphea al in the rel t o sh ps in the human fam ly The main achievement of rel gion, as compared w th a im sm lie in the psych c bi ding of the fe r of demons Nevertheless, th ev l sp rit s ill has a place in th rel gious system as a rel c of the previ us age

So m ch for the pre hi tory of the rel gi *Weltanschauung* Let us now turn to consider wh t ha happened since and what is st ll g g on und r our own eyes Th scient fic sp rit st engthened by the observation of nat ral p oces es began in th ours of t me to treat relig n as a hum n matter and to subject it to a crit cal exami at o Th s test it failed to p ss In th first place the accounts f m les rou ed a feeling of urp i and d sbel f ince th y c trad cted everyth g th t ober ob rvati n had taught and bet yed all too lea l the influence of human imaginat n In th next plac ts cc u t of the nature of the [illegible] howed [illegible] bo e [illegible] own t increa g familiarity w th th s of na ture t had lo t ts a th rit The d that the universe came int being thro gh an ct of wh h

Where you have animals as creators of the universe you have indications of the influence of Totemism which I shall touch on later at any rate with a brief remark It is interesting to notice that this creator of the universe is always a single god even when many gods are believed in Equally interesting is the fact that the creator is nearly always a male although there is no lack of indication of the existence of female deities and many mythologies make the creation of the world begin precisely with a male god triumphing over a female goddess who is degraded into a monster This raises the most fascinating minor problems but we must hurry on The rest of our enquiry is made easy because this God Creator is openly called Father Psycho analysis concludes that he really is the father clothed in the grandeur in which he once appeared to the small child The religious man s picture of the creation of the universe is the same as his picture of his own creation

If this is so then it is easy to understand how it is that the comforting promises of protection and the severe ethical commands are found together with the cosmogony For the same individual to whom the child owes its own existence the father (or more correctly the parental function which is composed of the father and the mother) has protected and watched over the weak and helpless child exposed as it is to all the dangers which threaten in the external world in its father s care it has felt itself safe Even the grown man though he may know that he possesses greater strength and though he has greater insight into the dangers of life rightly feels that fundamentally he is just as helpless and unprotected as he was in childhood and that in relation to the external world he is still a child Even now therefore he cannot give up the protection which he has enjoyed as a child But he has long ago realized that his father is a being with strictly limited powers and by no means endowed with every desirable attribute He therefore looks back to the memory image of the overrated father of his childhood exalts it into a deity and brings it into the present and into reality The emotional strength of this memory image and the lasting nature of his need for protection are the two supports of his belief in God

The third main point of the religious program its ethical precepts can also be related without any difficulty to the situation of childhood In a famous passage which I have already quoted in an earlier lecture the philosopher Kant speaks of the starry heaven above us and the moral law within us as the strongest evidence for the greatness of God However odd it may sound to put these two side by side—for what can the heavenly bodies have to do with the question whether one man loves another or kills him?—nevertheless it touches on a great psychological truth The same father (the parental function) who gave the child his life and preserved it from the dangers which that life involves also taught it what it may or may not do made it accept certain limitations of its instinctual wishes and told it what consideration it would be expected to show towards its parents and brothers and sisters if it wanted to be tolerated and liked as a member of the family circle and later on of more extensive groups The child is brought up to know its social duties by means of a system of love rewards and punishments and in this way it is taught that its security in life depends on its parents (and subsequently other people) loving it and being able to believe in its love for them This whole state of affairs is carried over by the grown man unaltered into his religion The prohibitions and commands of his parents live on in his breast as his moral conscience God rules the world of men with the help of the same system of rewards and punishments and the degree of protection and happiness which each individual enjoys depends on his fulfilment of the demands of morality the feeling of security with which he fortifies himself against the dangers both of the external world and of his human environment is founded on his love of God and the consciousness of God s love for him Finally he has in prayer a direct influence on the divine will and in that way insures for himself a share in the divine omnipotence

I am sure that while you have been listening to me a whole host of questions must have come into your minds which you would like to have answered I cannot undertake to do so here and now but I am perfectly certain that none of these questions of detail would shake our thesis that the religious *Weltanschauung* is determined by the situation that subsisted in our childhood It is therefore all the more remarkable that in spite of its infantile character it nevertheless has a forerunner There was without doubt a time when there were no religions and no gods It is known as the *age of animism* Even at that time the world was full of spirits in the semblance of men (demons as we call them) and all the objects in the ex

ng into this conflict I understand we may perhaps arrive at a clearer understanding of our attitude towards the *Weltanschauung*. You will see how easily some of the arguments which are brought forward by the supporters of religion can be disproved though others may succeed in escaping refutation.

The first objection that one hears is to the effect that it is an impertinence on the part of science to take religion as a subject for its investigations since religion is something supreme, something superior to the capacities of the human understanding something which must not be approached with the sophistries of criticism. In other words science is not competent to sit in judgment on religion. No doubt it is quite useful and valuable so long as it is restricted to its own province but religion does not lie in that province and with religion it can have nothing to do. If we are not deterred by this brusque dismissal but enquire on what grounds religion bases its claim to an exceptional position among human concerns the answer we receive if indeed we are honoured with an answer at all, is that religion cannot be measured by human standards since it is of divine origin and has been revealed to us by a spirit which the human mind cannot grasp. It might surely be thought that nothing could be more easily refuted than this argument. It is an obvious *petitio principii* a begging of the question. The point which is being called in question is whether there is a divine spirit and a revelation and it surely cannot be a conclusive reply to say that the question cannot be asked, because the Deity cannot be called in question. What is happening here is the same kind of thing as we meet with occasionally in our analytic work. If an otherwise intelligent patient denies a suggestion on particularly stupid grounds his imperfect logic is evidence of the existence of a particularly strong motive for his making the denial, a motive which can only be of an affective nature and serve to bind an emotion.

Another sort of answer may be given in which a motive of this kind is openly admitted. Religion must not be critically examined, because it is the highest, most precious and noblest thing that the mind of man has brought forth, because it gives expression to the deepest feelings and is the only thing that makes the world bearable and life worthy of humanity. To this we need not reply by disputing this estimate of religion, but rather by drawing attention to another aspect of the matter. We should point out that it is not a question of the scientific spirit encroaching upon the sphere of religion, but of religion encroaching upon the sphere of scientific thought. Whatever value and importance religion may have, it has no right to set any limits to thought and therefore has no right to except itself from the application of thought.

Scientific thought is in its essence no different from the normal process of thinking which we all, believers and unbelievers alike, make use of when we are going about our business in everyday life. It has merely taken a special form in certain respects: it extends its interest to things which have no immediate obvious utility, it endeavours to eliminate personal factors and emotional influences, it carefully examines the trustworthiness of the sense

[illegible]

purposely varied experimentation. It aims at arriving at correspondence with reality, that is to say with what exists outside us and independently of us and, as experience has taught us, is decisive for the fulfilment or frustration of our desires. This correspondence with the real external world we call *truth*. It is the aim of scientific work, even when the practical value of that work does not interest us. When therefore religion claims that it can take the place of science and that because it is beneficent and ennobling it must therefore be true, that claim is, in fact, an encroachment which, in the interests of every one, should be resisted. It is asking a great deal of a man who has learned to regulate his everyday affairs in accordance with the rules of experience and with due regard to reality that he should entrust precisely what affects him most nearly to the care of an authority which claims as its prerogative freedom from all the rules of rational thought. And, as for the protection that religion promises its believers, I hardly think that any of us would be willing even to enter a motor-car if the driver informed us that he drove without allowing himself to be distracted by traffic regulations but in accordance with

[illegible]

both for the individual and for society. Analytic experience has taught us that such prohibitions even though they were originally

look the influence of the comparative study of different religious systems and the impression they give of mutual exclusiveness and intolerance

Fortified by these preliminary efforts the scientific spirit at last summoned up courage to put to the test the most important and the most emotionally significant elements of the religious *Weltanschauung* The truth could have been seen at any time but it was long before any one dared to say it aloud the assertions made by religion that it could give protection and happiness to men if they would only fulfil certain ethical obligations were unworthy of belief It seems not to be true that there is a power in the universe which watches over the well being of every individual with parental care and brings all his concerns to a happy ending On the contrary the destinies of man are incompatible with a universal principle of benevolence or with—what is to some degree contradictory—a universal principle of justice Earthquakes floods and fires do not differentiate between the good and devout man and the sinner and unbeliever And even if we leave inanimate nature out of account and consider the destinies of individual men in so far as they depend on their relations with others of their own kind it is by no means the rule that virtue is rewarded and wickedness punished but it happens often enough that the violent the crafty and the unprincipled seize the desirable goods of the earth for themselves while the pious go empty away Dark unfeeling and unloving powers determine human destiny the system of rewards and punishments which according to religion governs the world seems to have no existence This is another occasion for abandoning a portion of the animism which has found refuge in religion

The last contribution to the criticism of the religious *Weltanschauung* has been m d h

n

u issues and needs of childhood into maturity This does not precisely imply a refutation of religion but it is a necessary rounding off of our knowledge about it and at least on one point it actually contradicts it for religion lays claim to a divine origin This claim to be sure is not false if our interpretation of God is accepted

Wel

the

as to which of them is in possession of the truth in our view the truth of religion may be altogether disregarded Religion is an attempt to get control over the sensory world in which we are placed by means of the wish world which we have developed inside us as a result of biolo ical and psychological necessities But it cannot achieve its end Its doctrines carry with them the stamp of the times in which they originated the ignorant childhood days of the human race Its consolations deserve no trust Experience teaches us that the world i not a nursery The ethical command to which re li ion seeks to lend its weight require some other foundations instead for human ociety cannot do without them and it is dangerous to link up obedience to them with religious belief If one attempts to assign to religion its place in man s evolution it seems not m h

I

of course perfectly free to criticise this account of mine and I am prepared to meet you half way What I have said about the gradual crumbling of the rel gious *Weltanschauung* was no doubt an incomplete abridgement of the whole story the order of the separate events was not quite correctly given and the co-operation of various forces towards the awakening of the scientific spirit was not traced I have also left out of account the alterations which occurred in the religious *Weltanschauung* itself both durin the period of its unchallenged authority and afterwards under the influence of awakening criticism Finally I have strictly speaking limited my remarks to one single form of religion that of the Western peoples I have as it were constructed a lay figure for the purposes of a demonstration which I desired to be as rapid and as impressive as possible Let us leave on one side the question of whether my knowledge would in any case have been sufficient to enable me to do it better or more completely I am aware that you can find all that I have said elsewhere and find it better said none of it is new But I am firmly convinced that the most careful elaboration of the material upon which the problems of religion are based would not shake these conclusions

As you know the stru gle between the scientific spirit and the religious *Weltanschauung* is not yet at an end it is still go ng on under our very eyes today However little psycho-analysis may make use as a rule of polemical weapons we will not deny ourselves the pleasure of look

m, mto this conflict. Inc dentally we may per haps arri e at a clearer understanding of our a..t towards the *Weltanschauung* You will ee how ea ly ome of the arguments hich are brought *forward* by the supporters of re.igion can be disproved thou.h others m y ceed in escaping refutation.

The first objectio that one hears is to the ffect that t is an impert nence on th part of scien e to take religion as a s bject for its investigations since r ligion is someth ng su preme something superior to the cap c t es of the human und rstand g somethin which must not be app oached with the soph stries of —

confined to some particular field have a tendency to spread and then become the cause of severe inhibitions in people's lives In women a process of this sort can be observed to follow from the prohibition against their occupying themselves even in thought with the sexual side of their nature The biographies of almost all the eminent people of past times show the disastrous results of the inhibition of thought by religion Intellect on the other hand—or rather to call it by a more familiar name reason—is among the forces which may be expected to exert a unifying influence upon men —creatures who can be held together only with the greatest difficulty and whom it is therefore scarcely possible to control Think how impossible human society would be if every one had his own particular multiplication table and his own private units of weight and length Our best hope for the future is that the intellect—the scientific spirit reason—should in time establish a dictatorship over the human mind The very nature of reason is a guarantee that it would not fail to concede to h [illegible]

[illegible] ie exercised by such a domination of reason would prove to be the strongest unifying force among men and would prepare the way for further unifications Whatever like the ban laid upon thought by religion opposes such a development is a danger for the future of mankind

The question may now be asked why religion does not put an end to this losing fight by openly declaring It is a fact that I cannot give you what men commonly call truth to obtain that you must go to science But what I have to give you is incomparably more beautiful more comforting and more ennobling than anything that you could ever get from science And I therefore say to you that it is true in a different and higher sense The answer is easy to find Religion cannot make this admission because if it did it would lose all influence over the mass of mankind The ordinary man knows only one *truth*—truth in the ordinary sense of the word What may be meant by a higher or a highest truth he cannot imagine Truth seems to him as little capable of having degrees as death and the necessary leap from the beautiful to the true is *one* that he cannot make Perhaps you will agree with me in thinking that he is right in this

The struggle therefore is not yet at an end The followers of the religious *Weltanschauung* act in accordance with the old maxim the best defence is attack What they ask is this science that presumes to depreciate our religion which has brought salvation and comfort to millions of men for many thousands of years? What has science for its part so far accomplished? What more can be expected of it? On its own admission it is incapable of comforting or ennobling us We will leave that on one side therefore though it is by no means easy to give up such benefits But what of its teaching? Can it tell us how the world began and what fate is in store for it? Can it even paint for us a coherent picture of the universe and show us where the unexplained phenomena of life fit in and how spiritual forces are able to operate on inert matter? If it could do that we should not refuse it our respect But it has done nothing of the sort not one single problem of this kind has it solved It gives us fragments of alleged knowledge which it cannot harmonize with one another it collects observations of uniformities from the totality of events and dignifies them with the name of *laws* and subjects them to its hazardous interpretations And with what a small degree of certitude does it establish its conclusions! All that it teaches is only provisionally true what is prized today as the highest wisdom is overthrown tomorrow and experimentally replaced by something else The latest error is then given the name of truth And to this truth we are asked to sacrifice our highest good!

Ladies and Gentlemen—in so far as you yourselves are supporters of the scientific *Weltanschauung* I do not think you will be very profoundly shaken by this critic's attack In Imperial Austria an anecdote was once current which I should like to call to mind in this connection On one occasion the old Emperor was receiving a deputation from a political party which he disliked This is no longer ordinary opposition he burst out this is factious opposition In just the same way you will find that the reproaches made against science for not having solved the riddle of the universe are unfairly and spitefully exaggerated Science has had too little time for such a tremendous achievement It is still very young a recently developed human activity Let us bear in mind to mention only a few dates that only about three hundred years have passed since Kepler discovered the laws of planetary movement the life of Newton who split up light into the colours of the spectrum and put forward the theory of gravitation came to end in 1727 that is to say a little more than two hundred years ago and Lavoisier discovered

emgen ..ortly bef re the Fre ch Revolution I may be a very ld man today but the life of — — h t omp n on

coverer of radium was born And if you go back to t beg n s of exact natural science among the Greeks t A chimedes or to Aristarchus of Samo (around 50 B C.) the forerunner of Copern cus or e en to the tentat ve erms of a tron my mo g the Babyl n ns you wul onl be co erin ery mall portion of th pen which a thropology requ res for the evolution of man from hi origi al ape like form, a pe od which certainly embraces more than a hundred thousand years And it must not be f rgotten that the last century has brought with it such a quantity of new discoveries d such a great acc lerat on f scientific progress that we ha e every rea on to look forward w th confide ce to the future f science.

It has to be adm tted that the oth r objections re val d within certain l mit Thus t is true th th path of science is sl w tent t ve a labo us That cannot be den ed or alt ed N and that th gentleme of the oppo i n are d a ed they re spo lt they ha e had an easier time of t wi h their revelat on Progress in scientific work s made in just the ame way as in anal The a alyst brings expec tations h him to his work but h mu t keep them in th backgr und H di co ers s me thing ew b o servati now here a d ow the a d t first t e b ts d not fit togeth H puts forward uppo t ns he brin con c on. to one d, and gi s them up f they a e t confirmed h m t ha e a great deal of pat ence must be p epared fo all pos sibilities and m t n t j mp at co clusions f r fear f thei leadin him to o l k new a d unexpected factors And in the end th whole expenditure of ff rt s ewarded th scattered discoveries fall into place a d h obtain n understanding of a wh l chain of mental even he has fini hed o e p ece of w k a d is ready fo th n xt B t the an lyst s u l ke other scienti wo kers th one respect that he h t d witho t the h lp wh ch ex periment can bring to esea h

But the criticism of s ence which I ha e quoted also contains gre t d al of gg r a ion I s n t true to say that t swings bli dly from one t empt to a o h and h ges en err fo th next. As a rul the man of science works l ke a sculptor with a clay model who pers stentl alters th f rst rou h sketch adds to it and takes away from it until he has obtai ed a at factory degree of s milarity to some object whether seen or imagined And moreover at least in the older and more mature scie ces there is already a sol d *foundat on of* knowledge which is now only mod fied and elaborated and no long r d moli hed The outlook in fact is not so bad in the world of cience

And finally wha is the purpose of all these pa onate di paragements of science? In sp e of its present i completeness and its i he nt difficulties we could not do without it and could not p t n thi g else n its place There is no lim t to the impro ement of which it is capable and th s can certai ly not be said of the re l gious *W lta cha n* The latter is com lete in its essentials if it s an error it must re main one for ever No attempt to minimize the importance of science can alt r the fact that it att mpts to take into account our dependence o the re l extern l world while religion i illusion and it derives its strength from the *fact that it falls in with our insti ctual de res*

I must now go on to m ntion some othe types of *W eltanscha ung* h ch are in opposi tio to the sc ent fic one I do o howe er un ll ngly becau e I know that I am ot com petent to form a judgment upon them I hope the f e that you will bear thi confess n in m d n l ten g to what I ha e to say a d that f ur interest aroused you ll go else whe e fo m re tru tworthy nformation

In th first pla e I o ht at th s point to n me th ario s ph losoph c l sy tems wh ch ha e entured to d w a p ct e of the world s t refl cted n th m ds of th k s whose ey s are as a rule t rn d away fr m t But I have already att mpted to gi e a general ch acteri at o of phil ophy d its methods a d I bel e e I am mo unfitt d than almo t ny o t p s the ind idu l systems und revi w I shall a k y u therefore instead to turn your attent t two ther phenomena which par *ticularly* n th e da s cannot be igno ed

The *W elt ns h ung* to which I shall first refer is it were c unterpart of political an chism, and m y pe haps ha e eman ted f m t No d bt th re have been intellectual h l ts of this kind b f e b t at the present da the theory of relati ity f m d rn ph s cs seems t ha e go e t th heads. It s tru that th sta t ut f om s ence but they suc ce d in fo ing it to cut the ground f om under

contradictions and obscurities than these earlier holy books

And although practical Marxism has remorselessly swept away all idealistic systems and illusions it has nevertheless developed illusions itself which are no less dubious and unverifiable than their predecessors It hopes in the course of a few generations so to alter men that they will be able to live together in the new order of society almost without friction and that they will do their work voluntarily In the meantime it moves elsewhere the instinctual barriers which are essential in any society it directs outwards the aggressive tendencies which threaten every human community and finds its support in the hostility of the poor against the rich and of the hitherto powerless against the former holders of power But such an alteration in human nature is very improbable The enthusiasm with which the mob follow the Bolshevist lead at present so long as the new order is incomplete and threatened from outside gives no guarantee for the future when it will be fully established and no longer in danger In exactly the same way as religion Bolshevism is obliged to compensate its believers for the sufferings and deprivations of the present life by promising them a better life hereafter in which there will be no unsatisfied needs It is true that this paradise is to be in this world it will be established on earth and will be inaugurated within a measurable time But let us remember that the Jews whose religion knows nothing of a life beyond the grave also expected the coming of the Messiah here on earth and that the Christian Middle Ages constantly believed that the Kingdom of God was at hand

There is no doubt what the answer of Bolshevism to these criticisms will be Until men have changed their nature it will say one must employ the methods which are effective with them today One cannot do without compulsion in their education or a ban upon thinking or the application of force even to the spilling of blood and if one did not awake in them the illusions you speak of one would not be able to bring them to submit to this compulsion And it might politely ask us to say how else it could be done At this point we should be defeated I should know of no advice to give I should admit that the conditions of this experiment would have restrained me and people like me from undertaking it but we are not the only ones concerned There are also men of action unshakable in their convictions impervious to doubt and insensitive to the sufferings of anyone who stands between them and their goal It is owing to such men that the tremendous attempt to institute a new order of society of this kind is actually being carried out in Russia now At a time when great nations are declaring that they expect to find their salvation solely from a steadfast adherence to Christian piety the upheaval in Russia—in spite of all its distressing features—seems to bring a promise of a better future Unfortunately neither our own misgivings nor the fanatical belief of the other side give us any hint of how the experiment will turn out The future will teach us Perhaps it will show that the attempt has been made prematurely and that a fundamental alteration of the social order will have little hope of success until new discoveries are made that will increase our control over the forces of nature and so make easier the satisfaction of our needs It may be that only then will it be possible for a new order of society to emerge which will not only banish the material wants of the masses but at the same time meet the cultural requirements of individual men But even so we shall still have to struggle for an indefinite length of time with the difficulties which the intractable nature of man puts in the way of every kind of social community

Ladies and Gentlemen—Let me in conclusion sum up what I had to say about the relation of psycho analysis to the question of a *Weltanschauung* Psycho analysis is not in my opinion in a position to create a *Weltanschauung* of its own It has no need to do so for it is a branch of science and can subscribe to the scientific *Weltanschauung* The latter however hardly merits such a high sounding name for it does not take everything into its scope it is incomplete and it makes no claim to being comprehensive or to constituting a system Scientific thought is still in its infancy there are very many of the great problems with which it has as yet been unable to cope A *Weltanschauung* based upon science has apart from the emphasis it lays upon the real world essentially negative characteristics such as that it limits itself to truth and rejects illusions Those of our fellow men who are dissatisfied with this state of things and who desire something more for their momentary peace of mind may look for it where they can find it We shall not blame them for doing so but we cannot help them and cannot change our own way of thinking on their account
